* "PRINCESS ROYAL." Tube and sepals bright red, corolla large and peculiarly bright in colour; price 5*s*. per plant.

* "MARCHIONESS OF NORMANBY." This is a large and showy flower, measuring four inches from the commencement of the pod to the termination of the pistil, tube and sepals scarlet, corolla stout, having a tinge of purple on it; price 7*s*. 6*d*. per plant.

* "LADY ALICE PEEL." A flower of good form and substance, fine rosy red tube and sepals, the latter terminating in a decided green, corolla very large and stout, of a beautiful crimson purple; price 5*s*. per plant.

* "LADY WALSINGHAM." Tube and sepals smooth, of a rosy vermilion; the latter turn up, and expose the whole of the corolla, which is stout, and of a fine purple crimson; price 5*s*. per plant. When the six are ordered, they will be charged 1*l*. 11*s*. 6*d*. the set.

"FUCHSIA QUEEN." Quite new, very beautiful, and not yet out, tube and sepals large and stout, of pure white, showing a dark crimson corolla; price 10*s*. 6*d*. p. plant; ready in April next.

Fuchsia Seed, saved from the best varieties, 6*s*. to 10*s*. per packet, with Directions for sowing, &c. &c.

VERBENAS.

*"MONARCH" (Youell's) is a delicate creamy white, surpassing in its size and fragrance every other variety; the tufts of bloom measuring from 3½ to 4 inches diameter, and will be sure to give satisfaction. Price 5*s*. per plant.

* "BRILLIANT," (Youell's). This fine variety is of the most vivid scarlet, equal in this respect to "Melindris;" the bloom, however, is three times the size, and very fragrant, and will prove most desirable in any collection. Price 3*s*. 6*d*. per plant.

*"ELEGANS" (Youell's), is a most interesting variety, being a delicate lilac, with a distinct white eye; flower large and fragrant. Price 3*s*. 6*d*. per plant.

*"SURPRISE" (Youell's), can be recommended as a variety completely novel, and one that must be cultivated in every collection, the colour being of the richest rosy crimson, or ruby, producing tufts of flowers of 3½ ins. in diameter, and delightfully fragrant. Price 5*s*. per plant.

The above four varieties have been selected from upwards of 2000 Seedlings, and may be confidently relied upon as possessing superior claims, and will be sure to give satisfaction; are now ready to send out (post-free). If the four varieties are taken, they will be charged 15*s*. the set.

ARAUCARIA IMBRICATA IN POTS.

Recently planted most extensively at Her Majesty's Gardens at Windsor, and also at the Royal Gardens, Claremont, furnished by YOUELL and Co.

YOUELL AND Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 10 inches high, 10*l*. per 100, or 30*s*. per dozen.

Fine Plants of CEDRUS DEODARA, 2ft. to 2ft. 8 ins., 10*s*. 6*d*. each.

Great Yarmouth Nursery, April 4, 1844.

N.B. All Orders above £2 will be delivered carriage free either to London or Hull.

FASTOLFF RASPBERRY.

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE MOST NOBLE THE MARQUIS OF AILSA, THE EARL OF HARRINGTON, THE EARL OF LIVERPOOL, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, LORD SONDES, &c. &c.; as well as by the HORTICULTURAL SOCIETY OF LONDON.

YOUELL AND CO. have much pleasure in announcing they are now supplying Fine Canes of the above highly-valuable and much-esteemed RASPBERRY, unequalled for the extraordinary size of its fruit and richness of flavour.

Those to whom Y. and Co. sent it last season have expressed their high admiration of its superiority over all other varieties, and has been awarded several prizes from various Horticultural Exhibitions during the season. As a proof they have not exaggerated its excellent qualities, fruit was submitted to Dr. LINDLEY, (see *Gardeners' Chronicle* of the 22d July last, page 502), whose opinion of it is as follows:—

"FASTOLFF RASPBERRY.—We have received from Messrs. YOUELL, of Great Yarmouth, fruit of the Fastolff Raspberry, and we find its merits all that has been stated in favour of its excellence. The fruit that we have received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly, and in long succession."

They also exhibited it on the 1st of August, 1843, before the London Horticultural Society, 21, Regent-street, to which a prize was awarded. It would therefore be unnecessary for YOUELL and Co. to recommend it more fully, or with greater confidence to the notice of the public, merely observing, that it continues in high perfection throughout the autumnal months, and has maintained its superiority in the most unfavourable soils and situations, and requires no other than the ordinary treatment of the old varieties.

Fine Canes are ready for delivery, and can be sent with safety to any part of the United Kingdom (on the receipt of a Post-office order), upon the following terms:—

		£	*s*.	*d*.
Packages containing 100 Canes		2	5	0
Do.	do. 50 do.	1	5	0
Do.	do. 25 do	0	14	0

Package included.

The usual discount to the Trade where not less than 200 are ordered.

☞ CAUTION.—YOUELL and Co. deem it requisite to inform their Friends and the Public in general of the fact, that other varieties of Raspberries are being offered for sale under the title of "Fastolff," and such having no pretensions whatever to the genuine variety, they beg to state they cannot be held responsible unless it has been supplied from their Nursery; neither have they appointed any Agents for the sale of it.

TWO NEW AND SUPERB PICOTEES.—"LADY ALICE PEEL," 10*s*. 6*d*., and "MRS. BENYON," 10*s*. 6*d*. per pair.—These two splendid Picotees were raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, and were kindly presented to YOUELL & Co. by that gentleman. They have already obtained Prizes at the Norfolk and Norwich Hort. Soc. Exhibitions, and Y. and Co. feel assured that no further proof of their superior merit is necessary when they refer to the eminent raiser of them.

"LADY ALICE PEEL" is a large well-formed flower, guard leaves and petals throughout of fine form and substance, and of the purest white; the lacing a delicate rose, and confined entirely to the edge. This is considered by all who have seen it to be superior to "Mrs. Barnard," or any flower of its class, and carries a beautiful long pod.

"MRS. BENYON," (red edge) also possesses every character of a first-rate Show flower, petals of splendid size, form, and substance, and the blooms expanding so correctly as not to require dressing, and carries a beautiful long pod.

FINEST CARNATIONS AND PICOTEES.

YOUELL AND Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly esteemed Flowers, which appeared on the Advertising pages, 706 and 707, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

Prices as follows:

	£.	*s*.	*d*.
12 pair of good Show Sorts	1	4	0
12 ditto fine ditto	1	10	0
25 ditto ditto	3	0	0
12 ditto extra fine and very superior ditto, including a pair of that beautiful rose-flake, "Wilson's Harriet," and all first-rate Show flowers	2	10	0
25 ditto ditto ditto	5	0	0

The selection being left to YOUELL & Co.

Great Yarmouth Nursery, April 4, 1844.

TO GARDENERS AND FLORISTS.

JAMES DICKSON & SONS, SEEDSMEN and NURSERYMEN, Edinburgh, beg to inform their numerous Friends throughout the country that they have been appointed Agents for the sale of WHITNEY'S CHEMICAL TRANSPARENT COMPOSITION for rendering Muslin, Calico, or Linen a suitable and economical substitute for Glass for Horticultural purposes. It has been very favourably noticed by Florists and Horticultural Societies throughout the country. Specimens may be seen at the Warehouse, 32, Hanover-street, or (the composition in use) at INVERLEITH NURSERIES.

Sold in Bottles (with directions for use)—pints, 2*s*. 6*d*.; quarts, 4*s*. 6*d*. each. Discount to the Trade.

J. D. and S. respectfully call the attention of their Friends to their NURSERY AND SEED CATALOGUES, which may be had on application.—April, 1844.

T. PEARSON begs to inform his Friends that he has lost the greater part of his stock of PANSIES, and cannot supply any sort at present except "Black Prince" and "Agnes," either of which will be sent post-free at 2*s*. 6*d*. each.

Chilwell Nurseries, near Nottingham.

FARM TO LET.

TO BE LET, with immediate possession, a very desirable FARM, containing about 430 Acres of Arable Pasture, and Sheep Walk well adapted for the Turnip system of Husbandry, the greater part of which is free from Tithes, lying within a ring fence, and situate in the parish of Battle, Sussex, and to which may be attached about 35 acres of good Marsh Land.

For further particulars apply to R. YOUNG, Esq., Solicitor, Battle.

Also, TO BE LET with immediate possession, a very desirable FARM, containing 254 acres of Arable and Pasture Land, including 10 Acres of Hops, in the parish of Battle, Sussex, to which 34 Acres of rich Marsh Land may be attached. Apply as above.

TO GENTLEMEN, FLORISTS, and OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to public competition, at the AUCTION MART, Bartholomew-lane, on THURSDAY, APRIL 11th, 1844, at 12 o'clock, about Three Hundred Pair of PICOTEES, the surplus stock of a first-rate collection. Also, a choice assortment of DAHLIAS, FUCHSIAS, GERANIUMS, and other flowering Plants.—May be viewed the morning of sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

HORTICULTURAL SOCIETY OF LONDON.—Notice is hereby given that the EXHIBITIONS of FLOWERS and FRUIT, in the Society's Garden, in the ensuing season, will take place on the following Saturdays, viz.—May 18, June 15, and July 13; and that Tuesday, April 16, is the last day on which Tickets are issued to Fellows of the Society, at 3s. 6d. each.

EXHIBITIONS OF FLOWERS, &c.—REGENT'S PARK.—The following are the Days appointed for the Exhibitions of PLANTS, FLOWERS, and MICROSCOPES, in the Gardens of the ROYAL BOTANIC SOCIETY OF LONDON, this season:—
TUESDAY, April 30,
TUESDAY, June 4,
TUESDAY, July 2, 1844,
When Prizes, exceeding 900l., will be distributed. Tickets for admission may be had, by orders, from Fellows or Members, at the Office, in the Gardens; price, on or before Saturday, April 13, 4s., after that day, 5s., except on the Days of Exhibition, when they will be 7s. 6d. each.
Schedules of Prizes and further particulars may be had at the Gardens. J. D. C. SOWERBY, Secretary.

FLOWER-SHOW.—The Annual Flower-Show, under the Superintendence of Mr. J. T. NEVILLE, of Ebenezer House, Peckham, will be held in the Grounds of the Almshouses of the Butcher's Charitable Institution at Walham Green, Fulham, at the latter end of June or beginning of July, of which further notice will be given. JAMES NESS, Secretary.

ANY PERSON having healthy young plants of THE CITRON (Citrus medica), THE LIME (Citrus acida), THE SHADDOCK, (Citrus decumana), or any of the larger fruited Citrus tribe, may hear of a purchaser, by addressing a line to A. Z., 6, Charles-street, Covent Garden, stating size, price, &c.

The Gardeners' Chronicle.

SATURDAY, APRIL 6, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Friday, April 12	Botanical		8 P.M.
Tuesday, April 16	Horticultural		3 P.M.
	Linnean		8 P.M.
Wednesday 17	Society of Arts		8 P.M.
	Microscopical		8 P.M.

A Fox, says the fable, having lost his tail, persuaded his companions that tails were useless, and thus it was that bobtails came in fashion. Something of this, sort must have happened to the early Pine-growers or they never could have fallen upon the strange plan of cutting off its roots to make the Pine-apple grow The preservation of roots was found difficult with the old and inefficient modes of obtaining bottom-heat; and therefore roots were voted useless.

Cut off all roots that are not fresh and healthy, says Speechly; away with straggling roots, writes Nicol; disroot, disroot, cry half-a-dozen more, for roots are only annual things, and of no use to Pines after they are a few months old. Even Baldwin, with all his skill, could not perceive the error of the practice, although he confined his disrooting to the time when his successions were taken out of the tan and transferred to pots; and Mr. Glendinning, a still better authority, speaks of disrooting as a beneficial practice; adding, however, that it suits Queens better than the black sorts. There was, however, an exception to this singular practice, in the person of Griffin, the gardener to Mr. Samuel Smith, of Woodhall, who never would allow healthy Pines to be disrooted at any time, and who beat all his contemporaries in the magnificence of his fruit, although he was some way behind the Bicton and Longleat Pine-growers of the present day.

We should be greatly puzzled to find a reason for the practice of cutting off the roots of the Pine-apple, unless it was that as the imperfect mode of obtaining bottom-heat was continually leading to the destruction of roots, and nevertheless the plants continued to grow, it was thought that the roots could be of no use, and were better removed. Just as with the Orange-tree, which, because it will bear a great deal of cold, hunger, and neglect without perishing, some people fancy cannot well have too much of such treatment. "No plant whatever that I know of," says Mr. Barnes, "is subject to more unnatural treatment, and scarcely any other plant would endure half so much ill-usage, without dying altogether. The Pine-plant is something like that unfortunate beast the donkey,—it will endure a wonderful deal of ill-usage before dying or giving in altogether."

It may be, too, that the fibres of the Pine-apple plant have been thought to be merely annual, as is even now imagined to be the case with the Strawberry; although the most common attention to facts would show that this opinion is entirely unfounded. Mr. Barnes has sufficiently exposed this prejudice in his capital paper in the "Gardeners' Magazine;" and more recently, Mr. Hamilton, whose work on Pine-growing was reviewed the other day, has devoted a chapter to the exposure of this common and fatal error. In short, it would be an affront to our readers to dwell further on that point. Disrooting will therefore be regarded hereafter as the sure mark of a bad Pine-grower; and the destruction of roots by accident in Pine-houses will be the knell of the credit of either the gardener or his apparatus.

One of the soundest maxims of cultivation is—"*Never to allow a plant to receive a check;*" to keep it growing steadily during the whole period of vegetation—to let it sink gradually to rest—to maintain it in its state of torpor without disturbance—and to rouse it gently into activity when its allotted season shall have returned. This principle is of *universal application; there is no known or probable exception to it;* and every deviation from the rule is of necessity attended more or less with injury. The odd thing is, that Pine-growers should have generally admitted its importance, and yet not have perceived that a destruction of roots must be the severest check that a plant can well receive. Checks are indeed the greatest of all the causes of mischief in Pine-houses; crowds of suckers, a fence of gills, a disproportionate crown, and similar things, arise from that circumstance; and when once they appear, good-bye to good fruit. Disrooting is the prolific mother of them.

As we have no intention of returning to this subject for the present, we may as well mention Mr. Barnes's method of preventing the excessive growth of Pine-crowns, when by any accident a plant will try to produce them. It must be obvious that, if the Pine-apple plant has to feed both its fruit and a huge tuft of leaves on the top of it, (which, as our clever friend truly says, look like a baby's head with a man's hat on,) the nourishment which the plant is capable of yielding must be divided between them, and the man's hat will be formed at the expense of the baby's face. To prevent this, from three to six days after the blooming is over, he thrusts a small knife into the centre of the crown, and gives it a twist, when out comes the centre of the heart, which checks growth without disfiguring the plant. "The fruit taking the advantage, improves in swelling amazingly, and when finished, has a nice neat little crown on it, from 2 to 3 inches high, looking, in comparison, like a well-fed happy Englishman, with a becoming hat on his head." Speechly adopted a similar practice with suckers, in order to stop their growth.

THE next faculty which ought to be found in the mind of the Landscape Gardener is that of Imitation. We all know how readily this faculty runs into abuse when powerful, and not restrained by a sense of propriety. The proper exercise of it, in the case before us, is to imitate Nature—to ask, in all cases, what would Nature do? To be able to answer that question, the Landscape Gardener is supposed to have followed the advice formerly given, to examine Nature in all her aspects, and to take heedful note of them. A clever man, on looking at a scene to be improved, can form in his mind, almost instantaneously, a view of what is required; he can see at once what the execution of his design will effect, if well carried out. Having made himself acquainted with every kind of tree and shrub that may be available, its habits, size, colour, style of growth, &c., he knows what to select, and what will suit the soil and climate. The knowledge he must acquire, in order to enable him to imitate Nature—to make Art her handmaid, is extensive. The imitative power is indispensable; but there must be also a discriminative power, to hinder it from misplacing imitations. This faculty occasionally leads to very great absurdities; and yet we should consider its gratification, and not laugh at its votaries, though, to our taste, they may have spoiled what might have been rendered agreeable.

The faculty we are next briefly to consider—that of Construction—frequently helps Imitation into the ridiculous. We recollect having somewhere seen a mass of rockwork on a great scale—a little mountain, precipitous all round, and broken through by ravines, &c.; it was quite an expedition to get up to it and travel over it. But it was out of place. It is very proper to give to rock-plants a suitable dwelling-place in a collection; but where there are no rocks, imitations of them are absurd. If they exist on grounds that are to be ornamented, rock-plants may with perfect propriety be made to grow upon them. Any feature that is grand in Nature cannot be imitated with effect where the general scene is not grand; and where the scene is naturally grand, imitations of grandeur are not needed. Unless art can be effectually concealed—unless all objects be absent that can suggest it to the mind, trouble and expense are thrown away on imitations. There are many circumstances which render art essential, and certain forms imperative; but there is some great purpose to serve, which cannot be well served without a degree of formality. All that can be done in such cases is, to avoid formality as much as possible, and to render things not positively disagreeable.

It is only with great features that Landscape Gardening has to do; and little matters may be treated in a little manner. The symmetrical is allowable, and even necessary, when we come to minor concerns. The faculty of Construction undoubtedly operates in Landscape Gardening, though, apparently, the practitioner has only to design; but in designing, the execution of the design is kept in view, else schemes might be propounded the realising of which might be impossible. It appears to facilitate the conception of how a thing may be done, and likewise how it ought to be done, when more ways than one of doing present themselves. It is intimately connected with what is called intuition, and may possibly be identical with it, for everything is constructed in the mind before the hand is set to execute. The analysis of mental power is a very interesting subject; but it would be out of place to enter on it here.

Although mere Light and Shade are necessary to bring out striking effects, Colour must be attended to. Light and Shade, we all know, when the sun shines, vary every moment; and therefore it becomes a study so to assort objects within range of the principal point of view as to bring out various good effects. Not only must we regard the diurnal motion of the sun, but his position in the ecliptic, so that when he is at various elevations and positions light may strike and shadows spread out where they may make the strongest impression on the eye. This is a point not much attended to, but one of very great value, and well deserving the closest study by the Landscape Gardener. Frequently, the admission at a particular spot of a mere streak of light enlivens a whole scene and excites the highest admiration. Sunshine through trees, when the orb itself is concealed and the rays are penetrating a thin shower falling among them, produces at times delightful effects.

To enumerate all the effects that have occurred to us in rural scenery of various kinds, especially that denominated the romantic, might occupy a goodly volume. It is impossible to exhibit an effect and to analyse the manner in which it is brought about without the help of drawings and diagrams. With a few observations on colour, and remarks on one or two collateral subjects, we shall in our next conclude what we have to say.—*G.*

FAMILIAR BOTANY.

MORPHOLOGY.—No. X.

Come sweet-lipped Zephyr and Favonius, bland!
Teach the fine seed, instinct with life, to shoot
On Earth's cold bosom its descending root;
With pith elastic stretch its rising stem,
Part the twin lobes, expand the throbbing gem.

IF the power of the Creator is wonderfully manifested in the formation of the embryo plant, out of mucilage and just-born cells, how much more admirable is the quality implanted in that embryo of developing itself into a perfect being! How marvellous the impulse which causes it to burst through the sides of its early tomb, to awaken by degrees from a death-like sleep, never again to rest, and from a wan and torpid grain to spring into that ever-changing, never-resting, gay and gaudy thing—a plant! Let us observe what we are permitted to know of the first changes that the little embryo undergoes; and for this purpose let us take the garden Mustard.

When the embryo of the Mustard is at rest it is yellow, and consists of two plano-convex scales of the consistence of an almond, upon which the radicle is folded down. The moment it begins to inhale the breath of life it softens, lengthens, bursts through the seed and begins its first change. This consists in a lengthening upwards and downwards of the small cylindrical space lying between the point of the radicle and the base of the scales; and its effect is to produce a white thread, the loose end of which forces its way downwards, drinking eagerly the moisture of the soil, while at the same time the other end rises upwards and carries the scale-like cotyledons into light and air; and while they thus are rising upwards, their solid contents are dissolved and converted into bland milk, which flows along the thread (which is the axis of growth) and sustains it in its growth, as a mother nourishes the infant at the breast. But in effecting this important purpose the scales are gradually metamorphosed, and from minute fleshy plano-convex yellow bodies they change into large thin roundish green lobes having all the texture and character of a leaf. Here, then, is a direct alteration of one thing into another wholly unlike it. The cotyledon grows into a leaf; therefore the cotyledon was a young leaf.

Next observe the garden Cress. It, too, goes through a similar series of changes in its earliest growth. The yellow fleshy scales of its embryo extend into long-stalked narrow lobes of a bright-green colour exactly of the nature of the future leaf; and, in order to show still more distinctly the identity of their nature, sometimes they are split into three pieces, just like those of the leaves to be subsequently produced.

It is true that this curious change does not take place in all embryos. In the common Pea, for example, the scales never alter their original appearance, but remain in their subterranean abode, shrivelling up and not enlarging; a circumstance which is possibly owing to their containing a much larger quantity of solid matter than the Mustard and Cress, and the conversion of which into fluid nutriment is so slow and difficult as to require, for chemical reasons, a continual detention in obscurity. But it is a principle in philosophy, which cannot be shaken, that *what is true of an organ in one plant, is true of the same organ in all other plants;* and, therefore, if it can be proved that the cotyledons of the Mustard and Cress are imperfect leaves, those of the Pea must be so regarded also. Not that it is absolutely necessary to have recourse to such reasoning in order to sustain the proposition; on the contrary, from the Pea, turn to the Kidney Bean, and therein will be found the most conclusive proof. The Kidney Bean is, in many respects, of the nature of the Pea; its embryo scales are very thick, hard, and fleshy, and slowly dissolve their solid contents, so that they have little power of thinning, expanding, and changing. They, however, differ from those of the Pea in this, that they do become green, are partially

thinned, acquire a small leaf-stalk, and actually reach an intermediate state between that of the true leaf and cotyledon.

And always thus does the young plant struggle into existence, proceeding from one state of perfection to a higher, or, as Morphologists say, from imperfection towards perfection—terms that have been cavilled at, and stigmatised as atheistical! but not used irreverently, or in the sense of materialists. It is, doubtless, true that an egg is perfect as an egg, and so is a seed as a seed; but that man must have a strangely-constituted mind, who cannot see that an egg is less perfect than the bird which is hatched within it, or a seed less perfect than the tree into which it grows. Those over-zealous persons, who, in their diseased imaginations, fancy they perceive in the Morphologist a latent Materialist, themselves exhibit the most enormous ignorance of the high attributes of the Creator. It is not necessary to be always talking of a great First Cause. In considering the works of Nature, we always deal with the facts that are plainly before us. By all men of sense it is understood that in speaking of natural phenomena an acknowledgment of the power that produces them is implied. "Il est certain," says an eminent philosopher, in writing of such things, "que tout cela est automatique; il n'y a point là d'intelligence ni de volonté. Mais derrière cet être inintelligent se trouve l'intelligence créatrice, qui a établi les admirables machines végétales qui exécutent ces mouvemens automatiques, tous dirigeés vers un but indiqué par les besoins de la plante." We recommend this sentiment to the consideration of a class of writers, to whom, if we have sometimes alluded, it has been for the sake of what, we presume, are their good intentions, but certainly not for their intelligence and sound judgment.—*R. E.*

FUCHSIAS.

(*Continued from p.* 195.)

THE last paper contained remarks on the means of obtaining an accumulative growth from one-year plants, or those potted the previous autumn, such being generally found in a state unsuited for another season's growth. The principal points were, to obtain an increased circulation of moisture by enlarging the bottom cavity of the ball externally, and to reduce the terminal shoots to a proportion commensurate with the general vigour and habit of the plant.

The treatment required for young plants, as cuttings of the current season's growth, differs in some respects. When such plants have been duly attended to in their removal from the store-pot, it is well known that their growth is more uniform and accumulative than those which have received a previous and premature rest; consequently the period of their removal from 60-size pots to larger, is limited in proportion to their condition and the habit of the variety. Nevertheless, if the cavity at the bottom is such as to indicate an impeded circulation in consequence of being closed by the position of the bottom potsherd, the cavity should be partially enlarged, as before recommended, and after the first or second top buds are pinched or cut off, it may await the fuller formation of its side or axillary growth previous to being shifted to a large 32 or 24-pot, into similar proportions and qualities of soil, as before stated. If the plants have already expanded their buds from the base of each leaf, they should be immediately shifted; and, when established, the top bud may be taken off, or more, as the variety may require.

From these remarks it may be inferred that plants, received in thumb-pots, should, if four joints long, be divested of the top bud a week or ten days previous to being removed to small or large 60s. The reasons for this are, that, as it is probable that plants when exposed to such small portions of soil are likely to be subject to opposite extremes of temperature and of moisture, so as to reduce their constitutional vigour below the possibility of accumulating it under such conditions, it is essential to shift them in proportion to their strength, that the cultivator may start them into such a growth by uniform proportions of soil, &c. (§§ 8, 9, and 10), as to enable him to give a final shift, or potting. This appears to be an essential condition of cultivation, in accordance with the principle, that "there is no arrangement of soil essential to the perfect condition of a plant, which is not proportionately essential throughout its whole period of growth." It is therefore assumed that all plants should be brought to the highest possible vigour, compatible with their existing conditions, previous to being exposed to the intense agencies of heat, moisture, &c.

With respect to the removal of foreshoots, or top buds, in order to induce a freer growth below, the following opinions are offered:—Where the buds are bursting from the base of the plant upwards, their perfect formation depends upon the removal of the plant to a larger amount of soil from the time of their first appearance, and a strong exposure to light, heat, and other essential agencies, it being understood, that to obtain splendid growth from a plant of one stem by causing an expansion of growth from the base upwards, in proportion to its height, is much more difficult than a similar width of growth from a plant of two or three stems. The first implies an approximation to its conditions of growth in nature, by very ample and uniform proportions of soil, with appropriate exposure during the first stages of growth, aided by partially inverting the leading shoot to retard the vertical flow of sap; while the second instance is illustrative of the conditions of growth by art, which obtains by a comparative result the intervention of many causes, which the former obtains by less. The first forms, in its first growth, the basis of ultimate vigour; the second reaches it by successive efforts, each exerting a negative influence on the one which preceded it.

Heath-mould has been recommended by some growers for the cultivation of the Fuchsia. I have no wish to underrate the value of this material; but when it is remembered that the qualities of Heath-mould vary as much as the indefinite qualities of loam, it must be admitted (apart from the fact that, whilst there are several natural orders of plants, to the cultivation of which Heath-mould is indispensable, there are many others, on the contrary, to which it is in no respect essential), that its application, in many instances, will depend upon its prepared texture and quality. Vegetable matter, in a highly decomposed form, being the basis of Heath-mould, is capable of holding nutritive properties longer than other soils, where silex abounds; and it is probably this quality which gives it its value in the Vegetable economy, viz. of maintaining longer than others an equilibrium of moisture in plants whose external organs are less capable of absorbing aliment from atmospheric and solar agencies.—*W. Wood, Pine-apple Place.*

(*To be continued.*)

ENTOMOLOGY.

CYNIPS QUERCUS CASTANEÆ (*the Chesnut-fruited Oak-gall-fly.*)—I have already described various galls, and the insects inhabiting them, and lately some of those created by the Aphides or Plant-lice, which excrescences are not genuine galls; and of those Hymenoptera, which are allied to the species that cause the galls of commerce; the histories of three interesting varieties have appeared in this Journal,* viz., the Oak-spangle, the Parasol-gall, and the Root-gall flies. I have now the pleasure of contributing another species, which does not appear to have been noticed in any work; and I shall feel obliged by any information regarding it, should it be discovered in this country. I unexpectedly met with these curious galls last year in the month of August, in the beautiful park and plantations near Florence, called the Reali Cascine; some Ivy was twining round the Oak which produced the galls, and at a short distance I imagined they were the flowering buds of that creeper, and it was quite accidentally that I discovered my mistake. On mentioning the subject to my friend, Professor Passerini, he informed me they were not unfrequently found in the country around Florence, and that when they were sufficiently abundant to attract the notice of the common people, they gave a singular explanation of the apparent phenomenon, namely, that the Oaks had been impregnated by the Spanish Chesnut, whose spiny young seed-vessels, these galls certainly in some measure resemble.

Here we have another instance of the absurd errors into which persons fall, from their total ignorance of the laws of Nature, which might be easily remedied by making Natural History a branch of education. I am ready to acknowledge that these curious vegetable productions were quite unknown to me, but suspecting they were the nidus of some Cynips, I gathered a few; indeed they appeared to be very scarce at that season, for I could find none on any other Oak-trees; and last February I had the satisfaction of breeding nine specimens of the fly from one of them. These Oak-galls (fig. 1) are green,

and those which I found did not exceed the size of a common Hazel-nut; they are covered with erect filaments, rather flattened, especially towards the tips, which are clubbed, of a pitchy colour, and apparently viscid; they are formed on the sides of the twigs, and are probably produced from the small buds at the base of the leaves; there were also two kidney-shaped galls arising from two other buds (fig. 2) in the branch figured; these were of an ashy-brown tint, partaking of the colour of the Bark, with smooth spots, but they have produced nothing; indeed they appeared to be solid, and were as hard as a knot of wood; yet I do not feel certain these may not be the nidus of the males, from which that sex would issue in a natural state, for, the leaves falling to the ground in the autumn, they would be kept moist during the winter, which would enable the larvæ to feed, and the flies to escape at the appointed time. This, however, is mere conjecture; and it is possible that the male eggs may be deposited in separate buds, producing distinct galls, and that they are generated at an earlier or later period; however that may be, all the specimens I have bred are females, and such is usually the case; for out of hundreds of flies that I have obtained from the galls of Cynips, Rosæ and C. Quercus radicis, I never yet bred a male. Two dark spots are exhibited in the gall (fig. 1), through which the gall-flies made their exit, by eating their way out, and there were seven other holes in different parts, proving that the cells are separated, and that each insect had to perforate its case as soon as it hatched, so that the last was not able to avail itself of the previous labours of its associates.

The female fly is similar to others of the same genus, but not being identical with any I have seen, I have named it Cynips Quercus Castaneæ, in allusion to the galls resembling the young fruit of the Spanish Chesnut. It is black, the antennæ are slightly clavate, and about as long as the head and thorax; they are composed of 13 small joints, the basal one being the stoutest, the second much smaller and oval, the third the longest and slender; the apical joint is conical; the head, thorax, and scutellum appear griseous, from the short gray hairs which are scattered over those parts; they are all minutely and thickly punctured; the eyes are oval and lateral, and on the crown are three ocelli, forming a tolerably large triangle; upon the thorax are four longitudinal grooves, two in front parallel, with one on each side, curved next the collar, and extending to the scutel, where they approximate, and nearer the lateral margin is a short one; the scutellum is nearly orbicular; the abdomen is rather smaller than the thorax, very glossy above, ochreous beneath, of an oval form, the apex conical and pointed; the ferruginous ovipositor is concealed beneath; the wings are pubescent, the upper ones, as usual, are very long and ample, the nervures are bright brown, with a minute triangular cell on the disc; the socket at the base is ferruginous; the inferior wings are small and nerveless; anterior legs ferruginous, the thighs partially, the apical joint of the feet entirely, pitchy; the other legs are of a deeper rust colour, the hinder the longest and stoutest; the coxæ are large, and piceous at the base, as are likewise the trochanters and thighs; the tibiæ and basal, as well as the apical joint of the tarsi, are blackish (fig. 3). The cross-lines show the natural size of the female; the male is unknown.—*Ruricola.*

ON THE CULTIVATION OF GRAPES IN POTS.

(*Continued from page* 197.)

After potting, the plants should be placed in some house or pit where a temperature from 60° to 80°, or 85°, is maintained; they should also be so arranged that the shoots as they advance can be trained immediately under the glass, and be exposed as much as possible to the light. The front kerbs and back shelves of Pine-pits are suitable places, and the partial shade that the Vines afford benefit the Pines during three or four of the summer months. Where there is only a Vinery they may be trained between the permanent Vines, or in any other place where the cultivator can make room for them. As the shoots advance train them carefully, and stop the laterals as they appear. When first potted the plants will want but little water, but it must be gradually increased as the pots become filled with roots; they will then require it regularly during their growth, and manure-water may occasionally be given, although the quantity they demand the first season is small in comparison to what they require afterwards. The most suitable length of cane for pots is from four to six feet, but if from any peculiarity in the house, in which they are to be fruited, a longer length may be required, they should be left accordingly, as the Vine will grow strong enough for fruiting, 8, or even 10 feet long. After it has grown a foot more than the length required the next season, it should be stopped; three or four of the upper laterals, however, may be allowed to grow at a few joints, to prevent the topmost eyes breaking. Manure-water may now be applied to cause the buds to swell, and care must be taken to preserve the principal leaves, as they are now performing a most important part in regard to the crop next season. When the wood appears to be turning brown (or ripening), water should only be applied to prevent the Vines flagging, the laterals should be taken off, and every means should be employed to ripen the wood perfectly. Indeed if it is not convenient to allow a large admission of air when they are growing, it would benefit them much by removing them to a cool house, where they would have the benefit of more air and a lower temperature at night. By the beginning of September, if the former directions have been followed, the Vines will be ripe enough to place out of doors. The north side of a wall is the best place, and the pots should be laid on their sides, and every means taken to throw the plants into a state of rest; the cultivator will thus find himself in possession of Vines which for strength and vigorous habits may justly be mistaken for older plants.

It will be seen, then, that the principles acted on above are, selecting properly matured wood for cuttings—inserting only one eye in each pot to prevent any check to the plant in repotting—placing them at once in the pot in which they are to fruit—exposing them during their growth to the greatest possible amount of light you can give them, taking especial care to have the wood perfectly ripe, and inducing an early state of repose. But if the above mode of obtaining fruiting Vines for one year should be thought too troublesome, from the plants requiring bottom-heat during their first stage, the eyes may be planted singly, as before, in 48-pots, and set in any house or pit where there is a little heat; they will be longer, however, by this method in developing their roots, and may not want shifting into larger pots before May or June. When the plants may be shifted into 24s, in which they may remain through the season, in any house or pit in which room can be found for them, paying attention to watering, tying up, &c. They may be stopped when 2 or 3 feet high, and when the wood is fully ripened.

removed out of the house and plunged in any material out of doors that is a non-conductor of heat. In February or March cut these plants down to two or three eyes, shake them entirely out of their pots, and place them in similar sized pots to fruit in as the former ones, taking care to spread their roots (in potting) regularly through the soil, that when growth commences, each spongelet may be in immediate contact with food; this is a much better practice than placing them in a pot without disturbing the ball, as is often done. The same routine of management must be followed with these through the season, as recommended for the others. From the larger amount of organisable matter the Vine possesses by this mode of treatment, they will generally be found stronger than those raised the same year, and they possess the advantage of ripening their wood earlier in the summer. It will depend on the means the cultivator has at his disposal which plan he follows.—*John Spencer, Gardens, Bowood.*

Home Correspondence.

Grafting Pelargoniums.—In a late Number is an account of M. de Méline, of the Botanic Garden at Dijon, having grafted numerous varieties of Pelargonium on the same plant. There are very few plants that can be grafted with greater success than Pelargoniums, if the stock and scion be selected about the same diameter, and if the wood is neither too old nor too young and succulent. For the last ten years I have occasionally grafted some in August or September, using pretty well ripened wood of the same year's growth. I shall only detail one instance:—In August of 1842, I selected a plant of the Beauty of Ware, which had a single stem about a foot high, where it divided into several branches; these were cut back to about three inches long, and in ten days afterwards they were grafted with eight different sorts. They were done after the manner of whip-grafting, and tied with bast and clayed, over which was put a little moss, to keep the clay from cracking, and to preserve the whole in a moist state, being occasionally sprinkled with water. The plant was placed in a shadowy part of a vinery, and in a month every one of the grafts had begun to grow. The plant was then put into a cold frame for a few days; it was then taken out of the pot, and all the earth being shaken from the roots, it was repotted in fresh soil, and received the same treatment as the other Pelargoniums. Two of the grafts were broken off by an accident, the other six flowered well in June and July. In August the branches were again cut back, and ten more varieties were grafted on it, including Smith's Superb Scarlet, Carnation Scarlet, Frogmore Scarlet, and the old variegated-leaved Scarlet; the last two failed along with two of the other sorts. This, perhaps, was owing to the plant having been placed in a shady place out of doors, immediately after it was grafted, where it remained until October, when it was placed in the conservatory. In December there were 13 varieties growing on the same plant, which will be a novelty when in flower, having so many distinct colours, Smith's Superb Scarlet forming the centre. I have observed that weak growing sorts grow stronger when grafted on robust kinds than on their own roots.—*James Alexander, Heath Farm, Athy.*

Gold Fish.—In this neighbourhood, every pond that holds water through the year is full of them, and instead of complaints of failure in rearing them, the great difficulty is to get rid of them. In every cottager's garden, where there is a dip-hole dug to the depth of four, five, or seven feet, there the fishes thrive and breed. In these ponds there is nothing but hanging grass and stones imbedded in clay or gravel to which the fish can attach their spawn, and yet they breed. My own pond, which is perfectly alive with Gold and Silver Fish, is about eight feet deep in the centre; it is made with chalk rammed, and has never had plants of any description put into it, yet waterweeds of various kinds grow in it in the spring and early summer, and then sink down; it is a pond for the cattle to drink at. At the drinking-places rough gravel and stones have been put down to prevent the cattle from poaching or breaking the ground upon any of the chalk; about 14 or 15 years ago it was mudded, and only a few stones returned to it. Several other ponds near me, by the road-side, used as drinking places for cattle, are full of Gold and Silver Fish; nothing is ever done to them by way of nurturing the spawn; the pond in the centre of Epsom is also full. These ponds are all mudded every three or four years, and the fish taken out and sold or thrown away, except a few that are kept in tubs until the rain falls in sufficient quantity to allow them to be returned. On Epsom Common are several large gravel-pits full of fish. I would here observe, that none of these ponds are supplied by perennial springs; the water in them is either rain water, or water from land springs in the winter, or from both these sources. Gold and Silver Fish will not live any length of time in ponds in which there are springs, much less breed in them—the water is too cold; they fur with a kind of moss and die. The ponds I have mentioned have all of them stony or gravelly bottoms, and slope from the sides to the centre; the fish deposit the spawn on the pebbles or gravel in the shallow water, which being much warmer, from the greater power of the sun over it than the deep places required for aquatic plants, the spawn is more certain of being quickened into life. All who form ponds to keep fish in, contrive to have gravel or pebbles at the bottom, in the shallows, because this is the most sure method of succeeding. Another pond that I am acquainted with was made with clay, a little lime being mixed with it; it is full of large fish, but the sides being perpendicular, the fish do not breed well; its depth is three or four feet, and sticks are put in, to which the fish may attach their spawn; this pond is fed from another, where the fish breed abundantly, but it has plenty of stones as well as water-plants in it. The water feeding all these ponds is at times of a brackish nature; it runs over a soil impregnated with iron. I will describe four more ponds in which fish thrive and partly breed. The 1st and 2d are at Epsom, and are artificial; No 1 is made with tiles and cement, about two feet deep throughout, except near the edge, which shelves a little, and is supplied with water from a well in the chalk; when the water in the pond is getting low, a man pumps from the well into the pond. No. 2 is a small reservoir, about seven feet in diameter, and five deep; this, too, is supplied with water from a well in the chalk; the pond is cemented all round, the only places to which the fish may attach their spawn is the sides, and a small fountain in the centre; but in a pond like this it is advisable to put in a few branches of Willow to reach from the bottom to the top. No. 3 is formed like No. 2, only it is deeper by a foot or two, and is supplied with water from the New River; pieces of Willow and aquatic plants are put into it, and during the time I knew it the fish flourished. No. 4 was on the summit of the Gog-Magog Hills near Cambridge; it was a small basin, formed for the reception of the fish, and water was supplied to it from a well in the chalk; it was about a twelvemonth after I had sent fish to it that I saw them, when they appeared to be in good health, but had not then increased; the basin was too small, and too much shaded by trees to favour propagation. If any one is desirous to see fish and ponds, let them visit Epsom about the latter part of May and beginning of June; they will then see how ponds are constructed, and how the fish deposit their spawn, and any little boy on the common will catch them for sixpence per pair. If fish do not breed, the fault is either that they are all of one sex, or that the pond rests on a spring, and is too cold, or is not sufficiently shallow towards the edge; or there is a want of gravel, stones, or sticks in water sufficiently warm during the breeding season.—*J. Steele, Epsom.*

Morphology.—The structure and conformation of the vegetable world is a most interesting and curious study, and well deserves the attention of the botanist. The reduction of all the various organs and developments of plants to a few simple original forms, of which they are but modifications and degrees, has been effected by modern science, and has no doubt thrown great light on the subject. I would, however, beg leave to say a few words on what may be called the abuse of the doctrines taught by Morphology, or the utilitarian way (if I may be allowed the expression,) in which, by this method of explaining structural botany, the majesty of Nature is apt to be lost sight of, and some of her most beautiful productions attributed to mere chance. In the now generally received opinion, the leaf is thought to be the primary form of vegetable organisation, and all the other organs and parts of the plant (with the exception of the stem which produces the leaf) to be but leaves in a more or less developed state. But some writers on the subject go even further than this, and say (if not in precise words, at least by implication) that it is only by chance and casualty that any other organs than leaves and stem exist; that bracts, for instance, are merely immature leaves, which poverty of soil, or other causes, have prevented the plant from developing; or that flowers have been produced from leaves, merely by circumstances favouring their greater development. Now these assertions appear to me erroneous, and I think are at once disproved by the fact of the constant and unvarying arrangement of the different parts of plants by the hand of Nature. In the normal or wild state of any plant, we always find the various organs similarly disposed, and bearing the same relative position to each other. We find the leaf, the bract, and the flower, each occupying its allotted and certain situation. This would not assuredly be the case if their development was but the result of accident. I will admit that the structure of the leaf, the bract, and the flower, is essentially the same (and this seems to be now quite ascertained), but I would have things called by their right names, and I would deprecate the use of language calculated to derogate from the dignity and plastic power of Nature.—*Dendrophilus.* [Our correspondent evidently misunderstands the meaning of the Morphologists.]

The Penny Postage.—The facility, punctuality, and moderate charge at which letters and small parcels may now be conveyed from one part to another, even to the most remote village, hamlet, or peasant's cottage, must alike be beneficially felt by all; and in time will, I make no doubt, greatly improve and increase knowledge, the great bulwark of the country, by stimulating many to attempt writing that under the old system could not afford to pay the postage. Many a poor parent and distant child can now have the pleasure of corresponding with each other; merchants, tradesmen, publishers, and correspondents of all classes are alike benefited by the present reasonable and expeditious transit. To no profession has it opened up a wider field than to gardeners: it gives the opportunity of exchanging seeds with each other from different localities, comparing specimens, and getting them properly named, &c. They can also forward to each other any improved method they may have discovered in cultivating any kind of plant, fruit, &c.; and they can communicate their experience to some periodical, for the benefit of the public, who, if they think proper, may practise and improve on it; for it is to be observed that there is no method or system in practice, however perfect to appearance, that may not be improved upon, by the persevering and intelligent. At the same time I would observe, that a person that takes the opportunity of writing a practical article, which he considers likely to throw more light on the cultivation of any plant, fruit, &c., that he has himself been more successful in cultivating, or in bringing to a higher state of perfection than others, and attaches his name to the article, is certain to receive a host of letters; some wishing for a farther explanation, others observing that it is so different to what they have ever seen or heard of in practice, that they consider it is an impossibility to succeed, &c. Some again write for the whole article, as they have been informed that it has been published in some periodical or journal to which they are not subscribers. Nine out of ten of those worthy correspondents never think of inclosing so much as the penny postage stamp for the required information; thus it is not only an encroachment on a gardener's very limited time, but on his pocket likewise, if he should think proper to find paper, wafers, and stamps. To the correctness of this statement I have not the least doubt many can bear testimony, and like myself are deterred from adding their names, which is very essential to any practical article, in order to give it respect and confidence. Gardeners in general are not so well paid as to afford to answer a host of such correspondents, supposing they could allow their time to be encroached on by writing over again, what possibly cost them many years' anxiety, and ill-paid perseverance to obtain.—*Observer J.*

Double White Hepatica.—In a late Number it is stated that you are unacquainted with any Double White Hepatica. Being misled by Martyn's edition of the "Gardeners' Dictionary," I, for several years, endeavoured in vain to procure a specimen of it. I have, however, the certain evidence of a friend, that a pot of the double white, some years ago, was exhibited at a flower-shop in Bath, which the owner refused to sell for any money, alleging that he had never seen another; and in answer to some subsequent applications for a specimen, the gardener said that the plants had died without his being able to increase it. In Martyn's edition, above referred to, the double white is represented to be equally common with the double blue and double red Hepatica, and the error is continued in Rees' Cyclopædia; but no such mention of the double white variety is made in either of the original editions of the dictionary, and the following interesting suggestion of Miller's has been entirely omitted by Martyn:—"I have sometimes known the double blue sort produce some flowers in autumn, which were inclining to white, and thereby some people have been deceived, who have procured the roots at that season and planted them in their gardens; but the spring following their flowers were blue as before, and this is what frequently happens when the autumn is so mild as to cause them to flower; but whether the double white sort, mentioned in the books, was only this accidental alteration in the colour of the flower I cannot say, though it seems very probable it was, since I never could hear of any person who ever saw the double, white sort flower in the spring."—*L. W. D., Sketty-Hall.*

Celery.—I am induced to recommend a mode of cultivating this valuable esculent, which I practised last season with the most complete success. My gardener having mentioned that his supply of Celery-plants had run short of the expected demand on him, I told him to go to a marsh in his neighbourhood, on the banks of the river Lee, where the tide flows over at high water, and that he would find abundance of plants ready for his use, both of the red and white kinds, and to make trial of them. He looked astonished at my proposal, but seeing that I was in earnest and willing to take on myself the responsibility in the event of failure, he did as he was directed, and is now ready to confess that he never cultivated a better crop than the product of these wild plants, as he called them. Persons who eat of them at my table praised them not only for delicacy of flavour, but for freedom from hollowness in the heart, which was found in almost all the Celery of the past year in this quarter. My gardener is so well satisfied of the result of the experiment, that he does not intend sowing Celery-seed in a hot-bed as usual this season. It will be said in reply, such are not within the reach of many to procure; but where they are I can confidently recommend them. *En passant*, I may remark—"I do not consider the rearing of large Celery desirable," as Mr. Paxton and others observe.—*Corcagiensis.*

Seedlings.—I have noticed that young plants in the seed-leaf, if deprived of their root and replanted, plunging them up to the cotyledons, and pressing the earth, which must be very fine, carefully up to the tender stem, will again strike root and flourish. This may be useful in the case of valuable plants, one only germinating perhaps out of the lot, and that damping or having been eaten off by insects close to the surface of the earth. It was first noticed in the case of a Balsam, afterwards with Anagallis and others. The fact may not be new, but is, at all events, worth knowing at this time of the year.—*Micklewell.*

Linnæan Botany.—On page 361 of the "Gardeners' Chronicle" for 1843, it is stated in a notice to a Correspondent that "The Linnæan system of Botany is not worth learning, and we cannot do you the disservice of recommending you a book on the subject." Now, if by this is to be understood, that a knowledge of the Linnæan system does not tend to explain the physiological structure of plants, to ascertain their medicinal properties, to assist the investigation of the laws of vegetation, to enable Botanists to declare the general nature of the soil on which plants are discovered; that, lastly, it does not allow the application of Botanical science to the purposes of Agriculture, the truth of the above statement is easily admitted. But if, on the other hand, we are to believe that Linnæus's system is abstractly bad, that the knowledge conveyed by it is not worth retaining in the memory, or that it positively misleads its followers, such a statement appears to be open to considerable objection. Superior as a natural system must always be to an artificial,

it still must be admitted that, considering the limited number of Phænogamous plants natives of Great Britain (for the natural orders of the Cryptogamic division are comparatively few, and generally known at sight) a person in this country who had not recourse to large collections, would scarcely be able to form any idea of a system guided and established by the principles of nature; the materials with which he has to work are too scanty, and allow not of a comprehensive comparison. There is nothing in the Linnæan system which is essentially incorrect; the knowledge gained from it is imperfect and unsatisfactory only. In the description of any natural order we are generally told the number of stamens and pistils; so that the number of these organs, even in a natural system, form two distinguishing characteristics of any given order. It would be well for any one, when studying an artificial system, to remember that this is not the Science of Botany, but merely an easy mode of discovering the name, and name only of the plants found in the particular place or country in which he might happen to be. And there seems to be no objection, in this sense, to the admission of the value of such a system. The pupil would consider that he was only reading the contents of, or introduction to a portion of a large volume, which he afterwards intended to study philosophically and in detail. There is no wish whatever to set up the old against the new system; at the same time it should be borne in mind that no new method is advanced by the depreciation of its predecessor. In a word, there seems to be no practical advantage in dissuading those from following an artificial, whose occupation and inclination would preclude the more laborious studies of a natural system.—*F.* [Our answer is, that Linnæan Botany teaches nothing but names, and them with less certainty and advantage than the natural system. It had its use in former days, but is now abandoned by all Botanists.]

Season for Shifting Plants.—Respecting the autumn-shifting of plants, "J. W. K.," at p. 102, says that "plants are in the habit of appropriating nutritious matter by their roots during the season of rest;" or, in other words, that their roots continue to grow while the head remains dormant. I have lately had an opportunity of testing the truth of this opinion. Having received a quantity of Pelargoniums from a nurseryman about the end of last November, and thinking the pots they occupied rather small, I immediately shifted them into pots two sizes larger; having been kept very cool, they have grown little. I examined them very lately, and I find in most instances, where few additional leaves have been formed, scarcely a single fibre has reached the outside of the ball (and yet the plants are perfectly healthy). I cannot comprehend how the formation of roots can take place, to any extent, without a corresponding development of leaves; we do, indeed, see in bulbs a disposition to form roots without any extension above ground; but this is contrary to what "J. W. K." assumes to be the case, which is, when plants are at rest, whereas this is when the bulbs are concentrating all their energies in order to produce leaves. I am decidedly of opinion that excepting where the one-shift system is pursued, no better plan can be adopted in the cultivation of greenhouse plants, than that of allowing them to fill their pots with roots by the end of October, and shifting them again about the middle of February, when the growing season commences.—*E. J.*

Yeast or Leaven.—The following recipe is known to make good light bread:—To 2 oz. of Hops put 8 quarts of water, simmer it four hours, until reduced to 6 quarts; thicken it with 2 lbs. of Wheat-flour, and stir into it two table-spoonfuls of moist sugar. Let it remain in an earthen pan until lukewarm, then add a tea-cupful of good fresh beer-yeast, and bottle it in wine quarts; each bottle must not be more than half-full, and two such bottles will leaven 13 lbs. or 14 lbs. of flour. It must be thoroughly well corked. The beer-yeast is required only for the first making. The second time it is made, a tea-cupful of the old leaven should be substituted for the beer-yeast.—*K. O.*

Pruning Trees.—It is most extraordinary that the mode suggested in the *Chronicle* of pruning trees has not been generally adopted, since it appears that in the principality of Wales it has been practised 40 years with the happiest result. It recommends itself by its extreme simplicity, and by its accordance with plain, practical common-sense; and yet what (comparatively) little progress has it made amongst men who have an opportunity of seeing the advantages of the system at a trifling expense! But "they have eyes and see not." What number of acres does it require to make a wise-acre? About two years ago I got the ear of the bailiff of a gentleman who planted 12 acres when the common was inclosed. The trees required the knife; the bailiff saw the advantages of this method, and promised to set about it. That he might not be plagued by the ignorance or the obstinacy of the labourers, I took him a man who understood it, and was willing to undertake it almost without pay; for he had the sense to see that it would bring him into notice, and benefit him extremely. Notwithstanding all that had passed, the work was never begun, because the owner objected that the experiment should be made, and the plantation will be treated as all others in the neighbourhood have been, *i.e.*, neglected and spoiled!!—*A Fenman, Isle of Ely.*

Covering for Greenhouses.—A correspondent in the *Chronicle* recommends the use of prepared linen as a substitute for glass in frames, pits, and greenhouses. Plants require a pure light, and will not grow so luxuriantly if it is conveyed through a dense medium; if the top of a conservatory was covered permanently with anything to exclude the direct rays of light, the plants would be found to incline to the glass sides. The plan may answer as a temporary protection from frost, or to shade from the mid-day sun; but it would, in all probability, disappoint the amateur if he solely depended upon it instead of glass.—*Falcon.*

Functional Disease.—In 'the analogies' made use of (p. 148, March 9), to illustrate my argument in favour of the possible existence of functional disorder independent of structural disease, I did not, as "Der Greif" supposes, overlook the difference between animate and inanimate machinery. But in treating of the phenomena of living organism, whether in its normal or abnormal condition, in our ignorance of the essential nature of the living principle, we can only reason of them with reference to the chemical and mechanical principles by which those phenomena are guided. It is the privilege of the living tissue to make these principles subserve its several purposes; but always in obedience to the laws which govern inanimate matter when moved by disturbing causes, whether of chemical or electrical affinities, molecular force, or any other moving power. Or, in other words, the only difference between the living organism and the dead is, that the former carries within itself the originator of its own movements, and to a certain extent the power of repairing its own waste; while the latter derives the same privileges from some extraneous agency. With this difference every animal organ is as much a machine for the performance of some chemical or mechanical action on the materials offered to it, as the merest engine of the factory or laboratory, and for such purposes is guided by the same laws. Premising thus much on "Der Greif's" objection to my mechanical analogy, I go on to observe that he does not seem to recognise the distinction which certainly exists in Nature between change of condition and change of structure. If it be maintained simply that disease arises from altered condition of an organ, then I concede the point, and there is an end of the matter. No one supposes that functional disorder can exist without altered action—abnormal motion. An organ may be over or undercharged with blood, may be over or underdone with nervous power or nervous electricity; there may be in it too much or too little combustion, for the healthful performance of its function, and yet its structure be unaltered. Just as a mill may be over or underdone with grist or with water, and stop, though all its wheels and cogs are in right order. There is still another and a better reason why functional and structural disease should exist independently. Every part of the animal organism is endowed with a double apparatus, or system of parts, the one subservient to its functional, the other to its material existence. There is not anything done in the animal economy that is not done by its peculiar instrument. The functions of an organ are maintained by nerves and blood-vessels, which administer nothing to the nutrition of that organ. Its powers are maintained, its waste supplied, its worn-out materials removed, by nerves, blood-vessels, and absorbents, distinct from and independent of the influences that determine function. The material existence of an organ may be maintained in perfect sanity; its supply and waste may go on, for a time at least, in perfect harmony, by means of the blood-vessels and nerves appropriated to its structure, whilst its functions may be increased beyond the ordinary rate, or altogether suspended. Every physiologist knows that the nerves of secretion in a viscus may be destroyed, and its functions lost, and yet that organ does not die, nor waste away, till long inaction has made it useless; and perhaps not then. Structural change, or organic disease, then, must be the work of the structural system. It may co-exist with functional disorder, and it cannot exist long without inducing it—for a faulty instrument must work badly. It may be induced by functional disorder, because inordinate or irritative action disturbs the healthy equilibrium of supply and waste—as an overworked engine soon gets out of repair. In fine, functional disorder may be of long or short duration,—it may come and go in a moment, because it is not structural. But organic disease cannot be established till some disturbance takes place in the nutritive apparatus appropriated to its maintenance, nor removed till the consequences of that disturbance are corrected.—*M. D.* [We trust our valued correspondents will agree with us, that it is better not to prolong this discussion, which may become inconveniently long.]

Hops.—It is my belief that Hops are absolutely necessary for the preservation of beer, but not at all essential for yeast. The flavour is dependent on an aromatic essential oil, which is dissipated by boiling, though the bitter extractive is obtained in solution. An infusion, however, will extract the aroma without much bitter principle. Now, a decoction of Hops will not keep long, any more than a decoction of Malt, but they contain very opposite constituents. Hops contain tannin, extractive bitter principle, wax, resin, and lignin; whereas Malt contains resin, gum, sugar, gluten, starch, and hordein. The antiseptic properties of the Hop, therefore, are evident, and, no doubt, after vinous fermentation of the two decoctions, a combination of constituents (notwithstanding the sugar, &c. of the Malt being converted into spirit) takes place, and the result is a liquid, which will keep for almost any length of time, if preserved from the action of the atmosphere. It is evident, from the common practice of brewers adding the Hops previous to fermenting the wort, that they do not prevent, nor even retard vinous, but undoubtedly they retard acetous fermentation; therefore yeast may be made with or without Hops.—*J. B. N.*

Rabbits.—I am possessed of a property, consisting of underwoods, arable pasture, and garden ground, adjoining to a gentleman who has large landed property, particularly 200 or 300 acres of underwood; and in which, both to my annoyance and injury, he suffers the breeding of rabbits to such an extent as to destroy acres of corn and grass of his neighbours, and he is deaf to entreaties to destroy them. As for myself and tenant we do all in our power to destroy them on our own premises; and he has suffered his keeper to take advantage of my tenant trespassing only about 20 yards out of my road to a bush in his hedge to shoot the vermin in my field at my desire, by laying an information through the Surveyor of Taxes, and fining him in the double penalty for carrying a gun. Can any of your correspondents assist me with advice how to destroy these rabbits? Traps, wires, guns, and dogs have been used to get them out of my premises, but I cannot devise means to keep them off. It would take a mile in length of netting to fence out, and net has been used round my garden, but they have eaten a thousand holes.—* [A good answer to this would doubtless be useful to others as well as to our unfortunate correspondent.]

Miscellaneous.—*A. H.* states that in Essex the Prunus cerasifera, commonly called the Myrobalan, or Cherry Plum, which bears so freely as a standard, is found valuable for the sake of the young fruit, which is used for tarts like green Apricots, and with about equal gratification to the palate.——*E. L.*, a known correspondent, informs us that he could have cut six fruit, averaging 15 inches long, from one plant of the Browston Stock Cucumber on the 21st of March; each fruit was from 14½ to 16 inches in length, making 90 inches of Cucumber from one plant in one day. He states that they were all good table fruit. The same writer says that from the same plant he lately cut four handsome fruit and a curious double one which, if considered as two, make six. The plant that produced these we understand is growing in a pit that was contrived by Mr. Mills, of Gunnersbury Park. It is worthy of remark that this same plant produced one of the fruit that won the first prize at Ipswich on the 8th of February, and it is still in full vigour. A fine specimen of the Browston hybrid, and also the double fruit, were sent to Covent Garden market, where they have been seen by many gardeners, who all consider them equal to any they have yet seen in the market this season.

Societies.

HORTICULTURAL SOCIETY.

April 2.—R. H. SOLLY, Esq., in the chair. A. Pryor, Esq., was elected a Fellow.—Mr. Hunt Grubbe, of Shirley, near Southampton, sent a specimen of slate wall contrived by him, which was stated to have the following recommendations. If placed direct with the meridian, and thus made to have an equal share of sun on both sides, it will ripen any fruit on either side earlier than the south side of a brick wall by means of the transmitted heat. It is not recommended as an outside fence, as it is liable to be broken; but chiefly for intersecting the interior of gardens in the place of dwarf or shelter hedges. It consists of squares of slate grooved into each other, and strengthened by piers or pillars, which are placed at certain distances—and, being built with circular and square bricks cemented together, are round and stand out a little from the wall. The trees are fastened to wires, which are fixed into the slate about six inches apart. Mr. Grubbe stated that this wall could be erected for 5½*d.* the square foot, being 1*d.* less than even a 4½-inch brick wall, which costs 6¼*d.* the square foot.—From the gardens at Chatsworth were two bunches of West St. Peter's Grape, shrivelled, and in the condition of fine raisins, which Mr. Paxton stated to be of last year's growth, and to have been kept through winter at an almost nominal expense of fuel. The house they have been kept in was in a low situation, and therefore not well suited for late Grapes. Mr. Paxton considers it a better Grape than the Black Hamburgh; and if both have the same treatment, the St. Peter's will keep six weeks or two months longer than the Hamburgh. Along with these were also the following plants:—Dendrobium Paxtonii, a large specimen, with orange blossoms, having a black spot in the centre; also Eria excavata, cut specimens of Dendrobium Wallichii, D. cærulescens, and Cœlogyne interrupta, the latter with pretty white and yellow flowers. A Knightian medal was awarded for the Dendrobium Paxtonii.—Messrs. Loddiges, of Hackney, sent Dendrobium macrophyllum in good condition,—this rare species is remarkable for the strong aromatic fragrance of its fine lilac blossoms. A Knightian medal was awarded for it.—From Mr. Green, gr. to Sir E. Antrobus, Bart., was a most beautiful large specimen of Erica aristata major, uniformly covered down to the pot on all sides with pretty carmine and white waxy blossoms; it was also feathered with healthy dark-green leaves to the very extremities of the branches. Along with it was a seedling Calceolaria (called zebrina), the flowers of which were of a bright yellow, beautifully spotted with brown; Amaryllis hybrida, and Boronia anemonefolia, the latter with pretty rose-coloured flowers. A Banksian medal was awarded for the Erica.—Mr. Jackson, of Kingston, sent Tremandra Hugelii, a greenhouse plant, with drooping star-like lilac blossoms, having a small dark spot in the centre.—From Mr. Fielder, gr. to W. Linwood, Esq., was a cut specimen of Phycella chloracra, a bulb sent by Mr. Hartweg from rocks near Saragura; the flower-stem that bore the handsome but not gaudy green, red, and yellow blossoms sent was said to have been 3 ft. 2 ins. high.—Mr. Robertson, gr. to Mrs. Lawrence, sent a collection of plants containing Cyrtopodium Andersonii, rarely seen in such perfection; an enormous specimen of Maxillaria Harrisonii in wonderful health; Brassia Wrayæ, a species from Guatemala; Oncidium ampliatum major; O. luridum; a Hippeastrum, and a well-grown plant of Erica Willmoreana. A Knightian Medal was awarded for the three first.—From Messrs. Henderson, of Pine-apple Place, was Odontoglossum Rossii, sent from Belgium under the name

of Oncidium Bergamia. From the same collection were Dillwynia tenuifolia, a scarce New Holland shrub, which has a gracefully drooping habit, and is a remarkably free bloomer; Brachysema platyptera; Epidendrum aloefolium; Boronia anemonefolia, and Dendrobium cærulescens covered with blossom. A certificate was awarded for the Dillwynia and Brachysema.—Mr. Ivery, of Peckham, exhibited seven seedling Cinerarias, and a plant of the new Nemophila discoidalis.—From Mr. Lee, gr. to P. Pole, Esq., was a Cucumber which measured 21½ inches long.—From the garden of the Society were the following plants:—Acacia hispidissima, Boronia anemonefolia, Begonia papillosa, B. acida, Columnea Schiedeana, the larger variety of Oncidium ampliatum, Acanthophippium bicolor, with curious yellow cupped blossoms, and Echeveria rosea, a greenhouse plant remarkable for its bright red leaves that are more conspicuous than the flowers, which are of the same colour. It was sent to the Society by Mr. Hartweg, from Mexico. It is not impatient of cold, having been sometimes exposed to a temperature as low as 35°; it will also, on the contrary, stand any amount of sun-light, and it keeps in bloom during the whole winter, so that it is a very useful plant for many purposes. With these was a flower of Aristolochia Gigas or "Pilate's nightcap;" a twining stove plant, which bears singular large concave blossoms having considerable resemblance to those of A. fœtens, but much larger, and assuming more the appearance of a cap.

Reviews.

Geology; Introductory, Descriptive, and Practical. By D. T. Ansted, M.A. 8vo. Van Voorst, London.

As far as we can judge from a single Number of 128 pages, this promises to be a useful work for the Geological student. The language is clear and simple, and the illustrations selected with judgment.

In describing the various conditions through which the crust of the earth has successively passed, the Author commences with the rocks in which the Geologist discovers the remains of extinct animals or plants, and he proposes to notice such formations in the order of their stratification,—that is to say of their antiquity,—deferring to a future part of his work the examination of those most ancient rocks which preceded the appearance of living things, and from the destruction of which the later rocks proceeded. We cannot at present judge how far this plan will prove judicious; at first sight it is open to obvious objections.

There is one point, however, in which Mr. Ansted seems clearly to have committed an oversight. At his 54th page he adverts to the importance of the statement that "fossils are characteristic of formations," an assertion which supposes "a degree of perfection in the application of Zoology and Botany to such fragmentary portions of structure, that the reader may fairly require some account of the successive steps by which the result was at length reached, and a connected view of the nature of the argument that has led to conclusions which, however viewed, are so exceedingly remarkable." And then he proceeds to give that account. But after sketching the nature of this kind of investigation in Zoology, he passes over the equally important and more difficult inquiry of the Botanist, with a short assurance that he will have some observations hereafter to make upon that subject. This is to us, we confess, a puzzle; if it was necessary to introduce at an early period of the work, a sketch of Fossil Zoology, it was equally important with respect to Fossil Botany, for plants and animals were coeval. This may to some appear like cavilling; but we have been too long students of Nature not to feel the paramount importance of good arrangements, and the excessive inconvenience of want of method; and we should be sorry to see so popular a work as that of Mr. Ansted promises to become, impaired in usefulness by inattention to such points.

We must not dismiss the Part before us without a word of praise to the printer and wood-engraver, who have each combined to render Mr. Ansted's work worthy of a place by the side of Yarrell's "Fishes." Nor should we omit a specimen of the Author's mode of treating his subject. For this purpose we select the following passage:—"I may safely conclude these introductory chapters by assuring the reader that, with regard to the various discoveries of Palæontology, they all speak the same language, and all support the same argument; namely, that, in the order of succession of those species of animals or vegetables which have preceded man upon the earth, as well as in the composition of the various strata in which they are found entombed, there may be traced, throughout, an unity of principle, acting by an infinite variety of means: and one system, perfectly symmetrical and beautiful, and adapted to every emergency, has been invariably pursued from the first creation of organised beings till now. From that far distant period when the inhabitants of the earth consisted only of the coral animalcule and the mollusc, throughout the gradual introduction of animals of higher organisation, until the day when man was created, and endowed with an intellect capable of comprehending and appreciating the infinite wisdom displayed in the great plan of creation, that plan has been the same; gradually unfolding itself until fully developed in all its extent and *perfection*."

NOTICES of NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

QUISQUALIS SINENSIS. Chinese Quisqualis. (*Stove Climber*). Combretaceæ. Decandria Monogynia.—This plant was exhibited before the Horticultural Society in July, 1841, by Messrs. Lucombe, Pince, and Co., of Exeter; who stated that it is a more compact grower than the old Q. indica, and therefore more desirable for cultivation in pots. It manifestly differs in its smoother leaves and branches, and in the larger size of its flowers, which are, moreover, of a much deeper Rose-colour. Upon comparing it with wild specimens of the genus, it appears to be identical with the plant that is found about Canton, and which is probably the Q. indica of Loureiro. We presume it to be of the same nature as the true Quisqualis indica. That plant is a stove climber, requiring to be potted in sandy loam and peat, mixed with a few pieces of potsherds. In summer an ample supply of water should be given to its roots, and it should be syringed over head once or twice a day, as the weather permits, taking care always to have the plant dry before night; and the house, when air is given, shut up early in the afternoon, to retain as much sun heat as possible. During the growing season the temperature should average 80° by day, and 68° by night; but in winter it should never rise above 60° with fire heat. The plant may be propagated by cuttings under ordinary treatment.—*Botanical Register*.

BOLBOPHYLLUM MACRANTHUM.—Large-flowered Bolbophyllum.—(*Stove Epiphyte.*)—Orchidaceæ.—Gynandria Monandria.—This singular plant was imported by Messrs. Loddiges from Sincapore, and is closely allied to both B. leopardinum and affine. From each it differs in its much more fleshy and larger flowers, whose stalk is considerably longer than the petiole. The flowers appear in March, and expand so flat that they seem as if they had been pressed between paper. In the centre they are a pale lemon colour, but towards the tips they are much mottled with dark chocolate-coloured spots. Like the rest of the genus, it succeeds best when tied to a block of wood, and suspended to a rafter in a moist stove. If the wood is charred enough to burn off the bark, the block will be found to answer the purpose much better, and all insects that harbour about it will be destroyed. In summer the plant should receive water twice a-day at least, and the temperature should be kept about 80° by day, and 68° at night. In winter for a few weeks very little water will be required, only as much as to keep the pseudo-bulbs from shrivelling. The temperature then should never be raised above 50° or 55° with fire-heat.—*Botanical Register*.

Miscellaneous.

Botanical News.—We learn with great pleasure that Mr. Harvey has been appointed Curator of the Herbarium of Trinity College, Dublin; and that he is about to make public the valuable Californian and Mexican plants of the late Dr. Coulter, which are preserved there. Dr. George James Allman has been elected Professor of Botany in the same College. We are also able to state that Government has given the sum of one thousand pounds towards defraying the expenses of publishing the Botanical collections made by Dr. Joseph Hooker in the late Antarctic voyage, and that the work will soon appear in quarto. The drawings which we have seen are really beautiful.

Artificial Fertilisation.—The attention of every friend of Horticultural science ought to be directed to a very interesting fact, which I have recently had an opportunity of observing in the course of a Horticultural tour in Belgium. In the climate of Paris, it is known that only a small number of species and varieties of the Camellia perfect their seeds. Those which commonly do so are the C. carnea, and a few species with semi-double flowers. I have thought, with other Horticulturists, that the difficulty in obtaining ripe fruit from the Camellia was attributable to the low temperature of the climate of Paris; and I was, moreover, inclined to entertain this opinion, from observing that the greater part of new varieties were from seeds ripened in Italy and sown in France. I was then very much astonished at seeing in Belgium all kinds of Camellias, almost of all ages, some only three years from the graft, bending under the weight of fruit with which they were loaded, as a Paradise Apple-tree is loaded with Apples in a favourable season. I formed the idea that this was to be attributed to artificial fertilisation; and in this I was confirmed by the following details, with which I have been favoured through the kindness of M. Haquin, a distinguished Horticulturist, at Liége. During three years in which M. Haquin has practised artificial fertilisation, he has only collected seeds of single-flowered Camellias, and preferred sowing but a few of the best seed. In the first season, out of 212 seeds, 146 grew; and, in the second, 188 plants were obtained from 294 seeds. In the present season the number of fruits on the following varieties is as under:—

Camellia carnea	. . .	3	Plants	96	Fruits
,,	Donkelaerii . .	2	,,	18	,,
,,	King . . .	1	,,	3	,,
,,	Press's eclipse .	1	,,	4	,,
,,	Lady Henrietta .	1	,,	1	,,
,,	marmorata . .	1	,,	9	,,
,,	punctata . . .	1	,,	1	,,
,,	Campbellii . .	1	,,	2	,,
,,	Waratah . . .	1	,,	11	,,
,,	Cliviana . . .	1	,,	1	,,
,,	variegata striata .	1	,,	6	,,
,,	Loddiges' conspicua	1	,,	2	,,
,,	picturata . .	1	,,	1	,,
,,	nobilissima . .	1	,,	3	,,
,,	Weimarii . .	2	,,	10	,,
		19		168	

The fruit of the Camellia generally contains 7 or 8 seeds, and occasionally as many as 10. M. Haquin may, therefore, estimate his saving of this year at not less than 672 seeds, reckoning at the rate of 4 seeds in each fruit; this result promises for the ensuing year an important addition to a collection already rich in young plants. It is certain that the greater part of these Camellias would not have fruited, if their blossoms had not been artificially fertilized. The mode by which M. Haquin has effected hybridization is truly interesting. Many Azaleas have been fertilized with pollen kept for 6 weeks; that of Camellias has been employed successfully after having been kept 65 days. Fertile seeds of Lilies have been obtained from the application of pollen which had been saved 48 days. During the last flowering season of Camellias, M. Haquin collected pollen with which he intends hybridizing in the ensuing year. The following are some details of his procedure. The stamens are taken out just before their anthers begin to open; they are immediately wrapt in sized paper, and laid in a warm place for 24 hours, by which time the pollen separates from the stamens. It is then collected and inclosed in thin sheet-lead, and kept in a cool, dry place. I think the preservation would be rendered more perfect by placing the pollen between two concave glasses, as is done with vaccine matter. No limits can be assigned to the time during which pollen will retain its fertilizing power, provided the minute globules of which its masses are composed are not crushed by too great pressure. If there be a limit, it will be for experiment to ascertain. I believe the preservation of pollen between glasses is worthy of trial. The subject of the above statements is not new, for artificial fertilization has been long since practised on a large scale. But it is so powerful an agent in the hands of the horticulturist, that nothing which tends to render it more common can be considered unimportant.—*Rogonnot Godefroy*, in the *Revue Horticole, for Sept.* 11, 1843.‖

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

No opportunity should now be lost to pot all plants that require shifting. Plants that have been growing for some weeks, particularly young ones, will now require to be stopped, more or less, in order to make them bushy. Never make use of a stick to give form to a plant that can be managed by pruning or stopping. Many plants will require to be slightly shaded in the middle of the day, but this should be removed early. Use the syringe every day the sun is out strong; be cautious in watering newly potted plants, and guard against insects.

Conservatory.—Roses and all scented flowers that retain their sweetness after drying, should be gathered as they begin to fade, and carefully dried at this early season; these, if placed here and there through the rooms, will be better liked by many persons than fresh flowers. Orange trees require particular attention when they are making their young wood; stop luxuriant shoots at the fourth or fifth joint; no one part of the head should be allowed to grow stronger than the rest; young trees may require some of their stronger branches to be tied down for a time, which will strengthen the others. Forced Rhododendrons and Azaleas are the best from which to obtain hybrids; this is a good season for crossing them. Climbers for this house should soon be planted, if additions are to be made to them this season, and see that the young growths of the old ones do not get entangled for want of training.

Greenhouse.—Plants in this house will require all the air that can be given them, and they will be liable to get very dry on that account; water them late in the afternoon, and damp the paths and all empty spaces freely; give them besides a gentle syringing three or four times a week, when the weather is fine. These plants require constant attention now to stopping and regulating their growth.

Forcing-pits.—As these pits are the last places for spring propagation, and as this work does not admit of large portions of air being given, they must be regularly shaded in hot dry weather—thin bunting or calico should be used for this purpose, mats darken too much. Remove Roses and other plants as soon as their first blooms are ready to open. To get handsome plants of the different hardy shrubs for future forcing, cut down some of them now in the shrubberies; the strong shoots from the stools may be layered in summer, and with a little nursing they will soon make far better plants than older ones.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

Newly planted trees and shrubs will require strict attention in regard to water, as they already indicate the want of it. It is better to give them a thorough soaking at once, than to give them a little water, frequently repeated; and after the surface of the ground is dry, fork or hoe it over, and then mulch with short grass, to prevent the evaporation of moisture. The same remarks apply to newly planted annuals, which must be shaded as well as watered. Turf, which has been recently laid down, requires strict attention. It will be a good plan, after giving it a good soaking of water, to dress it over with old tan, or leaf-mould, and then shade it by covering the ground with pea-sticks, or any refuse branches that may be laying about. Get in a successional crop of Sweet Peas, and any other Annuals that were sown early in the year. Sow Ten-week Stocks for transplanting. The finer kinds of Gladioluses which have been brought forward in pots, may now be planted out, giving them a deep, rich, and well-drained soil; but it will be as well to protect them by an inverted pot at night, until all danger of frost is over. Attend to covering half-hardy shrubs and trees, or, as the sap is moving, one night's sharp frost, which we are not unlikely to have, will undo all that you have done in the way of acclimatising for years.

Pits and Frames.—Proceed with the potting off all plants for bedding out; those which have become established and hardened may be removed into temporary pits, and covered with mats. Some neat and very convenient permanent structures for protecting plants in small pots, may be seen in the nursery of Mr. Rivers. They consist of pits three feet wide, formed of large paving tiles, placed on edge and cemented together, they may be covered either with shutters, mats, or a large tarpauling to cover five or six ranges. Where flower-gardening is extensively practised, 500 or 600 feet of pits of this kind would be invaluable, and would not be very expensive.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas.—As the consummation of the Florist's hopes—a good and general bloom of this favourite flower—is now rapidly approaching, his constant attention to their various wants, such as shading from the mid day sun, watering, &c. &c., is imperative. As the trusses rise, the plant will sometimes produce two, should there be more hearts than one: in this case it is best to remove the weaker, and with a sharp-pointed pair of small scissors thin out mis-shapen buds from the centre of the truss, leave it so that the best may have room to expand freely and equally. It is highly important just now that the pots should never be allowed to get too dry, though indiscriminate watering must be avoided. *Tulips.*—The late fine weather has brought these flowers on fast, and they are looking unusually well throughout the country; some growers, however, complain of many of their bulbs missing bloom having only put up a single leaf. The beds must be kept free from weeds, and the surface loose. *Polyanthuses.*—These usually flower at the same time as the Auricula, or perhaps rather earlier. Plants on the border must have their trusses shaded with small boards, or other covers, as some of the varieties are apt to have the lace or edging of the flowers "blanched" by too much sun. Plants in flower may be taken up with a ball of soil, and potted, with perfect safety, for exhibition. Snails are very apt to mount the stems, and eat out the thrums, leaving their slimy track as a proof of their delinquency. *Ranunculuses.*—Seedlings may now have plenty of air and morning sun, but never let them get thoroughly "droughted." Frames covered with calico coated with some transparent composition, will doubtless answer admirably for their protection. *Pinks.*—The late dry weather has been anything but congenial to spring-formed beds, and unless shaded, watered, and well attended to, they will suffer materially. *Carnations.*—Potting-out should now proceed rapidly. Well drain the pots, putting a little moss over the broken tiles, cinders, pot, or whatever may be used for this purpose, that the soil may not run in and prevent the free egress of water; fill with compost, and, according to the size of your pots, place one or two layers, giving them a gentle watering, to settle the soil; after which, place them in the shade for a few days.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—Plants swelling their fruit will require to be frequently looked over this fine weather. Give water to those re-

quiring it; but do not give any till they require so much as to wet the soil thoroughly. You will by this course avoid the evil of having the soil soddened; a thing certain to occur to some, if water is given whenever the surface appears dry without examining the state of the soil below; the plants being plunged, the soil in the pots is often sufficiently moist when the surface appears dry. Liquid manure will greatly benefit the plants in fruit, and those for autumn and winter-fruiting, as soon as they are known to be rooting freely.

Vinery.—The utmost attention must be paid to timely thinning the bunches of Grapes, stopping laterals, and tying in the leading shoots, also the spurs or bearing shoots. Give air early on clear mornings, that the leaves of the Vines may be dry before the sun comes full upon the houses. The Tokay and Cannon Hall Vines require shading in very bright sunshine, as the foliage of the former is liable to be scorched, and the fruit of the latter to acquire a scalded appearance: thin bunting would be very suitable for the purpose.

Peach House.—Give plenty of water to trees swelling their fruit. I find that the syringe keeps the trees perfectly clean of aphides; and tobacco water banishes from the trees or destroys the thrips. The late house should now be kept at 50° by night, and have air admitted from 9 in the morning till 5 in the afternoon during mild weather.

Fig-House.—Figs lately commenced growing should have plenty of water. Continue to stop the lateral shoots of trees more advanced, above the second or third leaf. Give plenty of air when the atmosphere is clear and warm, to keep the large and numerous leaves of the Fig in a healthy state.

Melons.—If the Persian Melons, planted out early, have been shaded from the sun, it will be proper to discontinue it by degrees, till dispensed with altogether. Avoid wetting the foliage after the shoots begin to grow freely, and endeavour to induce a firmness of texture in all parts of the plants. When the sun is bright and much air admitted, keep water in the vapour troughs and sprinkle the soil lightly; but in dull weather keep a drier atmosphere.—*G. F.* [In last week's Calendar in Peach-trees, read "stoning" instead of "showing."]

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Strawberries.—In cold exposed situations, plantations made now from plants, pricked out thinly last autumn in a sheltered situation, will succeed better if transplanted with balls, than if the plantation had been made in the autumn. The ground should previously be well trenched and manured, as no spade ought in future to be inserted amongst them, until it is necessary to dig them down. A plantation will stand, and produce plentifully many years, if, after bearing every season, the beds are thinned out, so that those left will have their leaves fully exposed to sun and air. Unless for new kinds, there is no method of making fresh plantations comparable to that of turning out those forced in pots. By this method I prolong the Strawberry season until frosty nights set in, and the same plants produce plentifully the following June.

Turnips and Radishes.—Sow on a warm border. If sown in alternate rows, the Radishes will be pulled out of the way of the Turnips. To have the latter juicy and sweet, sow every fortnight until August. The Snowball is an excellent early variety. Follow with the white Dutch, which is the most general favourite with the *artistes* of the kitchen. *Beans and Peas.*—Earth up and stake if necessary forward crops, and keep sowing successions of the Windsor Beans, and the Marrows and other large Peas. The Victoria Marrow is an excellent Pea, considerably earlier but not so good a bearer as Knight's tall or dwarf Marrow. The new sorts will be sufficiently tested this season. *Kidney Beans.*—Sow a few of the early Negro or Fulmer's Forcing on a warm border; also a number of pots to be placed on a slight hot-bed, to be gradually hardened and turned out when all danger from frost is over. The frames and glasses used for forwarding Cauliflowers, &c., will now be useful for Beans, Tomatoes, Capsicums, Cucumbers, &c. *Routine.*—Stir the soil among all advancing crops, earth up Cabbages, water Cauliflowers. Keep the Dutch hoe in motion during this fine weather, which will not only prove hostile to all springing weeds, but prevent your ground getting dry and cracked from rapid evaporation.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Should now be gone through, to fix upon and mark what Oak-trees, or others required for the bark, should be cut down before the peeling season commences. The same should be done with resinous trees; now is the best time to fell such trees, when the sap begins to flow.

Coppice.—The cutting of poles, cordrods, rods for watling, or other purposes, may now be proceeded with. This is the best season for such work where a vigorous succession crop is required. Birch should be left until it is further advanced, in order to prevent injury from bleeding.

Young Plantations.—All planting for this season, where not previously completed, should be finished as soon as possible. The planting of evergreens is generally recommended to be done in April or May, but I would prefer October and November. All works formerly recommended should be completed as soon as convenient, such as thinning, weeding, hoeing, and fastening newly-planted trees. Training, shortening, and removing some of the strongest and too numerous side branches, may be continued through this and the next month.

Hedge-rows.—Young trees, in old hedges, should be relieved from the encroachment of Thorns, Briars, Hazels, &c.; in order to encourage side branches, they should be trained to one upright leader. Remove the strongest side branches, and shorten some of the moderate-sized ones, to prevent them from getting too large previous to their final removal.

Nursery Work.—Now, that the weather seems settled, this should be a busy time in this department; sow seeds, nuts, kernels, &c.; plant out seedlings and other small plants, but take great care not to allow the small tender fibres to get dry after the plants are taken up; it would be a safe way to have a bucket with a puddle made of cow-dung, mixed with a little loam or clay, to put their roots into before planting, or while the operation is going on.—*W. B.*

VII.—COTTAGER'S CALENDAR.

This spring having been cold and wet, everything is later than usual. In the meantime, during these sunny days, prepare for the main crops of Carrots and Parsnips, so as to get them in when the ground is dry. Both of these like a deep rich soil, and if it is of a light nature, it is the more suitable for their long tapering roots. They should follow a crop for which the ground was previously well manured; for if manure is applied in spring the roots will be forked and wormy wherever they come in contact with it. Parsnips require a greater distance between the rows than Carrots; they should be sown in drills from 15 to 18 inches apart, and about an inch deep. The seeds being smooth do not require to be mixed with soil like Carrots; but in every other way they may be treated alike. Drilling crops, where it can be done, is far more convenient than sowing broadcast, as the intermediate spaces can be easily cleaned and stirred up, which is of great benefit to the plants. A sowing of Beans may now be made. If the first sown Peas are not already staked, it should be done without delay; if they are not sufficiently earthed up, draw a little more to them before staking them. Sow some to come in in succession, four feet apart, to make room for Spinach to grow between them. It is time for getting in Potatoes, planting them about 2 feet apart. A sowing of Curled Parsley should also be made without delay; it delights in a good fresh soil. A small patch of Radishes should be sown, for succession, about once in three weeks. Lettuces, Celery, and Cauliflower, may be sown in a warm border, the latter to succeed those that should now be planted out. *Flowers.*—Do not uncover anything that is tender for a short time yet. Continue to dress the borders *Fruit.*—Get Strawberry-beds (if any) weeded, before the plants have grown much, and keep down weeds wherever they appear.—*M'H.*

State of the Weather at Chiswick during the last 18 years, for the ensuing Week ending April 13, 1844.

April	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

March 29th Dense fog; dry haze; overcast
30th Dry easterly haze; fine; overcast at night
31st Slight haze; exceedingly clear and fine; foggy
April 1st Foggy; dry haze; fine; clear and fine at night
2d Slight frost early A.M.; very fine; clear and mild
3d Fine; very dry air; clear and fine at night
4th Very fine throughout
Mean temperature of the week, 5.2 deg. above the average.

Notices to Correspondents.

BOOKS.—*A Bachelor.*—Bevan on the Honey Bee.——*Rusticus.*—Mangles's Floral Calendar; apply to the booksellers.

CHARCOAL.—*Beginner.*—Prepare it from the softest wood you can get. Possibly your Pines are over-watered, without being enough exposed to light.

CONSERVATORY.—*T. J.*—A span-roof by all means, and if possible, running north and south. Glaze with the largest panes of sheet-glass, if you do not mind the expense, and heat it by hot-water pipes, cast with evaporating pans. Brick water-gutters will not answer for a conservatory in winter. Have a tank inside in which you can keep water of the same temperature as the air of the house. Such a tank may be fed with the rain that falls on the roof.

CARNATIONS.—*Lumbo.*—These, Picotees, and Pinks will grow in almost any kind of soil; but they do best in a light rich mould, consisting of old turf, well-decayed dung, leaf-mould, and sand. For their management, see to-day's Calendar.‡

CROCUSES.—*Delta.*—Both these and Snowdrops like a warm, dry, light soil, in which they will thrive for many years without requiring removal. Both are, however, better for being taken up occasionally, because in that way their roots are exposed to fresh soil, and are not obliged to search through exhausted earth for their necessary food. They are fond of cow-dung as a manure; it may be applied just after Christmas. Transplant all Evergreens in November if you can, and when the weather is wet. The worst of all times is the spring, when the easterly winds prevail.

EVERGREEN BEECHES.—*Paris.*—It is true that the Evergreen Beeches have been lately received, in a living state, by Sir W. Hooker, at Kew. There has not, however, been as yet any multiplication of these rare plants, which are seedlings. It is hardly to be expected that they will be hardy in those parts of Europe where the cold is intense in winter.

FOUNTAINS.—*M. C. M.*—I should recommend the supply-pipe to be six inches diameter in the bore, where the ground falls rapidly; four inches in the level part, and three inches in the length, which ascends to the fountain. The six-inch pipes should be of half-inch metal, and the others three-eighths of an inch; the lengths may be united by flange joints, but turned and bored joints are more secure and lasting. The nozzle should be made of brass, trumpet-shaped, and the orifice one inch in diameter. The supply-pipe must be kneed from the level to the upright position, with a flange to unite to that on the bottom of the nozzle. It will be found advisable to try the effect by wooden nozzles, of various sized orifices, before the permanent one is made. The small pipes which are to supply the house and offices should, at their junction with the main, be very stout, and about half an inch bore. Considering the head of water, if these rules are followed, the jet may be expected to rise from 60 to 70 feet, providing there is an ample supply, of which "M. C. M." says nothing. I know of no work treating of fountains, which would afford information applicable to the case in question.—*Joseph Paxton.*——*T. J. M. A. P.*—Next week if possible.

FRUIT-TREES.—*J. B. K. Z.*—On the south aspect, inside, the following trees will be proper:—Peaches, Royal George, Bellegarde, Noblesse, Malta, and Berrington; the Elruge, and 2 Violette Hative Nectarines; 2 Moorpark Apricots. For the south aspect, outside:—Cherries, 2 May Duke; 1 Knight's Early Black; Plums, 1 Royale Hative; 2 Green Gage; 1 Coe's Golden Drop; Glout Morceau; and Beurré Rance Pears; and the Mulberry you wish to have. For east and west aspects:—The Royal, Orange, Roman, and Moorpark Apricots; Plums, 1 Kirke's, 2 Purple Gage; Pears, 4 Winter Nelis, 4 Hacon's Incomparable, 2 Marie Louise, 2 Passe Colmar, 2 Glout Morceau, 1 Thompson's, 2 Easter Beurré, 2 Knight's Monarch; Cherries, 2 Elton, 2 Florence.‖

GRAFTING.—*J. Jeffrey.*—One year old wood of the Purple Beech will not take with any certainty. Two years' old wood will never fail; we have not tried three years' old wood.

INSECTS.—*J. Took.*—The Cucumber-leaf was so crushed, that it was impossible to examine it. I should feel obliged by having a fresh leaf, with some of the little beetles upon it, and as many as you can conveniently send in a pill-box. Say, also, at what period of the day, or night, they are eating the leaf, and if there be any season when they are more abundant than at present. *R.*——*A Beginner.*—Old Cabbage leaves laid in your Mushroom-beds will attract the woodlice, when they may be collected and killed every morning. As they harbour in the decaying wood of the frames which rest upon the soil, boiling water may be poured round that part inside and out; but one of the best remedies is to keep one or two *toads*, not frogs, in each frame. *R.*——*A. F.*—Your enemies are a species of woodlouse, called Oniscus murarius; kill them by the modes above recommended. *R.*——*Monmouth.*—Fumigating with tobacco will, in all probability, destroy the red insects; but we must beg of our correspondents to transmit specimens, without which it is impossible to give satisfactory answers. *R.*——*J. C. K.*—The foliage of your Fuchsias is undoubtedly eaten by some insects much larger than the one you placed in the quill; which, however, had escaped for want of being stopped with a *cork*. If you will examine your plants by night, I expect you will detect the culprits feeding. *R.*

LAWNS.—*Penthesilea.*—If you water your lawn well with gas-water and water, it will kill the Moss, and improve the Grass. Do not be alarmed if you should seem to have killed the Grass also, for that will recover. ‡

MANURES.—*H. J. D.*—For the price of superphosphate of lime see our advertising columns. Apply it to Pelargoniums now, as a top-dressing, about a wine glassful to a plant, and just scratch it into the soil.——*Mercator.*—Superphosphate is used in kitchen-gardens at the rate of 3 or 4 cwt. an acre. Oranges love a rich free soil—even such a manure as charcoal soaked in blood. They will, however, never thrive unless they are kept warm at their roots, and have plenty of room to grow in. Peat, loam and sand, equal parts, form a soil suitable to the Gladiolus.——*Rhodon.*—Three or four cwt. per acre of Potter's guano will probably be sufficient for your Roses: we do not, however, know what the maximum quantity is that may be advantageously used. Much, moreover, must depend on the condition of your land.——*M. A. B.*—Use Potter's guano as a top-dressing, and prick it in. As far as our experience goes, it suits everything; but we have not seen it tried on Coniferous plants. A good companion for a Petunia in a vase would be a Purple Salpiglottis; or, if you cannot get it, one of the taller purple Verbenas.——*H. C.*—Mix lime with your guano, and if you perceive strong ammoniacal fumes, it is probably good. There is no certainty about it, however, without careful analysis. The African guano is said to be good; but if it is very wet, you will have to buy water as well as guano; and as you have probably enough of that at home, it must of course be taken into consideration. Take a pound of the wet guano, put it in the sun to dry, and weigh it afterwards. The difference will be the water.——*J. A.*—It is worth trying whether water from gas-works would improve refuse hair. We have no experience with it.——*Guidenet.*—The superphosphate of lime, or Potter's guano, rather than the Peruvian. Apply them as a top-dressing; just fork them in, and leave the rest to the weather, unless it should remain very dry, in which case it will be necessary to water the border. Apply at the rate of 4 cwt. per acre.

NAMES OF FRUITS.—*J. Waldron.*—Dumelow's Seedling.‖

OAKS.—*R. F.* may prune Oaks and Beeches now. Mr. Glendinning, Turnham Green.

ORANGES.—*J. A.*—Your Oranges drop their blossoms because their roots are too cold.

PEARS.—*An Original Subscriber.*—The Winter Crassane differs from the old Crassane in having the eye in a still larger cavity; but if you plant both side by side you will soon discover a most important distinction, for the Winter Crassane will bear most abundantly as a Standard, whereas the other will not. You will find a figure and description of the Louis Bonne of Jersey, at p. 860 of last year's *Chronicle*. Thompson's Pear resembles in appearance the Passe Colmar; but the leaves differ in being somewhat downy, and the fruit is more buttery. You have probably been too late in heading down your Quince-stocks. If this is not done early they are very apt to canker at the graft in the manner you describe. They ought to be headed down in January at the latest. You must not cut those you budded quite close to the bud at present, nor till they are fairly in leaf.‖

PICKLING WOOD.—*B.*—Apply to John Bethell, Esq., 78, King William-street, City, for Creasote.

PINE SEEDS.—*K. O.*—Sow them now in sandy loam, in a cool Cucumber frame. Remove them to the open air as soon as up, if the frosts are over. Pot them as soon as they form their second leaves, and plant them out as soon as they are six inches high. Do not crowd them; and never let their roots become spiral.

PLUMS.—*A. H.*—The Myrobalan Plum is Prunus cerasifera—quite a distinct species. Thanks for the information, which we have used elsewhere.

RABBITS.—*S. S.*—We are not acquainted with the mode of destroying Rabbits by smearing Cabbage-leaves with poison. You may surely trap or snare them, if you cannot shoot them.‡

SEEDS.—*R. C. R.*—Of your seeds the following are worthy of growing:—Lagerstrœmia Reginæ, Eranthemum nervosum, and Convolvulus Lacteus.‡

SHRUBS.—*Sarah.*—The following ornamental evergreen and deciduous plants may be recommended for planting in a shady situation in London: Common and variegated Holly, Aucuba japonica, Laurustinus, Berberis aquifolium, Viburnum opulus, Cytisus Laburnum, Common and Persian Lilac, Ribes sanguineum, Cornus sanguinea, Hypericum androsæmum, H. calycinum, and Symphoria racemosa.‡

SLUGS.—*An Amateur.*—Lime-water applied night and morning, when the slugs are feeding, will soon rid you of such vermin. Or gas water is much better, provided you can apply it without its touching your plants.

THE ROSE-GARDEN.—*J. L.*—Patience is a virtue, and we must beg of you to exercise it. It is not our intention to resume the articles under this name for a few weeks, as all that relates to the actual season is already printed. You may expect their re-appearance about the beginning of May.

THORNFIELD PINES.—*Three Gardeners.*—Obliged by your information; but you must give us your names if we are to use it.

MISCELLANEOUS.—*Egg.*—We know of no means of preserving the colour of birds'-eggs except keeping them in the dark.——*W. M.*—Helonias asphodeloides thrives perfectly in a peat border among American plants, where it is shaded, but not overshadowed. It then flowers every year.——*Jason.*—It would be very unfair of us to answer your question. There are doubtless many professional men who are excellent landscape gardeners, and it would be invidious publicly to name one in preference to another.——*Anon.*—We have no idea to what you allude. Many plants have an acrid juice, and will raise blisters; as for example the Crowfoots and Clematis flammula.——*Anglus.*—Leaf-mould that is well decayed may be used instead of Bog-earth for American Plants.‡——*G. F. H.*—By application to the Secretary in Regent's Park. Verbenas like a light rich soil: it is too early to plant them yet.‡——*Rhodon.*—We are not acquainted with the Rhododendron "Gloire d'Haarlem." We have had no experience with Potter's guano for American plants.‡—*Col.*—The meetings of the Horticultural Society are on the first and third Tuesdays of the month, with certain exceptions, which can be learnt at 21, Regent-st.——*C. R. D.*—No doubt your Gooseberry bushes have been attacked by birds.——2*s.* 6*d.* will be given for No. 33 of 1842.

SEEDLING FLORISTS' FLOWERS.

CAMELLIA.—*W. B. T.*—The variety of which you have sent a specimen is not known: its principal merits consist in its colour and the texture of the outside petals; the centre is very bad, being partially filled with small narrow petals. *

CINERARIAS.—*W. M.*—Queen of the Fairies is like so many varieties we have with delicate-coloured tips to the petals, that it is impossible to distinguish it from many others. Model forms a more decided variety, being a mixture of purple and azure. Single flowers are not sufficient to form an opinion upon.*——*C. L. N.*—Seedling No. 1, a bright blue. The flowers of this variety are rather small; but they are very abundant, and bright and beautiful in colour. No. 2, pure white centre, with the termination of the petals of a delicate azure blue. This is also an abundant bloomer, with well-formed flowers, lively in appearance, and forms a distinct and desirable variety.*

PANSY.—*T. O. G.*—Everton is a fine, large, well-formed seedling, with well-proportioned petals of a velvety texture; upper petals of a very deep purple, with a perfect broad belting of the same colour round the side and bottom petals; eye dark, ground-colour yellow: it wants a little more decision where the belting joins the ground-colour.*

RHODODENDRON.—*C. L. N.*—The seedling hybrid Rhododendron is a very compact and handsome variety, the blotche of white with the deep rose colour of the outside of the flowers, contrasted with the delicate and spotted inside, give great richness to its general appearance: the fringed edge to the corolla is a defect. *

SCARLET GERANIUM.—*W. M.*—Fireball is a bright colour but not surpassing in this respect many others; and the habit of the plant we are ignorant of.*

*** As usual, many communications have been received too late.

TO THE FARMERS' CLUBS AND AGRICULTURAL SOCIETIES, in Gloucestershire and the adjoining Counties.—It having been suggested to me, by Mr. Hyett, of Painswick, that it would be desirable to place within the reach of the farmers, upon reasonable terms, the means of obtaining the analysis of the various manures of commerce now coming into use, so as to estimate their commercial and agricultural value, I have determined to offer my services to the several Farmers' Clubs within my neighbourhood, upon the following terms, viz.: that upon being appointed Chemist to any Club, with an annual fee of 5*l.* 5*s.*, I will analyse for their members, at the undermentioned reduced charges, viz.:—

1. *Manures*.—Testing saline manures, such as guano, the nitrates of soda or potash, bone-dust, rape-dust, &c., for adulterations, for each sample, 3*s.* Examining, with a view to its commercial and agricultural value, any of these manures, so as to detect the quantities of impurity, or estimating the amount of phosphates, or animal matter, contained in any sample of bones, or of organic or of inorganic matter in any mixed manures, 6*s.*

2. *Soils*.—For estimating in a soil the amount of soluble saline matter, or of lime, clay, silex, phosphates, gypsum, organic matter (humus), &c., or the power of retention of water by a soil or subsoil, as indicating the necessity of draining. for the estimation of one ingredient, 5*s.*, and 2*s.* 6*d.* for each additional one.

3. *Earths*.—Examining limestones, marls, &c., to ascertain the proportion of lime, and presence of magnesia, alumina, or silex, 5*s*; ascertaining the proportions also of either of the latter, or any other ingredient, 2*s.* 6*d.* extra for each.

4. *Products of Vegetation*.—Examining the ashes of a plant, to determine the proportion of one ingredient, 5*s.*; the proportion of every other, 2*s.* 6*d.* additional for each; and for examining, to determine the quantity of water, starch, sugar, gluten, vegetable albumen, or woody fibre in Turnips, Potatoes, Mangold Wurzel, Wheat, &c., 5*s.* for the first, and 2*s.* 6*d.* for each additional ingredient; and for determining the quantity of oil or fat, and of other proximate principles, requiring expensive re-agents, in any agricultural crop, 5*s.* each.

5. *Dairy Produce*.—Estimating the amount of casein, fat, sugar, or salts, contained in milk or cheese, with a view to comparing the produce of two or more breeds of cows, or of different modes of feeding, for each ingredient, 5*s.*

6. A Lecture on any Agricultural subject, 3*l*, to 5*l.*

7. For chemical advice generally, on Agricultural subjects, the charge must be regulated by circumstances.

8. Water or liquid manure examined, with respect to its fitness for irrigation.

I am, gentleman,
Yours, most obediently,
A. GYDE.

Painswick, March 26.

TO AGRICULTURISTS, MINING PROPRIETORS, MANUFACTURERS, and OTHERS.

ROYAL POLYTECHNIC INSTITUTION.—The department of ANALYTICAL CHEMISTRY and Chemistry applied to the Arts, Manufactures, and Agriculture, now offers considerable advantages to parties engaged in the above-mentioned pursuits, both as to the moderate scale of charges, and the punctuality and accuracy with which all Analyses are conducted. The Chemists may be consulted at the Institution daily, after 11 o'clock, or in the country, if required. Simple Assays, one guinea each. Analyses, from one guinea upwards. Where business is regularly sent to the Institution the charges are reduced. R. J. LONGBOTTOM, Secretary.

The Agricultural Gazette.

SATURDAY, APRIL 6, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, April 10, Agricultural Society of England.
THURSDAY, April 11, Agricultural Imp. Soc. of Ireland.

WEDNESDAY, April 17, Agricultural Society of England.
THURSDAY, April 18, Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.—April 8 { West Hereford. Wickham Market.

DURING the years 1842 and 1843, upwards of 400 experiments with manures, of which we have the manuscript report, were made by Mr. Lawes, whose name will be recognised as that of an intelligent writer in the *Agricultural Gazette*. We mention this to show that the opinion of this gentleman on the general subject of experimental farming is well worthy of our attention. It will be seen from the following remarks by him, that his extensive experience in this line fully proves the amount of error to which experiments are liable, from the influence of other causes than those specially employed by the experimenter. The way to remedy this is—either as already pointed out on many occasions, and as Professor Henslow has put in practice—by collating the results obtained from the action of the same cause, by different observers, under a great variety of circumstances, or by—what is very similar—increasing. not the number, but the extent, of the experiments. Mr. Lawes writes as follows:—

"I venture to offer some remarks upon this subject, having been engaged during the last few years in performing a variety of experiments, and having wasted a great deal of time and money, from ignorance of the precautions necessary to obtain an accurate result. A person wishing to try a variety of experiments is naturally anxious to perform them upon as small a space of land as possible. I have divided whole fields into spaces of the fortieth of an acre; and although the greatest possible care was taken to ensure accuracy, the results were unsatisfactory. I have since ascertained, by careful observation, that equal spaces of land measuring the fortieth of an acre, unmanured, or manured with the same substance, yield weights which vary in the proportion of 1 to 1¾. The greatest variation occurs in Clover and Grass; and I am inclined to think that half an acre is the smallest quantity of land that ought to be used for one experiment upon these crops. The manures should be reduced to a fine powder, and sown by hand when the Grass is beginning to grow; I prefer the month of April, a rainy day being selected for the purpose. The Grass should all be cut the same day, and treated in every respect alike, until it is fit to carry. Each experiment should be made into a separate stack, and thatched; the weights should be taken about two months after the Hay is carried.

"Experiments upon Wheat, Barley, and Oats, may be performed upon a quarter of an acre. I prefer the beginning of May for top-dressing with soluble salts, such as sulphate of ammonia, guano, &c. In harvesting the experimental portions, they may either be made into stacks in the field, or they may be threshed out at once in the barns. Experiments upon Turnips may be conducted upon much smaller spaces of ground, provided a space of not less than 27 inches be left between the rows; the fiftieth of an acre will give a very fair result, particularly if the Turnips are sown upon the ridges. A space of 129 yards long, by 27 inches, is about one-fiftieth of an acre. If a portion of ground of this size is used, a drill should be employed to sow the Turnip-seed, and the manure should be strewed by hand down the marks made by the drill, a light roller being passed over them to cover the manure. The seed should be sown very thick, to prevent injury from the fly; and to enable the Turnips to be set out at equal intervals, each row should contain an equal number of Turnips. The Turnips should be weighed about the beginning of December; all the roots, dirt, and tops, should be completely removed, and the bulb weighed. This is the only fair way of estimating the weight of a crop of Turnips, and if it were done, we should not hear so often of crops weighing 30 tons per acre."

No kind of experiments can afford more useful results than those instituted for the purpose of ascertaining the limits within which the results of other experiments can be depended upon. Mr. Lawes refers here to the effects of manures alone, and a good deal of the variety there noticeable is, it appears, owing to variety in the soil, and to other disturbing causes. There are many kinds of experiments connected with the soil, to each of which the above remarks by Mr. Lawes will apply, as they are all equally affected by the same sources of error; such are experiments with different varieties of any plant, for the purpose of determining the one of greatest productiveness. But there is another class of experiments, of great importance to the farmer, which aim at the determination of the nutritive properties of different kinds of food, or of the fattening tendencies of different breeds of sheep and cattle; and in these we can say, from experience, that the greatest care is required in drawing accurate inferences from the results arrived at.

We have no doubt that, were a sheep-farmer to divide his flock into tens, and observe them weekly, he would often find as much difference between these different lots, though fed and treated alike, as another would who had treated his lots variously, feeding one on Carrots, another on Swedes, a third on Field-beet, without hay, and a fourth, fifth, and sixth on all these, with hay. It requires a whole season at least, and a flock ten or twenty at least in number, to determine the merits of any peculiarity in the management of sheep. And while on this point, we may just mention one particular which appears to have been overlooked by experimenters on the value of different roots as food for cattle or sheep. A great source of error in all such experiments lies in the fact, that most of the different roots grown by the farmer come to perfection at different times during the year. The common Turnip should be all consumed by November, the Swede by March, while the Mangold Wurtzel and Carrot are as good, or even better, during the months of April and May as at any period while they are fit to eat. Thus, of two experiments with Swedes and Beet made on different lots of sheep, the one in December and the other in May, the former would probably result in proving the Swede to be the most nutritive food, and the latter would probably justify a preference of the Beet. We cannot tell how far to depend upon such experiments till all their details are made known.

"IT will soon be SEED-TIME FOR THE MANGOLD-WURZEL. This plant prefers a light soil, but will succeed on much heavier land than is suited for Turnip culture. It should be sown before the end of April. The land (a Wheat or Oat-stubble ploughed deeply in autumn), having lain exposed to the action of the weather during winter, will then harrow down to a fine tilth. It should be ploughed, not very deeply, about ten days before sowing; and, if the weather be warm and drying, the harrow and roller should follow close upon the ploughman. When, after repeated harrowings, the soil has been rendered sufficiently fine, the manure may be laid on; and in doing this, either of two ways may be adopted. It may be applied broadcast, *i. e.*, it may be emptied out of the carts in heaps at the rate of about 20 tons per acre, and spread evenly over the surface; after which, it should be immediately ploughed in, and then the land should be harrowed, rolled, and bouted up for sowing as soon as possible; or the manure may be applied in the drills, and this is generally the more economical plan. In this latter case, we suppose two ploughs to be at work; the land is first ribbed by these, a furrow being turned out, and a drill formed every 26 inches. As soon as a few drills are thus formed, the carts with manure are led up the centre of each three, and a man pulls out the load at a regular rate without stopping the horse. Supposing he has been directed to apply 20 tons per acre, he should then spread a load of 15 cwt. over about 84 yards in length. This is divided amongst the three drills to which it belongs, and spread evenly along the bottom of each by three men, who follow close behind the carts. The ploughs, by which 12 drills may by this time have been formed, three of which are then filled with manure, instead of continuing merely to bout up fresh drills, should now work round and round those already prepared; on the one side, splitting those first made in which manure has since been laid, covering it up, and leaving the land ready for the seed; and on the other, opening new furrows. There will thus never be more than 12 drills open, and in never more than six is there manure lying exposed to the air. Two ploughs, with manure-carts and men to keep them going, will get over 5 or 6 acres a-day. The land as it is thus left, should be rolled and sown as soon as possible. If it be in fine tilth, and the ploughman skilful, the drills need not be formed by a complete bout of the plough; they will be sufficiently well made by a mere ribbing of the land.

The seed should be sown as soon as possible after the drills are ready to receive it. It should be dibbled in by hand. We have not seen the machines at work which are described in some publications, for forming the holes to receive the seed; but from the statements of others we believe that they greatly facilitate the work. Before sowing, the drills should be rolled lengthways by a light roller, in order to flatten them, render the ground firmer, and hinder any chance of the dibbles being pushed in too far. This is of great consequence, as the seed is very easily buried and destroyed. To guide the dibblers in this work we have been accustomed to use a wooden roller about one foot in diameter, having upon it at intervals of one third of its circumference, strips of wood of triangular section nailed lengthways. These, as the roller passes up and down the drills, make marks across them at equi-distant intervals of about 12 inches. The seed is sown upon these marks, and thus comes up regularly over the field. The women and children who plant the seed use a short dibble, which they learn to press only half-an-inch into the land; they have a small bag of seed tied round the waist, and they hold a little of it in the left hand, from which by the action of the thumb and fingers they separate two or three berries at a time. They stand on the left side of the drill to be planted, with the right foot upon the top of it; bending, and stepping forward with the left foot, they strike a hole in one of the aforesaid marks, and on lifting out the dibble they place the two or three seeds, which they have ready between the fingers and thumb, in the hole thus prepared, and without lifting it they drag or slide the right foot along the top of the drill and cover the seed up. The covering is done wholly by the right foot, which rests above and presses the seed thus covered, while the left takes another step of 12 inches, and the hands are employed as before, first the right in forming the hole, and then the left in placing the seed, after which it is again brought forward to cover up. A great deal depends upon the proper division of the work among the feet and hands, and on each member performing its appropriate office. When once a labourer gets into the way of it, he can perform his task so rapidly that it appears as if he were running along on all-fours.

The quantity of seed thus sown varies from five to seven lbs. per acre. The kind of seed to be sown should be one of three kinds—the long red, and the red and yellow globe. Last year, by weighing two or three successive rows of each kind, we ascertained that there was a produce of 31½ tons per acre of the first, and 33¼ and 33½ of the second and third. The globe Beet is believed to be of the best quality.

Each of the berries in which the seed occurs contains three or four seeds, so that from the two or three berries which are sown at each spot in order to ensure plenty of plant, a little bush of plants springs, and whenever these get sufficiently large they must be singled out. Before doing this, however, the land should be horse-hoed. This pulls down the ribs and fills up the furrows, leaving untouched a space of only 3 inches wide up the centre of each drill, in which the plants are situated, and this is easily cleaned by the hand-hoe. Not only waste of time, but injury to the plant, is frequently committed in this operation, by the care which the hoer takes to treat the young plant gently. The proper way to do it is this:—The little 3-inch-wide ridge in which the bunches are situated should be knocked away by a push from the hoe, directed so as at the same time to knock away one third of one of the bunches; the effect of this is, to leave two or three of the centre plants of the bunch unsupported, which accordingly fall down

upon the space cleared by the hoe; another well-directed blow, a pull of the hoe as it returns, will clear away the rest of the bunch, and then, of the two or three helpless plants remaining, one may be selected, and the rest cut off. A field thus treated looks very forlorn immediately after hoeing, but the advantage of the rough treatment shows itself in a very few days by the vigorous growth of the young plants.

We shall speak more fully, when on the subject of Turnip culture, of the advantages of repeated horse-hoeings as long as the rapidly-growing leaves of the plants will permit it. At present, we leave the cultivation of the Field-Beet till its harvest time.

ON THE FERTILISERS OF COMMERCE.

To the farmer who reflects that all increase in his crops beyond the average which covers his costs of cultivation, &c., is clear profit to himself, any mode by which such increase is likely to be effected should be matter of serious consideration. Attention has lately been called to the very extraordinary returns from some of the manures of commerce; from the many which have been published I shall content myself with citing the following instances.

From nitrate of soda, applied to Wheat, the increase has frequently been great. Mr. Bubb, in the report of the Gloucester Farmers' Club for 1842, shows a profit of 19*s.* 5½*d.* per acre; for the last year he has informed us of still greater, and this upon a considerable scale. Mr. E. Solly, in the third volume of the "Transactions of the Horticultural Society," second series, reports an increase of more than ten bushels per acre; and on certain trials, which I reported in the second volume of the Royal Agricultural Society, I netted 2*l.* 17*s.* per acre.

In the "Transactions of the Highland Society" for July, 1843, in the report of some experiments (for which the Society awarded a premium of 20*l.*), made by Mr. Maclean, of Braidwood, on the increase of Hay, by the use of some of these manures, we find, among others, these results:

Manure applied.	Value of Increase, after deducting cost of application.
Rape Dust	£1 6 0
Guano	3 18 0
Saltpetre	4 15 0
Nitrate of Soda ..	5 0 10

Mr. Hannam, also, from near Wetherby, in Yorkshire, in his elaborate series of experiments, for which the Highland Society awarded a premium of 50*l.* (V. "Highland Society Transactions," No. 4, new series), gives, among a great variety of other interesting results, the following:

ON TURNIPS.

Manure applied.	Quantity used per acre.	Increase per acre. ton.	cwt.	stone.
Bones crushed..	16 bushels	7	4	
,, burnt....	16 ditto	9	16	4
Bones and Guano	12 ditto 1 cwt.	10	7	6
Bones and Rape Dust ..	12 bushels 6 ditto	10	14	5
Guano, drilled..	2½ cwt.	6	17	0
Guano, sown ..	2½ cwt.	14	19	5

ON OTHER CROPS.

Manure applied.	Potatoes. Quantity applied.	Increase per acre.	Barley. Quantity applied	Increase p. acre	Hay. Quantity applied.	Incr. per acre.
		bushels.		bushels.		st. lbs.
Guano	5 cwt.	59·6	2 cwt.	15·54	2 cwt.	52 0
Nitrate of Soda ...	1½ cwt.	76·9	1½ cwt.	14·22	1 cwt.	72 12
Nitrate of Potash..	....	....	1 cwt.	11·16	1 cwt.	25 10

I have selected the above examples from amongst the most successful, merely to show, when they do succeed, how great the profit may be to the farmer. But it by no means follows that there is not another side of the question; doubtless there is—failures perhaps are even more numerous. These manures are very often most uncertain and capricious in their effects—and I would strongly advise that no one should embark in them largely without first ascertaining, by trial on a small scale, the probability of their success, both as regards the crop and soil to which he thinks of applying them afterwards.

Presuming, then, that this is ascertained in the affirmative, these manures would seem to be of the greatest importance to the farmer; especially in those districts like our Cotswold hills, where farm-yard or town manure is seldom to be obtained in sufficient quantities. The introduction of a substance which could be purchased at any market-town, as for instance guano, at 11*l.* or 12*l.* per ton, from 2 to 4 cwt. of which per acre would go as far as a fair dressing of common dung, would be no inconsiderable boon to the farmer. Now this is all very promising—but it is not all gold that glitters. There are other drawbacks against which due caution must be exercised. When we have ascertained one year that the manure in question is likely to succeed on a given crop, we are by no means sure the next year of getting the genuine article; thus a serious loss to the purchaser may be incurred, not only in the article itself, but still greater on the year's crop, which, under different treatment, might have given very profitable returns. Let us see how the case stands in figures. Mr. Potter, in a little pamphlet entitled "A word or two on the use of Guano," tells us that it is sometimes found to contain 40 or 50 per cent. of inert sand. I have heard of some said to contain 65 per cent. Dr. Madden states, in one of his lectures "On the advantages of extended Chemical Analysis to practical Agriculture," that samples of nitrate of soda have been analysed and found to contain as much as 26 per cent. of common salt. I have seen a specimen which has also been analysed and contains more than 30 per cent. of foreign matter. Mr. J. B. Lawes, who, as a manufacturer of superphosphate of lime from bones, consumes two tons of bones a day, and is therfore a competent witness, states in the *Agricultural Gazette* that bone-dust is sold containing about one-third of lime. Suppose a farmer about to manure 20 acres with these impure substances, what would be his loss?

Manure.	Price per ton.	Impurity per cent.	Quantity used per acre.	Loss to Buyer on 20 Acres.
	£ s. d.		About	£ s. d.
Guano	11 0 0	50 Sand.	3 cwt.	16 10 0
Nitrate of Soda..	19 0 0	25 Salt.	1 cwt.	4 15 0
Nitrate of Potash	25 0 0	25 (27) Salt.	1 cwt.	6 5 0
Rape Cake	8 0 0	15 (27)	8 cwt.	6 8 0
	p. quarter			
Bones.....	1 0 0	33 of Lime.	20 bushels	16 10 0

Thus a farmer purchasing guano or bones for 20 acres of land would be a loser, first of 16*l.* 10*s.* on the article itself—and would only have half a crop on the land to which it was applied. Any one using 20 tons of foreign Rape-cake for food for cattle, which is said to be sometimes mixed with sand, if it contained only 10 per cent., would be a loser of 16*l.*, to say nothing of the injury which his cattle might sustain. It is by no means intended that these instances of impurity are altogether the result of adulteration. Indeed, it is known that most of these manures, in their natural state, are found mixed with large and varying proportions of foreign matter—and, if adulterated, that it is done before it reaches the hands of the merchant in this country; still, the loss to the consumer is the same, no matter how it happens. But even this is not the worst feature of the case; a few instances of disappointment will bring the genuine article into disrepute, from which it will not easily recover, and the advantages which might have arisen be lost to the country for years to come. The question then is how to prevent it?

The Scotch have formed a society for the purpose of employing a chemist at a salary of, I think, 600*l.* a year, who is to analyse for its members, at the reduced charge of a few shillings for each analysis, substances interesting to farmers; amongst others, especially these manures of commerce, so as to give at once their agricultural and commercial value. Thus a member of the association, who is desirous of testing any of them, has only to inclose a very small sample by post to the chemist, with the amount of charge for having any particular question answered, from 3*s.* to 6*s.*, or thereabouts, and in a few days he will receive an answer, which will probably save him from all the losses and disappointment before alluded to; and instead of paying for the article some 25 or 50 per cent. beyond its real value on a large order, he would be sure of his money's worth. Moreover, the chance of an impure article being ever sent into the country where a chemist is appointed, would be greatly diminished by the knowledge that it was likely to be analysed on its arrival. I am not about to propose to you to enter on any scheme so great as that of the Association of Scotland; but in a much smaller way it has struck me that results equally useful to the practical agriculturist may be obtained. I have applied to my neighbour Mr. Gyde, who, as an analytic chemist, from the variety of delicate and elaborate analyses in agricultural chemistry which to my knowledge he has performed, I believe to be as competent to the task as any one, at least in this neighbourhood, to know whether it would not be worth his while to offer his services to the Farmers' Clubs in this neighbourhood on such terms as would come within their means; and I am happy to say that he consents, upon being appointed chemist to any Farmers' Club, with an annual retaining fee of 5*l.* 5*s.* from each Club, to analyse for its members on terms similar to those of the Scotch chemist. I am aware that the subscriptions to Farmers' Clubs are very small, but I think, when the important objects above named are considered, there will be no difficulty in raising such a sum yearly by a subscription for the express purpose, from the richer members, if necessary. For further particulars I refer you to the letter of Mr. Gyde, advertised in this day's Paper, and if any Club think it worth while to encourage the scheme, I will thank their Secretary to signify the same to me, or to Mr. Gyde.—*W. H. Hyett, Painswick House, March* 26, 1844.—[This valuable article appeared in the *Gloucester Chronicle* of March 30th, as a letter to the Farmers' Club of the West of England, and we are glad to have the opportunity of publishing it here at the request of its author.]

ON THE ORIGIN OF MOULD.

As you have noticed a communication made by me to the Geological Society in 1837, on the Formation of Mould, I should be much obliged if you would correct an error into which I have fallen. In a postscript to that paper I state that marl was put on a pasture field, since ploughed, 80 years ago: I should have said 30 years, as I mistook the figures in the paper sent me. I found out this on visiting the place four years and a-half subsequently, and examining the old occupier of the farm. Wishing to ascertain the accuracy of the stated depth at which the marl now lies buried, I had three long holes dug in different parts of the field, and in each I found the marl, together with some cinders and broken pottery, in a layer 13 inches beneath the bottom of the potato-furrows, which were about four inches beneath the general surface; so that these substances are now buried at a depth of no less than 17 inches. They will never, probably, be undermined by the worms, to any much greater depth, as they almost rest on the general substratum of pure white sand. I particularly examined the occupier, whether the field had ever been ploughed to a greater depth than six or eight inches, and he positively assured me that it never had. My original informant, therefore, rather underrated the depth at which the marl now lies; although probably in the interval of four and a-half years, between our observations, some soil may have been removed by the worms from beneath the marl. In the other fields, formerly examined, I found that the layers of lime and cinders were, in almost every case, about an inch lower than they previously were. It was curious to observe in some of the holes how distinct three layers were preserved; the uppermost of cinders being two inches beneath the surface (on the former occasion one inch below), the middle layer of lime at four inches, and the lowest of cinders and burnt marl, at from 10 to 12 inches. I found this lowest layer wherever I dug, and likewise the other layers, but less regular, owing to different parts of the field having been limed and cindered at different periods. When digging in this field, after a long drought, I noticed, that one single clod of earth, about as large as a man's two hands, was penetrated by eight upright, cylindrical worm-holes, nearly as large as swan-quills, so that I could see through them. Now this shows the quantity of earth in a small space, which is often probably removed by the worms and brought to the surface. The boggy field mentioned in the postscript to my Paper, on which two years and a half before a thick layer of bright red sand had been strewed, and which, I was informed, was then buried three-fourths of an inch beneath the surface, I found four years and a half subsequently (*i. e.* seven years from the sand being put on) was exactly two inches beneath the surface. In that field (also rather boggy) which I have described in my Paper, as first reclaimed 15 years before, the burnt marl was buried at a depth of four inches; so that in these two cases the rate of sinking, or more properly of being undermined, has been nearly the same, namely, about two inches in seven years. In the fields, however, more particularly alluded to in this notice, in which the marl that was put on thirty-four years and a half before, then lay seventeen inches beneath the surface, the rate of being undermined has been much quicker, namely, three inches and four-tenths of an inch every seven years. This field is dry, and consists of black, poor, very light sandy soil. It has also been ploughed, which may make some difference; though it is clear, from the uniformity of the layer, that the marl must have sunk beneath the depth at which the plough could disturb it before the pasture had been broken up. I am surprised at the red sand on the most boggy field having been buried as much as two inches in the seven years, for I never saw a field on which there were so few worm-castings. One cannot, however, judge of the number of worms in a field from inspection at any one season.—*Charles Darwin, Down, Kent.*

ON THE CULTIVATION OF FLAX.—No. I.

The cultivation of Flax engaged the attention of the farmers of Great Britain and Ireland at an early period, and in certain districts of these countries few farms were without a portion of it, while in others it was scarcely known. Before the introduction of cotton fabrics into general use, the linen manufacture was necessarily one of much importance, and, in fact, it is so still, but in a different point of view. Since the days of which we speak, the manufacture has entirely passed into other hands. Then, the farmer was not only the grower of the crop, but, to a certain extent, the manufacturer also; it was invariably converted into yarn by the farmer's family; and, especially in the north of Ireland, it was also manufactured into cloth, the linen-weavers there being invariably small farmers. The Flax crop, therefore, in those days, was one to which a peculiar value was attached, not only as proving remunerating as an article of culture, but also as affording employment for the female members of their families in its subsequent manufacture. A small patch, at least, was grown with a view of supplying the materials for the manufacture of the household linen, which every frugal housewife knew the value of having done under her own superintendence.

The extent of land devoted to the Flax crop has been for many years past annually growing smaller; and, were it not for the late vigorous movements to extend its culture and introduce a better system of management, its cultivation would soon have been entirely abandoned. By the extension of machinery of late, the quantity of Flax consumed in this country, both for the home and foreign market, has greatly increased, and the growth of the crop having been neglected in this country, the small portion grown being also badly managed, the manufacturers were obliged to look to other countries for their supply. The consumption of oil-cake too, was considerable; and for this also the British farmer was dependent on the foreign market. In the year 1841, the importations of Flax alone amounted to about 80,000 tons, at an expense of from 5,000,000*l.* to 6,000,000*l.*, and if the sum paid for seed and oil-cake be taken into account, the annual outlay could not have been less than from 10,000,000*l.* to 12,000,000*l.** The importance of raising this supply at home was too manifest to escape the attention of those most interested in the matter, and the inquiry instituted with a view of ascertaining how far this could be done, gave the impetus to its cultivation, which is now so rapidly spreading itself throughout the country.

The cultivation of Flax in these counties had, indeed, for many years past been almost exclusively confined to the north of Ireland, but from the defective system of cultivation in general use there, and the still inferior method of manufacture to prepare it for the spinner, the sample produced was generally of a very inferior quality, and consequently brought a low price compared with that paid for the imported article. The small returns thus

* See Reports of the Belfast Flax Improvement Society.

obtained from the crop still further prevented the extension of its culture. Samples were, however, occasionally produced fully equal, if not superior, to any imported, clearly showing that by adopting a proper system of management, a superior article might be produced at home. So great, indeed, was the difference in prices, according to quality, that samples were occasionally produced in the best markets for which 71. per cwt. were readily obtained, while the average price was considerably below half that sum. It was clear, therefore, that a proper system of management only was wanted to enable the home grower successfully to compete with the foreigner. The soil and climate of our own country was abundantly proved to be more favourable to the Flax crop than those even of the countries where the greatest perfection in its cultivation had been obtained. In the Flax-growing countries of the Continent, in Belgium especially, continued dry weather during the seed-time often renders the preparation of the land extremely difficult, and when this is imperfectly performed, Flax of a good quality is rarely produced. The alternations of sunshine, and shower so characteristic of our climate at that period of the season, obviates that difficulty, and when ordinary attention is paid to the preparation of the land, and the seed sown at a proper season, a good braird may almost with certainty be calculated on.

Premising these general considerations regarding the Flax crop, which is now occupying a much larger share of the attention of the farming community than it has done for many years past, I shall endeavour in a few papers on the subject to place before the readers of the *Gazette* the most approved practice both as regards its cultivation and manufacture. I do not, however, feel myself warranted in stating, as some of the advocates for the extension of Flax-culture have done, that there is not an acre of arable land in the country but will grow Flax of the finest quality. It is true that the Flax-plant has a rich range of soil, but like all our cultivated plants, there are soils to which it is decidedly unsuited, and on which its cultivation should not be attempted. There is perhaps no other crop which requires greater attention in the performance of every process connected with its culture and management, but when such attention is bestowed, there are few, if any, will yield a greater return. Nor need any fears be entertained that by its more general cultivation the supply would soon exceed the demand, as this cannot be the case for at least many years to come. The demand has been on the increase for some time past, and there is no good reason to suppose that it will not continue to increase with increased cultivation. An important part of the profits of the Flax-grower has hitherto in these countries been almost entirely neglected, namely, the proper management of the seed, which, of itself, often affords as large a return as some of our other cultivated crops altogether.

Having had more than ordinary experience in the culture and management of Flax, and being connected with the district in which the most important movement for the extension of its culture has been introduced and effectively carried into operation, I hope I may be excused the liberty of assuring my readers that the directions placed before them on the subject will be the result of experience, and that they may be implicitly relied on. I may also add that I shall willingly reply to any inquiry on the subject, through the *Gazette*, when the directions given may not appear to be sufficiently explicit. — *J. Sproule.*

ON THE SOIL AND CLIMATE OF THE SHORES OF THE MORAY FRITH.—No. III.

(*Continued from p.* 202.)

Gravel Banks and Subsoil.—A very remarkable feature of the North Highlands of Scotland, observable on every hill-side, and almost from the tops of the highest mountains to the bottom of our lowest valleys and sea-coasts is the general deep covering of loose sand and gravel over the rocky strata. Indications everywhere exist of the country having been long submerged beneath a great ocean, and it is extremely likely that the shapes of the hills and of the main valleys were impressed on the land before it arose from the deep. The summits of the highest mountains are found strewn over with rifted angular or but partially-rounded fragments (often different in composition from the rocks below), as if they had been for ages islands among the retiring waters; the glens beneath are studded on their opposing sides with numerous terrace-banks and gravelly barriers at various altitudes; and lower still, a general horizontal coast line of gravel invests the whole shores of the Moray Frith at an elevation of about 90 feet above the present high-water mark, which seems to indicate a period of repose in the waters at a time when they extended across the great Caledonian Valley, from Inverness to Fort-William, thereby throwing the northern counties into an island separated from the rest of Scotland. The lip of this general terrace-bank exactly coincides with the summit level of the Caledonian Canal; and the general features of the deposit are—its great regularity round all our coasts, its varying in breadth from a few yards to two or three miles, its being composed of sand and rounded pebbles which rarely exceed the size of a man's head, formed chiefly of granitic and primary rocks,—for the secondary softer strata seem to have been entirely pounded down into fine sand and clay; and sticking on the upper surface of the bank, or at least within a very few feet of the surface, large boulders of rock occur, often of many tons weight, and which appear to have been transported to their present localities at no very distant geological era, upon ice. There is a remarkable absence of organic remains either of animals or vegetables in these gravel beds, except on their very top, or connected with the layers of peat which cover them; but the rocky substances constituting the gravel can often be traced to their original beds, and the directions of the currents from which they were deposited can hence be determined. The scratches on the rocks below, and the component masses of the gravel in the neighbourhood of Inverness, and all along Nairn and Morayshires, demonstrate that the main current proceeded from the south-west extremity of the great Glen towards the north-east; and the primitive boulders from the interior of the country, strewn over the plains of Ross and Sutherland, indicate the same direction; while, on the north-west of Ross-shire, the current appears to have had a course more from the north. In the forms of the hills and valleys we can often trace the course of cross currents and eddies; and although the heterogeneous mixture of substances in the gravel demonstrates the extensive movements which occasionally and at first prevailed among the waters, still it would appear that there were long periods of repose, during which the clays and finer particles subsided; so that even the higher ridges frequently exhibit a remarkably good loamy subsoil. That the course of the waters tended generally towards the north is farther clear from most of the escarpments looking towards the south, and the declination of the ridges being in an opposite direction from them; while it would also appear that the southern front of the hills was most exposed to the currents, as it is a commonly observed fact among the farmers that the northern slopes of the ridges usually have the finest soil, and they are most abundant in clayish particles.

By far the greatest portion of the Agricultural districts in the north rests on the gravel beds and terraces now described, which thus form the common subsoil of the country; and from its open, porous texture and the general admixture of all manner of substances in its composition, that subsoil equalises much the productiveness of all the districts, and renders them less dependent than they would otherwise be on each peculiar or prevailing substratum of rock. In fact, the gravelly subsoil is, on an average, at least 10 feet deep, of which the debris of the immediately subjacent rock forms in general but a small proportion,—although it is remarkable that, on the whole, there is a much greater quantity of clay present than could be expected from the loose appearance of the beds. Indeed, a recent analysis of one of the commonest subsoils about Inverness has shown that it contains upwards of 60 per cent. of aluminous matter, which readily accounts for the rapid growth of trees in apparently mere sand-pits.

This paper having extended to a greater length than I expected, I must defer a sketch of the climate of the north of Scotland to another Number of your Journal.—*G. Anderson, Inverness.*

(*To be continued.*)

MECHANICS AS APPLIED TO AGRICULTURE.

By Mr. Cottam.

(*Continued from page* 203.)

The operations of Agriculture to be performed by machinery may be divided into five classes. 1st. Implements used in tilling the land and in the cultivation of the crops. 2dly. In harvesting the crops. 3dly. In preparing the crops for market. 4thly. Implements used in preparing the food for the stock on the farm. 5thly. Domestic machinery.

Under the first head will come the draining tools—the plough, the harrow, the cultivator, the rake, the roller, the drill, and the horse-hoe. Before I enter upon the implements, I will take the liberty of giving a slight sketch of the great improvement made by Mr. Smith, of Deanston—that of thorough-draining and subsoil-ploughing. This system will prove of great assistance to the Agricultural engineer, because the land can be laid all flat and even, will always be in a fit state to work, heavy rains will have a less injurious effect upon it (if any), and the hot sun in dry weather will not retard the performance of machinery as formerly. This system is clearly shown on the diagram; the drains are to be cut thirty inches deep and eighteen feet apart; the land may then be ploughed four or five inches deep, and subsoil-ploughed fourteen to sixteen inches more: this is only to break up and raise the soil, not to turn it up to the surface. The subsoil plough should follow the ordinary plough: it will take a great power to draw it at first, but it is evident that every year it will take less power to perform the operation. Land so drained and ploughed should be ploughed with a turn-rest plough, that the furrows may be all one way, and the land laid flat, so far as the natural undulations of the soil will permit it; in this state it will be easy to understand how this system will make wet land dry and dry land moist, in that state most congenial to the growth of plants. When the rains come, the water has not to flow from the ridges or stetches into surface drains, washing away all the manures and pabulum of the soil with it, but where it falls there it passes through to the drains, and becomes filtered in its passage, leaving all its virtues behind it; this shows that it is as beneficial to drain the hills as the valleys. If we compare this system with that of land not under-drained, but what is called well drained on the surface, and ploughed in high and narrow stetches (or lands), the subsoil has been what engineers call puddled, that is, trodden down till it is quite hard and impervious to water, and impenetrable by the roots of plants, for it has not been disturbed for years, never having been ploughed more than from four to six inches deep. When ploughed it is laid up in ridges or stetches, the narrow ones in seven furrows; but they are made in various numbers, so that in every five feet you have a drain a furrow wide. Now, if we observe this furrow in harvest time, we shall find if it is a wet season the crop in and on the sides of the furrow all perished, the straw short, and the ears of Corn small and unripe; in a dry season the crop will be dried up and equally as poor. The diagram will show the reason there is no depth of soil to hold moisture. Here, at the best, on the top of the ridge, we have but six inches deep, diminishing in the space of two feet six inches to nothing in the furrow; while in the new system we have sixteen inches of soil to hold moisture. If we wanted to keep anything moist, and we wet a blanket and laid it over it, and found it dry quickly, we should put on four blankets. Now this is a similar case; one has four inches depth of soil, and the other sixteen inches. In a dry season the roots can descend and obtain support. What an advantage does this mode of culture give to the implement-maker! He has a flat surface to work upon, and that in a dry state.

Mr. Cottam now compared the various ploughs, showing the improvements made upon them, referring to numerous models and diagrams, for want of which it would be impossible for us to give even an outline. He showed various ways of setting out the turn-furrow or mould-board of ploughs, as practised by different makers, and particularly one designed by the late Rev. W. Rham, in which, although apparently a beautiful curve, all the vertical lines were straight. He also explained Smith's, of Deanston, new turn-rest plough, and the way the sod was cut, raised, and turned over, referring to numerous mathematical diagrams. After going through the harrows and the cultivators in a similar manner, he compared Finlayson's, Biddell's, Wilkie's, Kirkwood's, Lord Ducie's, and his own, pointing out the advantages and disadvantages in working them. One harrow, said to be invented by Smith, of Deanston, and improved by himself, by serrating the discs (a sort of quoit-shaped instrument), attracted considerable attention. It was shown by the Dynamometer, that so great an improvement had been made in English ploughs, that they were now superior to the Scotch, by taking less draught, as 32 to 40. Mr. Cottam concluded by showing the great importance of every improvement in Agriculture. The importance of any improvement in Agriculture will be easily comprehended by the following calculation:—The extent of land under Wheat in the United Kingdom is about 8,000,000 of acres, and the average produce about 24 bushels per acre. Now if this average could only be increased to 27 bushels, this would yield 3,000,000 of quarters, which at the present price, say 50*s.*, would amount to the sum of 7,500,000*l.* It is not only in the Wheat-crop that an increase could be obtained by the new system of thorough draining and subsoil-ploughing, but all other crops; and the quantity of food for stock of all descriptions would be increased thereby.

ON INFLAMMATORY FEVER IN YOUNG CATTLE.

Inflammatory fever or quarter-evil, or, as it is also sometimes termed, black-leg, is one of the most fatal diseases to which cattle are subject, being exceedingly rapid in its progress, and seldom admitting of cure; never, indeed, unless the remedial measures are actively adopted at an early stage of the disease. Young cattle chiefly are its victims, and so rapid is its progress, that on being looked over in the morning the animals may appear as usual, and before evening one or more of them may be suffering from inflammatory fever, which may even have proceeded so far that decomposition has commenced in the part affected, after which a cure is hopeless. The farmer can never place much confidence in the success even of the best treatment for the cure of this disease; but he has much more influence in preventing its ravages than is usually supposed.

Inflammatory fever is now fortunately a disease of much rarer occurrence than formerly. In many cases I have known the rearing of calves altogether abandoned from the prevalence of this disease, and the probability of their being carried off by it before completing their second year. What appeared more surprising still, the animals making greatest proficiency in their growth were invariably those most liable to suffer. In other districts, however, it is comparatively unknown, especially where a uniform system of treatment is adopted in the feeding of the animals. A knowledge of the animal economy is of scarcely less importance to the farmer than that of the best systems of cropping, as his live-stock constitute the largest portion of his capital, and such knowledge would often save him from serious loss. It would show him that the disease to which we are now referring was the natural consequence of his violation of the laws of Nature in the treatment of his young cattle, and the penalty which he must pay for his defective management. His young cattle at one time are so miserably fed as merely to support life, and at another fed highly, the change in the quality of food being also effected in a short space of time. That this should produce a derangement of the system cannot appear surprising. In districts where Turnip cultivation is little practised, the young cattle are supported during the winter on straw, and that often of an inferior quality, from being improperly saved, with a run for a few hours each day over their miserable pastures; and so far have the animals been reduced during the winter by this treatment, that the first few weeks of the spring, after vegetation has made some progress, and the grass affords a full bite, produces such an effect on them that inflammatory fever seizes them and speedily carries them off. Those making most progress at the time are also most likely to become the victims of the disease, the reason for which is obvious. Though occasionally occurring at different periods of the season, yet nine-tenths of the cases of the disease which occur take place in the spring or beginning of summer, as at no other period does the system undergo such a change from a transition in the quality of food.

Though little can be done in the way of cure, yet it will

appear much may be effected by prevention. The more general cultivation of green crops to supply the cattle during winter with food, not merely to keep them alive, but also to promote their growth, will do much to render the devastations of this disease less formidable, or prevent its occurrence altogether. Many cases have come under my own observation in which this has, in a great degree, been effected by such means. I may mention one particular case, in which the rearing of young cattle was altogether given up, from the calamity of the young animals being carried off by inflammatory fever; but since the growth of Turnips was introduced on the farm five or six years ago, the farmer in question has again commenced rearing his calves, and the young animals being supplied plentifully with Turnips throughout the winter, not a single case of the disease has since occurred.

The advantage of early maturity in the rearing of live stock is now generally understood, and it is not a little singular that more effective means are not more generally employed to attain such a very desirable object. The farmer who does not maintain his young stock in a condition of progressive improvement from their birth until they are disposed of, very much neglects his own interests. It will not do to allow them to stand still, much less to retrograde in condition, at one period of the season, with the idea of making up the loss at another. This is false economy, to say the least of it; but it further subjects the unfortunate animals to disease, and that of the most active kind.

It is not my present purpose to enter into the treatment of inflammatory fever after it has made its appearance, as this must be reserved for another occasion. The foregoing remarks on the subject have been suggested by the perusal of the prospectus of an Association for Assuring the Farmer from Loss by the death of his Live Stock; but an exception is made in the case of the disease under notice. This exception would seem to indicate that the number of cases of inflammatory fever must still be great, otherwise, the conclusion of the Association has been arrived at on incorrect data. Though, as before remarked, the farmer can do little in the way of cure, he can do much in preventing the disease from at all making its appearance among his stock; therefore, the so general prevalence of this disease seems a reproach to the good sense of the farming community.—*J. Sproule.*

Home Correspondence.

Irrigation.—Liquid manure, and the waste of various drainings are the subject of frequent speaking and writing. Applications of this nature to land are usually effected by cartage. There is, however, another mode of applying liquid manure, which is seldom adverted to, and that is by irrigation. When once the land to be irrigated is formed for the purpose of receiving superficial water, the whole quantity of disposable water may be applied at a comparatively inconsiderable expense. The quality of water is a subject deserving much attention, where it flows from springs only, and in dry weather. In rainy weather, and in a cultivated country, most watercourses necessarily contain much fertilising matter, either in a solid state, or in solution, in addition to that which rain itself contains. Even in dry weather, where a stream is of considerable size, it usually receives some additions to the original springs which feed it, from various outlets in farm-yards and domestic buildings. There are, therefore, at least three conditions of running water. The first is its original quality as it comes out of the earth; in this state the temperature of the water is of great importance in its influence on vegetation. It is, perhaps, to this cause that the water issuing out of calcareous strata, such as chalk, produces in the winter months the continual growth of Grass, which would otherwise be torpid. It is true, these waters contain much carbonic acid gas; but even this, it is presumed, would scarcely affect vegetation in a temperature equivalent to the low mean temperature of the air; and thus water at a distance from the source, is said to lose much of its fertilising power. It cannot, however, be supposed that water, in running briskly along, exposed to the atmosphere, will lose much of its useful quality, otherwise than by its loss of heat; and this loss would not continue after the mean temperature of the air becomes greater than that of the earth, viz., between March and November. This agrees with what is observed in irrigated meadows: there is comparatively little growth in the winter months; but where the temperature of the air, and, consequently, the water, is greater as the spring advances, then vegetation proceeds with much activity. A long-continued irrigation in warm weather, however, produces unfavourable changes in the growing Grass, attended with an appearance of white scum, which dries of a leathery consistence. Perhaps some of your correspondents may be enabled scientifically to explain the nature of this substance. It is, however, very desirable that some more certain practicable mode of watering land should be made known. One person likes to water much, and another likes to water little. There is but one point upon which all good irrigators agree, and that is to keep the land thoroughly dry when it is not watered. But as to how long to keep it dry, and how long to water at a time, although questions material enough to be solved, no answer can be obtained. The second condition of running water is that which contains the washings and scourings of the soil through which it passes in rainy weather, commonly called land-floods. There can be no doubt of its good effects, nor that with reference only to this use of water, the irrigation should cease with the floods. The third condition which has been adverted to, partakes of both the former states of running water; it is that of a stream which in dry weather contains much adventitious matter. This water is, therefore, in relation to the more permanent nature of its constituents, nearly allied to the water of warm or calcareous springs, as containing the elements of vegetable life. Its application must depend on the previous questions being satisfactorily answered with regard to the proper mode, and intervals of application. Liebig, in his "Agricultural Chemistry," (page 159), refers to the very superior management and great produce of water-meadows in Nassau. He says the land is irrigated both in spring and in autumn, but no mention is made of winter-watering. One other remark should be made, and that is on the pernicious quality of some waters which have long continued stagnant, or which contain in solution the contents of metallic strata unfriendly to the growth of useful Grasses. There are, however, some waters which appear on analysis pure, and yet no good effect is produced by them. If these observations should obtain the notice of any of your more intelligent correspondents, it is hoped that some light will be thrown on this somewhat obscure subject.—*T. P.*

[With regard to the 2d description of streams alluded to above, it may be mentioned that most water-courses are affected by the causes there alluded to; and care should be taken not to avail one's self of the first autumn floods for the purpose of irrigation, as they contain the washing of ditches and waste places, and are generally loaded with the seeds of weeds.]

Lucerne.—As you have inserted the remarks of "Nicodemus" on the concluding paragraph of an article sent to the *Agricultural Gazette* by the Secretary of the Chepstow Farmers' Club, and as there is no probability that either of the gentlemen mentioned by him will take the trouble of replying to his uncourteous attack, made under an assumed name, I hope you will also insert these few observations addressed to "Nicodemus" on the subject. I allow that I am not sufficiently conversant with Agricultural matters to give such a decided opinion as "Nicodemus" has hazarded. That gentleman would have acted in a more praiseworthy manner, had he stated the extent of his own experience in the growth of Lucerne, both drilled and broadcast; the number of years he has grown it; the nature of the soil and subsoil; together with the situation and aspect of the land on which the crops were produced, with their weight on both plans; and then, without giving two gentlemen credit for wishing to mislead others, he ought modestly to have pointed out the superiority of the one he recommended, and to have inquired whether they had well-grounded experience to confute his arguments. Knowing the liability of men, though able and experienced, to form erroneous opinions, I will concede the point in dispute, though incapable of deciding the question, and suppose Mr. John Sandford and Mr. A. Hall are wrong in giving the preference to sowing Lucerne broadcast; still it is clear that they have only stated their own opinion, and that with moderation, founded on such knowledge as they have been able to acquire, and that they are both open to conviction, and ready to confess their error, when it is clearly proved that they advocate a wrong system.—*Nathaniel.*

Field Beet.—In several articles in your Paper reference has lately been made to the growth of Mangold Wurzel for milch cows; and as I can speak on the subject from my own experience, after growing it for several years, you will perhaps permit me to caution your readers against using it, if their object is quality in their milk, and not quantity. I have invariably found that it increases the measure of milk, but diminishes, to a great extent, the thickness of cream and weight of butter; whereas the use of Carrots or Parsnips keeps up the quantity of milk, and considerably increases the weight of butter. Perhaps this statement may induce others to communicate the result of their experience on the subject.—*A Cow Fancier.*

Chinese Agriculture.—[Notice of the Wheat tillage of China, communicated by John Smith, Esq., surgeon of H.M.S. Cambrian, coast of China.]—"Wheat is cultivated nearly throughout the whole of China; hence the difference in the time of planting, and its coming to maturity. In the southern provinces it is sown in November, as soon as the Rice crops or vegetables have been cleared away; and in the northern it is planted towards the end of October. In the former the harvest commences in April, and in the latter in May; in the Shantong and Chensi provinces it is not finished before the end of July; so that it requires above half a year to come to maturity. It is cultivated on almost every kind of soil, and on the slopes of the mountains, which are cut into terraces for the purpose. In the neighbourhood of Amoy (lat. 24° 25′) it is planted in the marshy grounds from which the rice crop has been removed; and the mean temperature of the months of January and February, 1843 (which were very wet) was about 56° of Fahrenheit. The coast about Amoy is extremely barren and unproductive, the soil being chiefly composed of disintegrated sand-stone, and the detritus of granite, naturally producing nothing but mosses, and a few stunted Pines and Laurels; by the industry of the Chinese, and the copious application of human manure, it is made highly productive; and cultivation is carried on to the very summit of hills 1000 and 1200 feet high, the slopes of which are formed into terraces, to prevent the soil from being washed away by the rains. Smut appears to be the only disease to which the Wheat is subject. Everything in the shape of a weed is most carefully removed, and the utmost attention paid to prevent any noxious influence from injuring the crop. The land is prepared in the ordinary manner when the autumnal rains have fully soaked it. Having been ploughed in a very loose manner, the clods are divided by a harrow, the pins of which have a cutting edge, which is drawn by a small ox, after which it is formed into deep and broad furrows, with intervening ridges for the reception of the plants, which, having been raised in nursery beds, are transplanted when about five inches high in bunches on the long ridges, so as to occupy only one half of the ground. In each bunch of the transplanted Wheat which I picked here (at Chusan) there were 29 plants or stalks; and a square yard contains 15 such bunches planted at equal distances. I examined 15 heads (ears) one from each stalk of the bunch, in their perfectly ripened state, and found them to contain as follows, 33, 45, 34, 49, 34, 40, 42, 32, 48, 45, 31, 33, 38, 34, and 44 grains each, giving an average produce of 38.8 per ear. An ounce avoirdupois contains 1067 grains (this gives 48.771333 to the apothecary's scruple, or 146.3213 to the drachm). The process of tillage is rather tedious, and the expense of ground considerable; but in return for this, the Wheat takes deep root, and is well nourished. The manure employed in some places is the cake left after expressing the oil from Mustard seed, human and other hair, lime from burned shells; but human fœces and urine constitute the prevailing manure, and are so highly valued that they are carefully preserved by every family, and sold at a high price. To such an extent is the economy of this manure carried, that, to prevent any possible waste, privies are everywhere provided in the towns, and those who have occasion for them, not only invited to enter, but paid for so doing with a small piece of money. All these several substances, with a vegetable expressly cultivated for the purpose, straw and weeds, are thrown into vats, of which several are placed for security at the door of every house, and left to ferment till required. Wheat is called by the Chinese "Syiy Nia," and Barley "Drow Nia," or "the poor man's grain;" the former being called, when speaking to us, "mandarin chow," chow or food. The latitude here (at Chusan) is 30° 0′ 20″, at Amoy 24° 25′ 0″; but the cold is both longer and more severe here than at Amoy during the season of Wheat. There is a Wheat here without a beard, a specimen of which I have. It is cultivated in the same manner as the other. The average weight of each ear in an undried state is 15 grains. Great attention is paid to the manuring and irrigation if the season happen to be dry. During the winter the Wheat remains very low, and no further attention is paid to it by the husbandman. In April and May the growth is extremely rapid; but the Chinese do not allow the crop to attain perfect maturity before they cut it, lest the grain should fall out. When cut it is left to dry, and the grain is then beaten out in a tub." Thinking it possible that the accompanying notice of the Wheat tillage of China might serve to amuse, if not to instruct the readers of the *Chronicle*, I send it to you, accompanied by one scruple of the Chinese Wheat, and the same quantity of Barley. The former is, I believe, the same with that described by my friend Prof. Desvaux, in his valuable "Mémoire sur les Froments cultivés en France, ou qu'on peut y cultiver," inserted in the first volume of the "Mémoires de la Société d'Agriculture, Science, et Arts d'Angers," page 347, under the name of "*F. barbu de la Chine*," (Triticum sativum Sinense); his account of which, however, is not very encouraging, as he says,—"This variety has never succeeded well; it is short," &c. In point of hardihood it is inferior to the Mummy Wheat of Mr. Tupper, of which I have three plants which have stood out all the winter without protection, in a pot outside my bed-room window; while the Chinese Wheat and Barley perished under similar circumstances, and I have only two or three plants left, which I sowed later and covered with a tumbler. However, it may answer as a spring variety, and admit of improvement by careful culture. I find 49 or 50 grains required to counterpoise a scruple. The Barley is six rowed, and an ear which I have is beautiful. The length of the ear, including the awns, is 5 inches, exclusive of them 3½ inches, and each row contains 10 grains, giving 60 for the whole of the six rows; about 35 grains weigh a scruple. I have, however, in each case picked out the plumpest and largest grains. A Norfolk farmer will be amused at the Chinese method of thrashing in a tub; but, notwithstanding, some parts of the Chinese Agriculture may suggest useful hints, some for a Norfolk or a Lothian farmer; especially the attention paid to the eradication of weeds, and the value set upon human manure, which contains more nitrogen than any other. The offensive odour of this, which forms I believe its chief objection, may be corrected by the addition of powdered gypsum or other substances, which, by preventing the loss of ammonia as it arises from the decomposing mass, destroy the fœtor, and add to the value of the manure.—*William Hamilton, Plymouth.*

Pig Feeding.—Having for some years been a practical amateur feeder of pigs, and somewhat celebrated among my friends for my bacon, I willingly send you the result of my practice, together with the very simple mode which I adopt. First, as to the choice of sort, the description given by your correspondent "J. Steele" is not far from the mark; avoid large flapping ears, a long snout, and coarse hair. A long deep-bodied pig is most likely to fill up well at both ends. Purchase your stock for winter feeding about July; let them have the run of the wash-tub, refuse vegetables, and let them graze as much as you can afford. Let their sty be warm, thoroughly clean, and well ventilated, littered down regularly once a week, and well drained. If you brew, let them have the grains, but only whilst fresh. About the first week in October begin the process of fattening. First, on putting your pigs into the stye for good, wash them all with a good strong scrubbing-brush and soap and water; it relieves the hide generally, and tends much to their comfort. For their food, mix in a bucket only as much good fresh Barley-meal as your pigs (say three) will eat without leaving any—the meal to have just as much water, and that soft and cold, as will cause the meal to adhere stiffly together, so that the pigs eat it and do not lap it up. Let your feeding-trough have a high back, so that there be no waste of food,

and let it be too heavy to be overturned. In the corner of the sty have a trough (a stone one is best, as least likely to be upset) filled every day with clean water, of which the pigs will partake with much relish; they will then lie down and sleep, a process greatly conducive to fattening. Give them their food about four or five times a day, as fresh as you can mix it, and only what they can consume at a meal. Let them out once or twice a week for an hour during the first month; occasionally give them a pound or two of coal-dust, which they eat greedily, and which certainly has some good effect on them. The second month give them every other day a peck of *chat* Potatoes, boiled or steamed, mixed with the Barley-meal; and the last fortnight, instead of the Potatoes, give them every other day about a gallon of Peas each; this will make the fat firm. In thus fattening three pigs, the third should pay or nearly so for the other two. The following is the expense attending this mode of feeding:—

Three pigs of about 10 stone each, 12 lbs. to the stone, 2*l.* 6*s.*	£6 18*s.*
Barley-meal, 12 cwt., at 8*s.* per cwt.	4 16
Peas, 3 bushels, at 5*s.* per bushel	0 15
Potatoes, wash, &c.	0 5
	£12 15

Or 4*l.* 5*s.* per pig. The whole merit lies in never allowing the pigs to have more than they can comfortably eat at a meal, and their sleeping in a clean and warm sty during the progress of digestion.—*W. H. Hill, Pembridge, Herefordshire.*

Rooks.—I have been an attentive observer of animals and birds for many years, and I have in vain attempted to fix on the rook the character of a rogue in grain. I believe him to be grossly libelled when accused of eating grain; the question, I conceive, has been long decided by naturalists, that he is a feeder on worms, grubs, larvæ, &c. The mischief he does is this,—in grubbing up the ground newly sowed he stacks up the grain, and the larks and small birds take it away. A corn may occasionally adhere to a good fat grub, and such may have been detected in his unfortunate maw; but that he is a purloiner of grain I deny.—*W. H. Hill.*

Inland Railways and Agricultural Improvement.—To enable the Agriculturist to commence, and to avail himself of modern improvements, we know of nothing so necessary as a ready and cheap mode of transit. This is necessary for the advantageous disposal of his surplusage. Railway communication is the desideratum through the inland part of the country. Lut us suppose a case, and how it is practicable to be made available, by an apparent sacrifice on the part of the landowners, and on the part of Government. Take the contemplated line from Carlisle to Edinburgh and Glasgow. This would open up a fine and productive country between the Atlantic and German Oceans, where there is at present no water conveyance. We shall admit that this line at first, for the sake of argument, could not support itself, or make any adequate return, so as to induce a company to undertake it. Well; the proprietors all along the line are to be especially benefited; and we shall suppose, in the first place, they agree to give a grant of the necessary ground excepting near Edinburgh and Glasgow, where it is very valuable, and very small properties. This would be a stimulant to the undertaking; and if, in addition, and on the abovementioned condition, Government could be induced to advance 25 per cent. of the then expense of the construction of the railway, on the security of the railway—*secundo loco* to the shareholders, who were to receive only a certain per centage upon their money—say 4 or 5 per cent.—we should soon see a railway between Carlisle and Edinburgh, and also between the former and Glasgow. The proprietors of the ground would be benefited by giving away, and the nation would be benefited by the advance made by Government, in so far as it would give employment. A right in reversion could be stipulated for in favour of the landowners, after ample provision was made for all contingencies, by a sinking fund or otherwise; and also a preference to proprietors who had supplied ground on the terms before mentioned, to take shares up to a certain period, and then to be open to the public; or these suggestions, or any of them, may be subject to modification. It may be said that entailed lands could not be alienated or given away; but the same Act of Parliament that authorised the formation of the line, could empower the necessary conveyance by the heir in possession, or otherwise provide for this, on the ground that it was beneficial to the estate, and consequently beneficial to heirs of entail. As this suggestion may appear to some Utopian, we may mention that Lord Panmure gave the necessary ground for the railway between Dundee and Arbroath, in so far as it passed through his entailed property, and he holds his estate under a very strict entail. Government gave 20,000,000*l.* for bettering the condition of the blacks. If it would give half this sum, or 10,000,000*l.*, to construct railways, it would not only better our condition, but would, in due time, receive a return for the advance.—*Amicus Humanitatus.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A MONTHLY Council was held, at the Society's House, on Wednesday last; present: the Right Hon. Earl Spencer, President, in the chair; Hon. Captain Spencer, Hon. R. H. Clive, M.P., T. R. Barker, Esq., S. Bennett, Esq., T. W. Bramston, Esq., M.P., W. R. Browne, Esq., E. Buller, Esq., M.P., F. Burke, Esq., H. Colman, Esq., F. C. Cherry, Esq., E. D. Davenport, Esq., H. Gibbs, Esq., B. Gibbs, Esq., S. Grantham, Esq., W. G. Hayter, Esq., M.P., W. F. Hobbs, Esq., J. Hudson, Esq., Sir John V. B. Johnstone, Bart., M.P., Samuel Jonas, Esq., Rev. C. E. Keene, G. Kimberley, Esq., J. Kinder, Esq., Sir Francis Lawley, Bart., W. Miles, Esq., M.P., P. Pusey, Esq., M.P., F. Pym, Esq., Professor Sewell, W. Shaw, Esq., J. V. Shelley, Esq., and C. Stokes, Esq.—The following gentlemen were elected Members:—

Chalcraft, William, Bramshot House, Liphook, Hants.
Wheable, Thomas, Mitchelmersh, Romsey, Hants.
Lindley, Urban, Radmanthwaite House, Mansfield, Notts.
Pitfield, John, Symondsbury, Bridport, Dorset.
Mathias, William, Lambert, Fishguard, Pembrokeshire.
Robbins, Col. T. W., Castle-Malwood, Stoney-Cross, Hants.
Stacey, George, Uxbridge, Middlesex.
Black, John, Marske, Guisborough, Yorkshire.
Rawlence, James, Heale, Woodford, near Salisbury.
Porquet, M. F. de, Iron Foundry, Hornchurch, Romford, Essex.
Pocock, Henry, Sowley, Beaulieu, near Southampton.
Martin, William, Paul's Grove, near Portsmouth.
Fifield, Job, Hill Park, Romsey, Hants.
Tichborne, Sir Henry, Bart., Tichborne, Alresford, Hants.
Plenty, Edward, Newbury, Berkshire.

The names of 16 candidates for election at the next meeting were then read.

FINANCES.—Mr. Raymond Barker, chairman of the Finance Committee, presented the monthly Report of the state of the funds of the Society; from which it appeared, that the invested capital amounted to 7,700*l.*, and the current cash balance on the 31st March, to 1,742*l.*

DISCRIMINATION OF SOILS.—Mr. Pusey, M.P., Chairman of the Journal Committee, reported the adjudication of the Society's Prize of 50*l.* for the best Essay "On the Indications which are practical guides in judging of the Fertility or Barrenness of Soils," to Mr. John Bravender, Land-Surveyor, Cirencester, Gloucestershire. Many attempts having been made to explain the productiveness of the soil by chemical or physical causes, without any decided result, it appeared desirable to the Society, in selecting this subject for one of their Prizes, that the researches of Natural Philosophy should be assisted by making them acquainted with those obvious signs, whether of colour, consistence, or vegetation, by which surveyors and farmers are enabled to give at once a practical opinion upon the probable nature of land which they inspect. Mr. Pusey further reported that the Judges had highly commended four of the remaining Essays in that class, namely, those bearing respectively the following mottoes:—"Truth needs no embellishment," "H. A. P." "Then cold and hot, and moist and dry, In order to their stations leap," and "Speed the Plough;" and the writers were requested accordingly to communicate their names to the Secretary. He felt much satisfaction in communicating to the Council the great improvement this year in all the Essays sent in to compete for the various subjects of the Society's prizes. The Essays were not only more numerous, but more clearly expressed, and, above all, of a more practical character. They were working better and better every year; a result highly gratifying to the Journal Committee, as indicative of the great interest taken by the members of the Society in advancing its important objects.

PROGNOSTICS OF WEATHER.—In reference to the prize of the Society's gold medal, for the best account or record of the prognostics or natural signs of changes in the weather, Mr. Pusey reported that the two Essays selected by the judges in 1842 for a twelvemonth's trial of the practical value of the rules they respectively contained, had been placed, as recommended by the Council, in the hands of Mr. J. C. Morton, of the Whitfield Example Farm, for that purpose; and Mr. Morton had informed him of the completion of the trial on a very extensive scale of observation; the results, however, being too numerous to admit of immediate reduction to a common standard of comparison. On the motion of Mr. Pusey, the Council resolved, that their best thanks should be given to Mr. Morton, and to each of those gentlemen who had so kindly undertaken to assist him in carrying out the objects of the Society in this inquiry.

ESSAYS FOR 1845.—Mr. Pusey laid before the Council the schedule of the subjects and amount of prizes proposed by the Journal Committee for the Essays of next year, viz.:—

10*l.*—On the advantages of One-horse Carts.
10*l.*—On the best method of Fattening Cattle.
20*l.*—On the best method of Reclaiming Heath-land.
50*l.*—On the Agriculture of Nottinghamshire.
50*l.*—On the Agriculture of Cornwall.
50*l.*—On the Agriculture of Kent.
20*l.*—On the cheapest mode of Establishing a Tile-yard.
20*l.*—On Catch Meadows.
50*l.*—On the Dutch method of Curing Butter.
20*l.*—On Fences.
20*l.*—For the best Experiment in Agriculture.

The special conditions annexed to each of the prizes, in reference to the general mode of treating the subject, and the distinct information required to be given on particular points, would be announced in the Appendix of the ensuing Part of the Society's Journal; the Essays themselves being required to be sent to the Secretary on or before the 1st of March, 1845.

(To be continued).

FARMERS' CLUBS.

Stirling.—On March 8 a lecture was delivered in the Court-house, by Prof. Johnston, On Soils and Specific Manures. Among other important statements made by the lecturer, we were informed how draining the soil and sheltering it will greatly increase the warmth of the earth, which will produce earlier crops, and cattle will require less food than they would do if they were in bleak situations. A farmer, to whom I afterwards spoke on this subject, believed such statements were quite true, and he added that cattle have a desire for bottom heat and sought for it. His cows, when they were feeding in a certain field where they required to be out all night, knew where the warmest part was, and came nightly to it; the field was well drained, but the most of it was a clayey bottom, and it was not to the hedge sides and hollows that the cows came at night, but to the most elevated part of the field; and that part was of a gravelly nature. The observation of the farmer and statement of the Professor, thus appears to harmonise. The Professor stated that the heat in the case of the dry soil entered and warmed it; in the moist soil, the heat was employed in evaporating moisture, and consequently keeping it cool.—*Peter Mackenzie.*

Inverness.—At the Annual General Meeting of this Society, the question, "What are the varieties of Oats best suited to the agricultural districts of Inverness-shire, and at what stages of ripening should the crops be reaped?" was discussed; and it was the general opinion, as summed up by the Chairman, that the Hoptoun and Sandy Oats are at present the varieties most in repute in this county—the former for the heavier and the latter for the lighter soils; that the Sandy Oat is superseding almost all the old varieties; and that recently the Hoptoun is, in its localities, giving way rather to the late Angus. Dr. Mackenzie, Kinellan, stated that, for some years back, he has almost exclusively reared the black Tartarian Oat, as one very prolific, much relished by horses, and one which meals well. The meeting was unanimously of opinion that the Oat crops should be cut about ten days before being fully ripe, not only to avoid the risk of shaking, and injury from wind and rain, but also because, when the grain is once fully perfected, the energy of the plant, instead of being thenceforward directed to the secretion of more farina, goes only to the protection of the seed, by increasing the thickness and toughness of the husk.—*Inverness Herald.*

Chepstow.—At the meeting on the 25th of March, the Member who was to bring forward a subject for discussion being unavoidably absent on business, Mr. T. Pride spoke on the best manner of draining land. He considered draining to be a matter of the first importance, and whoever delayed the process on land that required it was not only incurring a serious annual loss himself, but neglecting the performance of his duty to the community. He was convinced that it was only by long experience and closely observing the nature of the land to be operated upon, that any one would be competent, in the case of land wet owing to springs, to decide on the most effectual and economical method of removing the superfluous water. He confined his remarks to land that required parallel or thorough-draining, and gave his opinion of the best manner of effecting this desirable end. In the first place he was decidedly in favour of running the drains right up and down the fall, instead of what was called oblique or diagonal draining. He considered that the deposit from the water was much more likely to lodge in oblique drains, and consequently made them liable to stop the water and send it to the surface again. Where they were to be obtained he preferred stones to anything else for forming the drains. He used flattish stones at first, which are put in edgeways so as to form a channel for the water in the form of a triangle, with its base at the bottom, and then had the drains carefully filled up with broken stones, about two inches in diameter, to within twelve inches of the surface. He was laying his drains 18 to 20 feet apart, but in very stiff land he should not put them more than 15. He was now draining some land, 30 inches deep, on a small farm he had taken into his own hands expressly for that purpose, and in cutting the drains he found stones enough for the purpose. He paid 9*d.* for seven yards of drain, including cutting and filling; if the stones had to be carted of course it would cost him more, but at present this was the whole of the expense. He should recommend the drains to be from 30 inches to three feet deep; never less than the former. Mr. T. Perkins said he preferred diagonal draining, taking the main drain up the middle of the fall, and bringing the cross drains obliquely into it. He drained a piece of land with the fall eleven years ago, but did not find the remedy effectual. He had now cut other drains across, and completely dried the ground. He found all the drains open and running when they were cut through, but the land was not thoroughly drained by them. The first drains were only 20 inches deep, the others from two feet six inches to three feet. The system he followed was tile-draining.—A member stated that increasing the depth most probably caused the difference; and, had the first drains been deeper, he thought those across would have been unnecessary.—Mr. W. Baker said he once tried cross draining, which did not answer, but finding some benefit from the main drain, which went straight up the field, he put some more parallel with it and drained the piece of land effectually. He considered that draining with the fall was decidedly best.

In the course of a subsequent conversation on another subject, Mr. D. Baker said he intended to sow some cow Grass instead of red Clover, which a member advised him not to do on his land, because it was a shallow soil at a considerable elevation. He found it required good deep land to grow it to advantage, and then the produce was nearly equal to that of broad Clover, and the stem being solid, it did not cause hoven in cattle. He had tried it repeatedly on a shallow soil with very poor success.—*A. Hall, Hon. Sec.*

Reviews.

An Essay on the Growth and Management of Flax in Ireland, which obtained the Gold Medal of the Royal Dublin Society. By John Sproule, Author of a "Treatise of Agriculture." S. T. Machen, Westmoreland-street, Dublin.

WE have to direct the attention of our readers, in this day's Paper, to the first of a series of articles by Mr. Sproule, on Flax Culture; and we have great satisfaction

in doing so, after reading the pamphlet entitled above, for its author is evidently well qualified to teach upon that subject. It is a valuable practical treatise on the cultivation and manufacture of Flax, and enters most fully into detail on every necessary point.

Miscellaneous.

Adulteration of Manures. — Three different specimens of nitrate of soda, sold at 25*s.* per cwt., were submitted to analysis, when they were found to contain respectively 14, 25, and 26 per cent. of common salt! Now these specimens were purchased from extensive dealers in the article, and were contained in the bags in which it was imported, so that we have no reason for suspecting the honesty of the retailer; and it follows, therefore, that this shameful amount of adulteration must be effected prior to its being shipped for Britain. I would desire that you bear in mind, however, the fact, that the presence of common salt, even to this enormous extent, may be natural; but yet the imposition upon the British farmer is equally glaring, whichever be the case, as will be seen by the following statement regarding saltpetre. This article likewise contains common salt, though in much smaller quantities; but, in this instance, the fact is not attempted to be concealed. Every cargo is analysed at the India House before it is sold, and the per centage of salt marked upon it, and the amount of salt deducted from the lot purchased. For example, suppose the saltpetre contained 10 per cent. of salt, if a purchaser buys 100 cwt., he receives the 100, but only pays for 90. Here, therefore, there is no deception; but we would ask how it happens that the same is not done with nitrate of soda, and that three specimens containing from 14 to 26 per cent. of salt should all be sold at one and the same price? Why, if justice were done in this case, the specimen containing 26 per cent. should have sold at 22*s.* in place of 25*s.*, if that be the fair price for the lot containing 14 per cent.; and if, on the contrary, 25*s.* is the proper price for the pure article, these three lots should have sold respectively at 21*s.* 6*d.*, 18*s.* 9*d.*, and 18*s.* 6*d.* per cwt.*—*Dr. Madden, on the Advantages of Extended Chemical Analysis to Agriculture.*

Caution to Farmers.—On Thursday a lot of one and two-year old cattle belonging to Mr. Dumbell, 14 in number, were suddenly seized with illness while grazing in the meadow belonging to the Hills estate, situate at the foot of Lazy-hill, near this town (Douglas, Isle of Man), and in a few hours three of them died. Mr. T. Alston, an experienced farrier, was sent for with haste. On his arrival he instantly set about ascertaining the cause of sickness and consequent death. This he discovered by opening and examining the stomachs of the cattle that had first died, each of which was found to contain a quantity of the roots of common Hemlock. To save the 11 other animals, he immediately bled them, and administered pounded chalk and other ingredients in warm milk; and we are happy to say that he saved the whole of the remainder, 11 in number. It appears that the cause of the Hemlock roots coming within the reach of the animals originated in the drains throughout the meadow having lately been opened; and in turning up the earth, large quantities of the roots of this deadly poison, which abound in great quantities in one of the ditches, had been dug up, and thrown upon the surface. This should operate as a caution to farmers not to turn cattle into boggy pastures while the operation of clearing drains is being performed, as in such situations the presence of this poisonous root may almost always be suspected. — *Mona's Herald.*

Urate.—If the floors of stables or cow-sheds were strewed with common gypsum, they would lose all their offensive and injurious smell, and none of the Ammonia which forms could be lost, but would be retained in a condition serviceable as manure. This composition, swept from the stable-floor, nearly constitutes what is sold under the denomination of Urate. Manufacturers of this material state, that three or four cwt. of Urate form sufficient manure for an acre: a far more promising adventure for a practical farmer will be to go to some expense in saving his own liquid manure, and, after mixing it with burnt gypsum, to lay it abundantly upon his Corn-lands. For, in this way, he may use as much gypsum as will absorb the whole of the urine. Now, in the manufacture of Urate, the proportion of 10 lbs. is employed to every 7 gallons,—allowing the mixture, occasionally stirred, to stand some time pouring off the liquid, and with it nearly all its saline contents except the Ammonia. Urate, therefore, can never present all the virtues of the urine—100 lbs. of Urate containing no greater weight of saline and organic matter than 10 gallons of urine.—*Smith's Productive Farming.*

Indian Wheat.—The Wheat Committee of the Agricultural Society have reported that the question is one of the highest importance as affecting the interests of India, and recommend the Society to nominate a committee for the purpose of preparing memorials to the Board of Control and Court of Directors, urging the admission of corresponding advantage to grain from this country, as has already been conceded to that from Canada.—*Indian Mail.*

* Messrs. Mark Fothergill and Co., London, who deal extensively in nitrate of soda, inform me that they examine what they buy, and reject as "useless stuff" any specimen containing above 13 per cent.

Notices to Correspondents.

Bailey.—*W. P. T.*—It was advertised by Mr. Robt. Beman, of Donnington, near Stow, Gloucestershire.

Bokhara Clover.—*A. R. C.*—We have not seen it in any stage of its growth in which it could be useful for cattle. When very young it is a succulent plant, but it soon becomes woody.

Concrete Tiles.—*Subscriber.*—We do not know any work wholly on this subject; but you will find details connected with it in the Number of the "Farmers' Magazine" for August, 1842, and in the July Number of Stephens's "Book of the Farm" for that year.

Dibbling Swedes.—*W. P.* informs "W. S." that the method of transplanting Swedes which he recommends, was heartily recommended and fully detailed by the late William Cobbett, in his "Journal of a Year's Residence in the United States." Does "W. S." know whether Carrots, Beet, and Parsnips can be transplanted with success?

Drainage.—*T. T. Hawley.*—We have received none of the letters you refer to; and if you will favour us with their contents, they shall, as all applications do, receive our immediate attention.

Food of Plants.—*Rural Chemist.*—See Leading Article next week.

Gas-Water.—*Gorgn.*—It appears from your statement, that about equal weights of the gas liquor and sulphuric acid neutralise each other. If you are right, the liquor must be of extraordinary strength; every gallon must contain about 3 lbs. of ammonia. If you use 20 cubic yards of your compost per acre, put to every cubic yard of it one gallon of the neutralised liquor. You will thus apply 1¾ cwt. of sulphate of ammonia per acre.

Grass.—*J. B. H.*—Your sheep-fed Grass land, other things being equal, is more likely to yield Hay than one that has been mown frequently. Potter's guano had better be applied in mixture with vegetable earth on Grass lands: you will thus be able to spread it more equally.

Guano.—*J. M'I.*—Guano is a good manure for land *out* of condition, whatever be the crop to be grown. It will be a useful manure for Flax.

Mortality among Cattle.—*ω.*—We shall endeavour to meet your wish in the course of a Number or two.

Neapolitan Pigs.—*A. H.* is informed that Mr. France, of Hamhill, Worcester, has a herd of the pure breed.

Pigeon Dung.—*ὁμονοιώς.*—Apply it to arable land, and plough it in at the rate of 10 bushels an acre, having first mixed that quantity with about a cart-load of vegetable earth.

Potter's Guano.—*Mudie.*—Drill the land up for Potatoes, and then having sown the guano, at the rate of two or three cwt. per acre, in the rows, mix it well with the earth, by means of a horse-hoe or otherwise, and plant the roots in the earth thus loosened and mixed, and cover up as usual.

Potatoes.—*Argus.*—There is no second-early Potato equal to Prince's Early.—*J. C.*

Salt.—*J. C.* can get from those who manufacture it from *salt springs*—the salt which burns on the pans—at a nominal price. Try 1 cwt. per acre. See Report of Bromsgrove Farmers' Club, next Number.

Salt and Lime.—*Archenfield.*—Dissolve 2 cwt. of salt in 80 gallons of water, and with this slake 20 bushels of quick lime; spread it abroad on a firm floor for a fortnight: it will probably deliquesce. Apply this quantity on an acre; mix it with plenty of mould before applying it on grass-land, and on arable-land plough it well in. Can any one give us their experience of this manure?

Soot and Salt.—*Anon.*—Apply it along the top of the rows before the Potato plants come through.

Superphosphate of Lime.—*A Subscriber.*—Six or eight bushels per acre of bones thus converted have been found equally efficacious with three quarters per acre in the ordinary condition.

Swedes.—*Young Farmer.*—You need not expect a crop on "*cold, wet, marshy*" land. It must be drained first.

Top-dressing for Oats.—*North.*—This depends on the soil. Nitrate of soda, sulphate of ammonia, at one cwt. per acre, or more probably guano at the rate of three cwt. per acre, will answer your purpose.

Top-dressing.—*A. Y.*—Try nitrate of soda, 1 cwt. per acre, applied early in May. See Mr. Lawes's remarks in Leader. The same might be applied beneficially to Tares earlier. For Cow Cabbage next week. Parsnips are a better food than Beet for cows.

Trenching.—*H.*—By all means keep the top soil uppermost.

Whitfield.—*Vale of White Horse.*—Some of the sheep belonging to the Whitfield farm have been kept on other Grass lands the property of Lord Ducie, in the neighbourhood, during the summer. They have been paid for at the rate of 4*d.* and 6*d.* per head per week for tegs and ewes; and, on the other hand, cattle (2 years old and 3 years old oxen) belonging to the Earl of Ducie, have been kept on Whitfield farm during winter and spring, and they have paid for their keep (Swedes, Mangold Wurzel, and Straw) being half in yard and half in house, at the rate of 4*s.* per head per week. If these rates of payment were fair, then the fact that in settling accounts between the two farms there has always hitherto been a balance in favour of Whitfield, shows that a larger amount of stock might have been fed on that farm than was kept there. Mr. Morton's estimate of return from live stock has never yet been put to the test; the plan which he proposed to follow was not adopted, owing to circumstances which it is unnecessary to state here.

Worn-out Land.—*An Old Farmer.*—Farm-yard manure made by sheep or oxen fed on oilcake, roots, and straw, is the best material to apply. If you have not got it, or if haulage would be expensive, apply 3 or 4 cwt. of guano per acre, and mix it well with the soil. You will have to pare and burn the peaty turf; plough the land and harrow it to pieces, then apply the guano and harrow it in; cross plough, harrow repeatedly, roll, &c., and ridge up for Potatoes.

Miscellaneous.—*W. P., Taunton,* informs "A. H." that Mr. Clark, of Trinsbury Farm, near Romsey, Hants, has a herd of pure Neapolitan pigs.——And he informs "P. McKenzie" that "Spar" in Cornwall means Quartz.

*** As usual many communications have been received too late.

Markets.

SMITHFIELD, Monday, April 1.—Per stone of 8 lbs.

	3*s* 6 to 3*s* 10		3*s* 10 to 4*s* 2
Best Scots, Herefords, &c.		Best Downs & Half-breds	
Best Short Horns	3 2 3 6	do. shorn	3 4 3 8
Second quality Beasts	3 10 3 8	Best Long-wools	3 8 4 0
Calves	4 0 4 8	do. shorn	3 0 3 4
Pigs	3 0 3 8	Ewes and second quality	3 0 3 4

Beasts, 2820; Sheep and Lambs, 27,140; Calves, 63; Pigs, 340.

A less demand for Beef and Mutton we do not remember for a very long time than has ruled here to-day; it is greatly to be accounted for by the sudden setting in of warm weather, which invariably has this effect. Having also a considerable supply, the prices have suffered a decline of fully 2*d* per 8 lbs, and a very great many cannot be disposed of at that reduction; towards the close of the day several Beasts were sold at a little under our quotations—still, a very large number remain unsold, of both Beasts and Sheep, especially the latter. A great many of the best Downs did not make more than 4*s*, although some few choice ones made 4*s* 2*d*; and it was difficult to realise 4*s* for the best Longwools. Ewes and plain Sheep were scarcely saleable. The Lamb trade presents an improving aspect, and several small good quality are sold at 7*s* per 8 lbs; large ones at from 5*s* 8*d* to 6*s* 4*d*. Veal is a very heavy trade, and but very few Calves realise our highest quotation. Pigs are also lower.

Friday, April 5.

This being Good Friday, the most interesting feature of to-day's market is the show of Lambs, and the trade in that article. This is considered the first day of the regular trade in Lamb. We have noticed a larger supply in former years; there is, however, sufficient to meet the demand—indeed, a few remain unsold; the very best are worth from 6*s* 8*d* to 7*s* per 8 lbs, and larger ones 5*s* 8*d* to 6*s* 4*d*. In other kinds of stock very little is doing, and in what is sold we cannot notice any difference in price from Monday's quotations.

Beasts, 373; Sheep and Lambs, 6990; Calves, 216; Pigs, 296.

41, West Smithfield.

HOPS, Thursday, April 4.

There is no alteration in the Hop Market since last week.

Mid & East Kent Pocks	8*l* 0*s* to 10*l* 10*s*		Sussex Pockets	6*l*—*s* to 6*l* 8*s*	
Choice ditto	11 0	— —	Choice ditto	6 12	—
Weald of Kent Pocks	6 0	6 15	Farnham	9 9	10 10
Choice ditto	7 0	— —			

Patteridge & Smith, Hop-Factors.

MARK LANE, Thursday, April 4.—Wheat sells at rather lower prices than on Monday. Free Foreign is a slow sale, and scarcely maintains that day's rates. In Bonded there is nothing doing.

BRITISH, PER IMPERIAL QUARTER.	*s.*	*s.*		*s.*	*s.*
Wheat, Essex, Kent, and Suffolk . . White	46	56	Red .	46	56
—— Norfolk, Lincolnshire, and Yorkshire . .	50	57	White .	—	—
Oats, Lincolnshire and Yorkshire . . Polands	15	25	Feed	16	24
—— Northumberland and Scotch . . Feed	—	—	Potato	17	25
—— Irish . . . . . Feed	16	23	Potato	16	24
Barley, Malting and distilling 28*s* to 33*s* Chevalier	32	35	Grind.	24	30
Malt, pale, ship	—	—			
—— Hertford and Essex	—	—

Beans, Mazagan, old and new 22 to 29 Tick	22	31			
—— Pigeon, Heligoland . 28 to 36 Winds.	30	36			
Peas, White . . . 30 to 34 . Maple	27	29			

COVENT GARDEN, April 6.—Owing to the continued fine weather during the week, the market has been well supplied with most articles; and, generally speaking, there is not much alteration in their prices. Pine-apples are sufficient for the demand, and they are tolerably good in quality. Hothouse-Grapes are supplied in small quantities; they are offered at about 15*s.* per lb.; Portugals are plentiful. Good Apples are scarce; they have not altered in price since our last Report; the best dessert varieties are offered at about 28*s.* per bushel. Pears also continue to bring nearly the same prices as last week. Oranges are good, and very plentiful. Lemons are sufficient for the demand. Chesnuts are abundant, and are offered at last week's prices. Vegetables are, for the most part, plentiful, and they continue to improve in quality. Broccoli is good; it is offered at nearly the same price as last week. Savoys are now over for a season, and Brussels Sprouts are getting scarcer. Greens are still sufficient for the demand. Carrots and Turnips are abundant, and good in quality. Seakale and Asparagus are well supplied. French Beans are sufficient for the demand. Rhubarb of good quality is abundant. A few excellent Cucumbers are in the market; they are offered at nearly the same prices as last week. Strawberries are becoming more plentiful. Frame Potatoes bring about 3*s.* per lb. Among Cut Flowers are Erica Willmoreana, Euphorbia jacquiniflora, Gardenia radicans and florida, Acacias Azaleas, Camellias, Pelargoniums, Cinerarias, Fuchsias, Primulas, Lily of the Valley, and Roses.

FRUITS.

POTATOES.—Southwark Waterside, April 1.

The weather since our last report has been very fine, which favoured the growth of vegetables, causing a depression in our market. Several samples moved off tardily, at terms of this day week; on some samples a reduction was obliged to be made before sales could be effected. The Farmers are still employed with sowing their spring crops. Several cargoes during the past week have been shipped from Perth to Goole for plants. Notwithstanding, there has been some arrivals from those parts, also from the Channel Islands and Devonshire, and from the inland of Sussex by Railway, and by barges from Kent and Essex. Although the supplies have been limited, they are fully equal to the demand, and the annexed quotations were barely maintained.

Mark Fothergill.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, [illegible] inventors of the IMPROVED CONICAL and CYLINDRICAL BOILERS, having been much engaged in [illegible] upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to its [illegible] Tank now fitting up on their premises, which they have found to possess decided advantages over every other article hitherto offered for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and proportionately wide, of any width and depth, and can be connected or disconnected by any ordinary gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of availing themselves of this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers already fixed, and from the present low price of Iron and Pipes admit cheaper than of any other material. MR. RENDLE will be happy to undertake to receive orders and furnish estimates to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

HORTICULTURAL BUILDING & HEATING by HOT WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in two hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Buildings and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane square.

BERRIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to work as unprecedented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a section of the pipes, &c. 130, Fleet-street. A Prospectus may be had on application, &c.

THE CONICAL HOT-WATER BOILERS, invented by J. Rendle, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. S. having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as more efficient and economical; it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine-apple place; Messrs. Veitch & Sons, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season, particulars of which are in course of preparation.

GUANO, PERUVIAN, &c.—The above Manures, also Jarvis's Guano, Nitrates of Soda and Potash, Gypsum, Bone-dust, and other Chemical Manures of known value may be had of the undersigned, on the best terms, for cash.

Lists of Prices, with Synopsis of mode of use, on application to MARK PUTHERGILL, 40, Upper Thames-street, and 5, Railway Place, Mark-lane, London.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE. BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL; And their Agents, COLESWORTH, POWELL, AND PRYOR, LONDON; GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.

Lime-street, April 5, 1844.

GUANO ON SALE BY THE IMPORTERS, JOHN BOYD & Co., Warnford Chambers, London-bridge, Borough.

PERUVIAN GUANO, of first quality, and in any quantity, direct from the Bonded Stores. Also African Guano and Nitrate of Soda.—Apply to H. ROUNTHWAITE and Co., 1, St George's Crescent, Liverpool.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7s. per cwt.

Phosphate of Potash, 15s. per cwt.
" Soda 12s. "
" Magnesia 9s. "
" Ammonia 1s. per lb.

*** Super-phosphate of Lime in a concentrated form may also be procured of Messrs. WARNER, 28, Cornhill, and other Seedsmen, price 1s.

TO AGRICULTURISTS.

INDEPENDENT OF THE WORLD FOR CORN.

The attention of the Agricultural Interest, at this [illegible] is requested to the great importance of [illegible] MANURE, and the ease with which it may be applied by the use of FOWLER'S PUMPS, made expressly for [illegible] either portable or fixed; Garden, Ship, and Barge Pumps, also those for Distillers, Brewers, Soap-boilers, and [illegible] and solid liquor. Pumps kept for Hire, for Excavating Wells, Buildings heated by hot water, for Horticultural and every variety of manufacturing purposes. The trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

ASPHALTUM in its pure state, with all the material and instruction how to prepare, or if required, the labour performed at a moderate charge.

TOBACCO ASHES.—A few Tons of Tobacco Ashes to be Sold at 3l. per ton, convenient for land or water carriage.—Apply to J. A. HUBBARD and SON, 20, Harp-lane, Tower-street. All Letters prepaid.

THE URATE of the LONDON MANURE COMPANY, 8l. per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

NEW CHEMICAL MANURE.

HUMPHREYS'S FARMERS' COMPOUND, *stronger than Guano, and without its caustic rankness.* Samples on view at the Royal Polytechnic Institution. On Sale with the following Agents:—THOMAS GIBBS and Co., by appointment Seedsmen to the Royal Agricultural Society of England—corner of Half Moon-street, Piccadilly; COTTAM and HALLEN, Agricultural Repository, Winslow-street, Oxford-street; BURCHFIELD, Smithfield; BATT and RUTLEY, 412, Strand; CLARK, Bishopsgate-street; CHARLWOOD, Covent Garden; FLANAGAN and SON, Mansion-house street; FOTHERGILL, 40, Upper Thames-street; HURST and MCMULLEN, Leadenhall street; LOCKHART, Cheapside; WILLIAM and JOHN NOBLE, Fleet-street, W. J. NUTTING, Cheapside; WEDLAKE, Fenchurch-street; SAMUEL HOWARD, 38, Mark-lane; WHITE, Phœnix Wharf, Blackfriars; ALLEN, Shrewsbury; COPEMAN and Co., Wells, Norfolk; DICKSON and Co., Edinburgh; T. S. KING, Rochester. W. F. MOLESWORTH, Banbury; W. MADDOCK, Tunbridge Wells; W. E. RENDLE, Plymouth; THOMSON and Co., Macduff, near Banff; THOMAS WATKINSON, Market-place, Manchester. Price 12s. per cwt.—DAVY, MACKMURDO, and Co., Manufacturing Chemists, 100, Upper Thames street, London.

IMPORTANT TO AGRICULTURISTS AND OTHERS.

ANALYSES OF SOILS, MANURES, &c. are conducted by MR. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, A., Hawley Road, Kentish Town.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition, have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2s. 6d., quarts, 4s. 6d. each. One pint is sufficient to coat four Frames twice over, each Frame to be 6ft. by 3ft. 3in., or thereabouts. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsmen, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. BUTLER and MUCKLEY, Covent Garden, where a sample of prepared calico may be seen; Mr. WATKINSON, Market-place, Manchester; PAGE and SON, Southampton; T. and C. WHALLEY, Nurserymen, Liverpool.

Agents wanted for London and the country.

KEENE'S PATENT MARBLE CEMENT.—This CEMENT is particularly adapted for the Walls and Floors of Conservatories and Greenh uses, being calculated, from its extreme hardness, to resist the wear incident to ordinary Plastering. For Floors it has a threefold advantage over Stone-paving. 1st, in its lightness; one inch in thickness of KEENE'S CEMENT sufficing where 2 to 3 inch flagging would be employed. Next, in its appearance, combining, as it does, the hardness of stone with a uniform colour and even surface free from joints; and lastly, in economy, being one-third the price of Portland paving.

The most conclusive evidence can be given of the utility of KEENE'S CEMENT for these purposes by the Patentees and Manufacturers.—JOHN BAZLEY WHITE and Sons, Millbank-street, Westminster.

THE RIGHT OF PATENTING a valuable INVENTION for Ireland and Scotland for SALE. The Invention is an improved method of making Pipes, Tubes, and Tiles of Clay or other plastic substance, of any bore and any length. The uses to which they would be more particularly applied would be Draining, Sewerage, Conducting Water, Heating Greenhouses, Chimney-pots, &c. The Inventor reserves to himself the Patent for England. Any person interested in Draining in Ireland or Scotland would find the present opportunity worthy attention. Address, with real name and address, "DRAINER," at Mr. Searer's, 44, High Holborn.

HORTICULTURAL IMPROVEMENT.

READ'S PATENT GARDEN SYRINGE, for the invention of which he has been honoured with the Silver Medal of the Royal Horticultural Society, as being the best Instrument ever offered to their notice. J. R. has IMPROVED the above by an additional branch to turn in every direction, so that water may be dispensed into all pots in Conservatories, in a perpendicular direction, resembling a gentle shower or dewfall, and in any quantity, from a pint to a table-spoonful. Likewise small Machines, Pails, Trucks, and Garden-Engines of every description, that will discharge water in a continuous powerful stream, made on the most improved principle, and may be worked with half the usual labour required for other engines now in use. The above are the best adapted for destroying insects, which make such deadly havoc on all choice Fruit-trees and Plants in Gardens, &c., which the Patentee (from 31 years' experience in Gardening, and 23 years in manufacturing and improving instruments) can safely warrant. May be seen and proved at 35, Regent Circus, Piccadilly.

N.B.—None are genuine, except stamped with the words—"READ'S PATENT."

HENRY HUNT'S PATENT GARDEN POTS and STANDS, for effecting improved Drainage and Draught of Air. Patronised by Royalty and 30 Metropolitan and Provincial Horticultural Societies. Wholesale and Retail Depôt, 29, Queen's-row, Pimlico. The opinions of the Horticultural and Scientific Press, with priced Cards, forwarded on application, post-paid. Nurserymen in provincial towns appointed Agents.

RAMS FOR RAISING WATER WITHOUT LABOUR, WHERE A FALL CAN BE OBTAINED.

FOUNTAINS of every description. Specimens of the Fountain to be seen at the above address.

Also a Ram fixed on the premises. F. ROE, 70, Strand, London.

Every kind of Garden and other Pumps, Well Engines, &c.

MOST IMPORTANT TO FARMERS AND GRAZIERS.

GIBBONS' DISINFECTING OINTMENT, a most effectual and perfect cure for Epidemic and Foot-rot in Sheep; also for Epidemic and Foul in Cows' Feet, and for the Grease and Thrush in Horses; prepared only by HENRY GIBBONS, Agricultural Chemist, Wolverhampton.

This Ointment effectually destroys the American grub on Fruit-trees. Sold by all respectable Druggists in Town and Country, in packets at 2s. 6d. each. Mr. William Bailey, Manufacturing Chemist, North Street, Wolverhampton, is appointed Sole Wholesale and Shipping Agent.

ORNAMENTAL WIREWORK FOR THE GARDEN.

398, Oxford-street, London.

G. B. THOMPSON begs to tender his acknowledgments to the Nobility and Gentry who so kindly and liberally patronised his Manufacture of Ornamental Wirework, during the past years, and begs respectfully to remind them that with the opening season he has prepared an extensive assortment of Useful and Fancy Articles, suited to the Greenhouse and Flower-garden, and invites them to an inspection of his newly-arranged and well assorted stock of Flower-baskets, Trainers, Borders, Stands, Garden Arches, Temples, Vases, and durable Cast-Iron Garden Chairs and Seats, with his well-known and generally-approved Water-pot, fitted with finely-perforated roses, suited to the varying texture of different Plants, Hothouse Engines, Syringes, Fumigating Bellows, and all other Horticultural Tools and Implements of the most novel and improved manufacture. Game and Cattle Fences in variety.

LEVEL.—This Instrument, the invention of a Gentleman extensively engaged in Draining, is confidently recommended for its simplicity and cheapness; it requires only one person to use it, and gives the rise and fall in land as well as the level, and is also adapted for giving a uniform fall to drains. Each Level is packed in a case 18 inches by 3. Price, 2l. Direct to W. B. WEBSTER, Hounsdown, near Southampton.

100 CUCUMBER AND MELON-BOXES AND LIGHTS for Sale. One, Two, and Three-Light Boxes and Lights of all sizes ready for immediate use—best materials: packed and sent to all parts of the Kingdom by JAMES WATTS, Sash Manufacturer, and Hothouse Builder, Claremont-place, Old Kent-road. Garden Lights glazed and painted complete from 1s. per foot.

BEE-HIVES.—GEORGE NEIGHBOUR & SON beg to inform their Apiarian friends that they have prepared for the season a large supply of "Nutt's Patent Bee-hives" (for the sale of which they are the only authorised agents), in which are embodied all the recent improvements. Their selection now comprehends most varieties in general use at the present time, including the "Single Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with glasses, &c., from either of which the produce may be taken at any time of the gathering season, without destroying the Bees.

G. N. & SON have also Glass Hives, and other articles connected with Bee management, a catalogue of which, with drawings, may be obtained. Letters of inquiry must have postage stamps inclosed.—Apiarian Depot and Honey Warehouse, 127, High Holborn, London.

Warner's Incomparable Large, late Marrow Peas, 2s. per quart. Potter's celebrated Liquid Guano, in quart bottles. 1s 9d. each.

VEGETABLE.—Turnip-rooted Chervil, very delicious, 6d. per paper; Potatoes, new early American, a very superior kind, 3s. per peck.

W. and W. beg to refer their friends to their list of New and Choice Flower and Vegetable Seeds in *Harrison's Floricultural Cabinet*, and the *Gardeners' Chronicle* for April and the preceding months; also to inform them they have now ready a Choice Collection of Herbaceous and Rock Plants, including all the New Varieties.

A General Catalogue of Garden and Flower-seeds may be had, on application by post, as a single letter.

WM. JOHN CORMACK, AGRICULTURAL SEEDSMAN by Appointment to His Royal Highness PRINCE ALBERT, New Cross, Surrey, and Bedford Conservatory, Covent Garden, begs to call the attention of the Nobility, Gentry, and Agriculturists in general to his combinations of GRASS SEEDS for Permanent Pasture, the Alternate Husbandry, Parks, Lawns, &c. (as recommended and practised by his partner, the late Mr. GEORGE SINCLAIR, Author of the "Hortus Gramineus Woburnensis.") Upwards of 25,000 acres have been converted to permanent pasture by this establishment with the greatest success. Parties requiring Seeds are respectfully requested to state the nature of the soils. Mangold Wurzel, Carrot, and Turnip-seed of excellent sorts, saved from transplanted bulbs. Garden and Agricultural Seeds of the best quality and most approved kinds.

N.B.—Cormack's British Queen and Prince Albert Peas, at 3s. 6d. per quart.

J. G. WAITE, SEEDSMAN, &c., 1 & 4, Eyre Street-Hill, Hatton Garden, London, begs to refer the readers of the *Gardeners' Chronicle* to his priced list of Seeds which appeared in this paper of March 23, p. 191.

Agriculturists and the farming community generally, will perceive his prices of Turnips, &c., are quoted much below all other houses in the trade, but at the same time they will please to bear in mind they are second to none, in point of Stock and growth.

	per lb.—s. d.

Superior Yellow Globe do. do.	0 9
,, Red do. do. do.	0 9
Fine Selected Altringham Carrot	0 9
Large Green-top White Belgium do.	0 8

Grass Seeds of every description mixed to suit the soil for which they may be required, so as to ensure a good sward, either in Lawns, Parks, Permanent Pasture, or alternate course of Husbandry.

SEEDLING VERBENAS.

E. H. FULLER respectfully informs the Public that he intends sending out in April the following new and distinct Varieties of VERBENAS, which have been universally admired, and submitted to Dr. LINDLEY.—Vide *Gardeners' Chronicle*, Oct. 14, 1843, p. 721.

E. H. FULLER, No. 2 (INCOMPARABLE), "brilliant rich purple, with a white eye, the best of its colour we have seen."—Plants in April, 5s. each.

No. 3, LUCASII, "delicate pink, clear and good."—2s. 6d. each.

No. 4, LOUIS-PHILIPPE, "rosy-purple, clear and steady in colour, a good Variety."—Plants 3s. 6d. each.

"These flowers are characterised by having the colours very clean, not dirty nor uncertain, as it frequently happens. The flowers are rather small, but this may arise from want of better cultivation."

The usual trade allowance if three or more plants are ordered. All orders will be sent post-free, or by coach, paid to London. A Catalogue of Fuchsias, Geraniums, &c. &c. will be forwarded by post on application.—Worthing, March 14, 1844.

BULB CUCUMBER-GLASSES, for Watering by Evaporation during the growth of the Fruit, 2s. 6d. to 3s. 6d. each; GRAPE-GLASSES, with holes, 1s. 9d to 2s. 6d. each; BEE-GLASSES, 1s. to 2s. 6d. each. Cylindrical CUCUMBER-TUBES, from 6d. to 4s. each; PROPAGATING-GLASSES, Green, 1s. per lb.; white, 1s. 2d. per lb.; or 2s. 6d. to 24s. per dozen; FISH-BOWLS, from 1s. 6d. each; ditto, with hole in the bottom for Fountains, 2s 6d. per lb., at APSLEY PELLATT'S Falcon Glass Works, Holland-street, Blackfriars. Orders from the country, accompanied with a Post-office order, will meet with prompt attention.

MECHI'S ELECTROTYPE FORKS & SPOONS. After a most careful examination and consideration, I have come to the conclusion that I can safely warrant and recommend this article as being superior to the plated, or German silver, or any other kind of plating. The article being in a finished state, the silver is deposited on it by electricity, without any solder, so that when the edges wear in course of time, there is no blackness or unsightliness, and no one could distinguish between the worn and unworn parts, the article on which it is fixed being hard white metal, so near the colour of silver. The electric fluid amalgamates inseparably the two bodies, so that nothing can divide them. Long-continued wear can alone remove the silver surface. The prices are, dessert forks, 42s.; table ditto, 56s.; table-spoons, 62s.; dessert-spoons, 45s.; tea-spoons, 26s. per dozen.—J. I. MECHI, No. 4, Leadenhall-street, London, Manufacturer of Table Cutlery, Dressing Cases, Bagatelle Tables, &c.

ON SATURDAY APRIL 20th, WILL BE PUBLISHED, PRICE SIXPENCE, STAMPED TO GO FREE BY POST,

The FIRST NUMBER of

The Railway Chronicle.

JOURNAL OF ENGINEERING IMPROVEMENTS, MECHANICAL INVENTIONS PUBLIC WORKS, &c.

THERE HAS BEEN CREATED within the last ten years a PRODUCTIVE PROPERTY IN RAILWAYS amounting to more than SIXTY MILLIONS sterling, with a REVENUE of nearly SIX MILLIONS PER ANNUM. This addition to the wealth and resources of England has been produced by the Investment of the funds of nearly Fifty Thousand Individuals, who form the Railway Constituency of Great Britain. It affords employment to a great body of our Workmen, tends to the development of our industrial Capabilties, and is a boon to the whole travelling Population.

It is strongly felt that Railway property, involving interests so extensive, should not be exposed to the injurious effects which the want of sound information and the circulation of erroneous statements for party purposes so constantly produce; and it has appeared, to those most capable of judging, that the mutual interests of the Proprietary, the Managers, and the Railway Executive, and the Public interests with which they are identified, have as yet found *no* organ in which they can be fairly discussed and satisfactorily adjusted. The Railway Chronicle has been projected to supply this deficiency, by THE ESTABLISHMENT OF AN AUTHENTIC AND IMPARTIAL MEDIUM OF COMMUNICATION BETWEEN ALL THE MEMBERS OF THE GREAT RAILWAY COMMUNITY; having especially in view the free communication of useful information, the promotion of the common interests and the general circulation of sound intelligence in all that relates to Railway property.

The Conductors of the Railway Chronicle are men of practical experience, who possess peculiar facilities for obtaining the earliest information, and who will use their anxious endeavours to advance, in every way, the great interests of Railway property, avoiding all indulgence of personal feeling, the expression of party prejudice, or the advancement of exclusive interests;—they desire, in short, to furnish an unbiassed Chronicle of facts, and a fair arena for the discussion of important opinions and principles.

The Railway Chronicle will contain the earliest and most authentic information on the following subjects:—

THE CONDITION AND PROSPECTS OF RAILWAYS NOW IN USE.
POSITION, PROGRESS, AND VALUE OF FOREIGN RAILWAYS.
PROGRESS OF RAILWAYS IN EXECUTION.
PROJECTED NEW RAILWAYS.
THE TRAFFIC AND REVENUE OF RAILWAYS.
THE ECONOMY OF WORKING AND EXPENDITURE.
THE VALUE OF SHARES.
PAYMENT OF CALLS, DIVIDENDS, AND DEBENTURES.
THE PROCEEDINGS AT RAILWAY MEETINGS, WITH THE DOCUMENTS LAID BEFORE SUCH MEETINGS.
WEEKLY REPORTS ON THE MONEY AND SHARE MARKETS.
THE PROCEEDINGS OF THE BOARD OF TRADE AND OTHER PUBLIC OR MUNICIPAL BODIES, SO FAR AS THEY AFFECT THE INTERESTS OF RAILWAY PROPERTY.
PARLIAMENTARY RAILWAY PROCEEDINGS.
RAILWAY LEGAL INFORMATION.
CONTRACTS FOR EXECUTION OF WORK.
STATE OF THE IRON TRADE.
ENGINEERING WORKS OF MERIT ON RAILWAYS AT HOME AND ABROAD.
ENGINEERING IMPROVEMENTS ON RAILWAYS AT HOME AND ABROAD.
MECHANICAL INVENTIONS RELATING TO RAILWAYS AT HOME AND ABROAD, ILLUSTRATED, WHEN REQUISITE, BY WOOD-CUTS.
LOCOMOTIVE IMPROVEMENTS AND INVENTIONS AT HOME AND ABROAD.
REPORTS OF THE SCIENTIFIC SOCIETIES, WHENEVER ANY SUBJECTS AFFECTING RAILWAYS ARE DISCUSSED.
RAILWAY LITERATURE.
RAILWAY PATENTS.

To eludicate which, Illustrative Maps and Engravings will be given, when necessary.

Arrangements have been made for the purpose of supplying in the Railway Chronicle the earliest information concerning the FRENCH RAILWAYS (*the figures being in English money*), in which so much British capital is now invested, and the other Railways on the Continent which are in progress or in prospect. Intelligence will leave Paris every week in time for insertion in the Railway Chronicle, which will thus contain the transactions in the Paris Railway Stocks, and receipts of the various lines up to the latest hour, and furnish the earliest notice of whatever may affect the British holder.

Weekly Reports from the London, Liverpool, Manchester, and Northern Share Markets will afford the Capitalist the means of judging of the condition of Railway investments.

Another peculiar feature of the Railway Chronicle is to consist in a series of papers on each of the Great British Railways—in which the Past History, Present Condition, and Future Prospects of every Railway will be concisely developed. It is hardly to be presumed, that the great number of persons who have of late years begun to interest themselves in Railway Property, can have had the leisure and opportunity necessary to understand the peculiar circumstances and character of each individual Railway, so as to estimate properly the relative value and prospective profit of these investments. This information will be given in the successive Numbers of the Railway Chronicle. For those who are now becoming subscribers for the first time to a Railway Paper, this feature is important, as it will enable them rapidly to obtain an acquaintance with the whole of the existing lines.

TO CAPITALISTS, BANKERS, SOLICITORS, STOCK-BROKERS, INSURANCE COMPANIES, and all who hold Money for investment, the Railway Chronicle will furnish such sound unprejudiced information as shall enable them at once to make a judicious choice for the investment of funds at their disposal.

TO ENGINEERS, the Railway Chronicle will afford information on all points of Practical Engineering that may tend to the advancement of the profession, and to the perfection of that Railway communication which their talents have placed in its present admirable condition, and which it remains for their skill to render more available to the Public, and therefore more beneficial to the Shareholder. Through this channel of intercommunication every intelligent person will have an opportunity of contributing to the common stock of knowledge, and consequently to the general welfare.

TO CONTRACTORS, MANUFACTURERS, INVENTORS, and PRACTICAL ENGINEERS and MECHANICS, the Railway Chronicle will afford the means of bringing before the Influential Part of the Railway Proprietary, such Inventions, Discoveries, Practical Works, Mechanical Improvements and Articles of Manufacture, as they may desire to introduce into Railway employment; and it will afford the means of ascertaining where their practical assistance can be required either on lines projected or in execution. Thus the columns of the Railway Chronicle will open a market for the labour of the Contractor, the inventions of the Mechanist, and the commodities of the Manufacturing Engineer.

The Railway Chronicle

Will be published EVERY SATURDAY, in time for the Morning Mails.

☞ Orders received by all Newsmen.

Office for Advertisements and Communications, 14, Wellington-street North, Strand, London.

BOTANICAL & GARDENING WORKS

PRINTED FOR

LONGMAN, BROWN, GREEN, & LONGMANS.

THE THEORY OF HORTICULTURE; or, an Attempt to explain the Principal Operations of Gardening upon Physiological Principles. By JOHN LINDLEY, Ph.D., F.R.S. 8vo. Illustrations on Wood. 12s. cloth.

INTRODUCTION TO BOTANY. By Professor J. LINDLEY, Ph.D., F.R.S. Third Edition, with Corrections and considerable Additions. 8vo. Six Plates and numerous Woodcuts, 18s.

A NATURAL SYSTEM OF BOTANY; or, a Systematic View of the Organization, Natural Affinities, and Geographical Distribution of the whole Vegetable Kingdom; together with the uses of the most important species in Medicine, the Arts, and Rural or Domestic Economy. By JOHN LINDLEY, Ph.D., F.R.S. Second Edition, with numerous Additions and Corrections, and a complete List of Genera, with their Synonyms. 8vo. 18s.

SCHOOL BOTANY; or an Explanation of the Characters and Differences of the principal Natural Classes and Orders of Plants belonging to the Flora of Europe, in the Botanical Classification of DE CANDOLLE. For the use of Students preparing for their matriculation examination in the University of London, and applicable to Botanical Study in general. By JOHN LINDLEY, Ph.D., F.R.S., Fcp. 8vo., with upwards of 160 Woodcuts, 6s.

A SYNOPSIS OF THE BRITISH FLORA, arranged according to the Natural Orders. By Professor JOHN LINDLEY, Ph.D., F.R.S., &c. The Third Edition, with numerous Additions, Corrections, and Improvements, 12mo. 10s. 6d.

GUIDE TO ORCHARD AND KITCHEN GARDEN; Or, an Account of the most valuable Fruits and Vegetables cultivated in Great Britain: with Kalendars of the Work required in the Orchard and Kitchen Garden during every month in the year. By GEORGE LINDLEY, C.M.H.S. Edited by Professor LINDLEY. 8vo. 16s.

AN ENCYCLOPÆDIA OF GARDENING; presenting in one systematic view, the History and Present State of Gardening in all Countries, and its Theory and Practice in Great Britain. with the Management of the Kitchen Garden, the Flower Garden, Laying out Grounds, &c. By J. C. LOUDON, F.L.S., &c. New Edition, enlarged and much improved. 8vo. With nearly 1,000 Woodcuts, 2l. 10s.

AN ENCYCLOPÆDIA OF PLANTS; including all the Plants which are now found in, or have been introduced into Great Britain; giving their Natural History, accompanied by such descriptions, engraved figures, and elementary details, as may enable a beginner, who is a mere English reader, to discover the name of every Plant which he may find in flower, and acquire all information respecting it. New Edition, with a Supplement. By J. C. LOUDON; W. H. BAXTER, Jun.; GEORGE DON, F.L.S.; and J. D. C. SOWERBY, F.L.S. 1 vol. 8vo. with nearly 10,000 woodcuts, 3l. 13s. 6d.

HORTUS BRITANNICUS; a Catalogue of all the Plants indigenous to, or introduced into Britain. Third Edition, with a NEW SUPPLEMENT, prepared, under the direction of J. C. LOUDON, by W. H. BAXTER, and revised by GEORGE DON, F.L.S. 8vo. 31s. 6d. The First Supplement, separately, 2s. 6d., the New Supplement, separately, 8s.

THE ROSE AMATEUR'S GUIDE; containing ample Descriptions of all the fine leading varieties of Roses, regularly classed in their respective families; their History, and Mode of Culture. By T. RIVERS, Jun. Third Edition, corrected and improved. Fcp. 8vo. 6s.

THE TREE-LIFTER; or, a new Method of Transplanting Trees. By Colonel GEORGE GREENWOOD. 8vo. with illustrative Plate. 7s.

A SCRIPTURE HERBAL. With upwards of 120 Wood Engravings. By LADY CALLCOTT. Square crown 8vo. 1l. 5s.

CONVERSATIONS ON BOTANY. Ninth Edition, improved, fcp. 8vo., with 22 Plates, 7s. 6d.; with the Plates coloured, 12s.

THE PRINCIPLES OF DESCRIPTIVE AND PHYSIOLOGICAL BOTANY. By J. S. HENSLOW, M.A., F.L.S., &c. Fcp. 8vo. with Vignette Title, and nearly 70 Woodcuts, 6s.

A PRACTICAL TREATISE ON THE CULTIVATION OF THE GRAPE VINE ON OPEN WALLS. By CLEMENT HOARE. Third Edition, 8vo. 7s. 6d.

AN INTRODUCTION TO THE STUDY OF BOTANY. By Sir J. E. SMITH, late President of the Linnean Society. Seventh Edition (1833), corrected; in which the object of Smith's "Grammar of Botany" is combined with that of the "Introduction." By Sir WILLIAM JACKSON HOOKER, K.H., LL.D., &c. 8vo. 36 Steel Plates, 16s.; with the Plates coloured, 2l. 12s. 6d.

THE ENGLISH FLORA. By Sir JAMES EDWARD SMITH, M.D., F.R.S., late President of the Linnean Society, &c. 6 vols. 8vo. 3l. 12s.

CONTENTS:

Vols. I. to IV. The FLOWERING PLANTS and the FERNS, 2l. 8s.

Vol. V. Part 1, 12s.—CRYPTOGAMIA; comprising the Mosses, Hepaticæ, Lichens, Characeæ, and Algæ. By Sir W. J. HOOKER.

VOL. V. Part 2, 12s.—The FUNGI—completing the work, by Sir J. W. HOOKER, and the Rev. M. J. BERKELEY, F.L.S., &c.

COMPENDIUM OF THE ENGLISH FLORA. By Sir J. E. SMITH. Second Edition, with Additions and Corrections by Sir W. J. HOOKER. 12mo. 7s. 6d.

THE SAME IN LATIN. Fifth Edition, 12mo. 7s. 6d.

THE BRITISH FLORA. In Two Vols. Vol. I., comprising Phænogamous or Flowering Plants and the Ferns. By Sir WILLIAM JACKSON HOOKER, K.H., LL.D., F.R.A., and L.S. &c. &c. &c. Fifth Edition, with Additions and Corrections; and 173 Figures illustrative of the Umbelliferous Plants, the Composite Plants, the Grasses, and the Ferns. 8vo. with 12 Plates, 14s.; with the Plates coloured, 24s.

Vol. II. in Two Parts, comprising the Cryptogamia and Fungi, completing the British Flora, and forming Vol. V., Parts 1 and 2, of Smith's English Flora, 24s.

THE VEGETABLE CULTIVATOR; containing a plain and accurate Description of all the different Species of Culinary Vegetables, with the most approved Method of Cultivating them by Natural and Artificial Means, and the best Modes of Cooking them; with a Description of the Physical Herbs in General Use. By JOHN ROGERS, Author of "The Fruit Cultivator." Second Edition. Foolscap 8vo. 7s.

"'Rogers's Vegetable Cultivator' is a useful book."—*Gardeners' Chronicle.*

LONDON: LONGMAN, BROWN, GREEN, & LONGMANS.

Printed by WILLIAM BRADBURY, of Stoke Newington, and FREDERICK MULLER EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, printers, at their office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the office No. 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, April 6, 1844.

The Newspaper.

SATURDAY, APRIL 6, 1844.

E. G. P. NEISON, Actuary.

PROVIDENT LIFE OFFICE, 50 REGENT STREET, FEB. 15, 1844.

BONUSES DECLARED, 529,306*l.* 17*s.* 7*d.*

NOTICE is hereby given, that all Persons who hold Policies in this Office, bearing date prior to the year 1834, may receive the present value of the Bonuses which have been added to their Policies, upon application at the Head Office, or to the Agents through whom the Policies were issued.

GEORGE BEAUMONT, Actuary.

ARGUS LIFE ASSURANCE COMPANY, No. 39, Throgmorton-street, Bank.

Empowered by special Act of Parliament, 5 & 6 W. IV., c. 76.

Thomas Farncomb, Esq., Alderman, *Chairman.*

William Leaf, Esq., *Deputy-Chairman.*

Richard E. Arden, Esq.
William Banbury, Esq.
Edward Bates, Esq.
Thomas Camplin, Esq.
James Clift, Esq.
J. Humphery, Esq., M.P.,
Rupert Ingleby, Esq.
Thomas Kelly, Esq., Alderman.
Jeremiah Pilcher, Esq.
Lewis Pocock, Esq.

Physician—Dr. Jeafferson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq., 2, Frederick's place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.

Advantages of the Argus Life Assurance Company.

Low Rates of Premiums.

In addition to the subscribed capital of 300,000*l.*, the Assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company. The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby in effect giving to every Policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to assure £100.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 19 1	£1 11 10
30	1 1 8	1 2 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of the whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the policy for life, or may be paid off at any time without notice.

In Assurances for advances of money as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the ARGUS Office will be found to be particularly favourable to the Assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.

A Liberal Commission to Solicitors and Agents.

NATIONAL MERCANTILE LIFE ASSURANCE SOCIETY, ARTHUR-STREET WEST, LONDON BRIDGE. (Established in 1837.)

Directors.

Chairman.—Robert Currey, Esq.

Edward Baker, Esq.
Jasper Capper, Esq.
Thomas Dakeyne, Esq.
Giles Redmayne, Esq.
James Spicer, Esq.
Henry Sterry, Esq.
Thomas Bax, Esq.
Joseph Cooper, Esq.
Russell Jeffrey, Esq.
William R. Spicer, Esq.
Joseph Sterry, jun., Esq.
Robert Wilcoxon, Esq.

Bankers.—Messrs. Prescott, Grote, and Co.

ADVANTAGES.

A BONUS of two-thirds of the Profits allotted to the Assured.

LOWER RATES OF PREMIUM charged for Assurances without profits.

PREMIUMS payable Annually, Half-yearly, or Quarterly.

ASSURANCES OF EVERY DESCRIPTION may be effected. Among others, the important one, *originated by this Society*, of securing a sum to the Assured himself on his attaining any given age, or to his family *in the event of his earlier death.*

A POCKET DIARY containing detailed particulars, may be had on application at the Office, or of the Society's agents.

JENKIN JONES, Actuary and Secretary.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, WATERLOO-PLACE, LONDON.

Directors.

The Chisholm, *Chairman.* Wm. Morley, Esq., *Deputy-Chairman.*

John Brightman, Esq.
Francis Brodigan, Esq.
James William Deacon, Esq.
Jonathan Duncan Dow, Esq.
Alexander Robert Irvine, Esq.
John Inglis Jerdein, Esq.
James John Kinloch, Esq.
Henry Lawson, Esq.
Robert Power, Esq.
The Reverend F. W. Johnson Vickery, A.M.

Auditors.

C. B Rule, Esq.—T. C. Simmons, Esq.—George Thomas, Esq.

Physician.—John Clendinning, M.D., 16, Wimpole-street.

Solicitor.—Walter Prideaux, Esq., Goldsmiths' Hall.

Bankers.—Union Bank of London.

ADVANTAGES OF THIS INSTITUTION.

The whole of the Profits divided ANNUALLY among the Holders of Policies on which five Annual Premiums shall have been paid.

Credit given for half the amount of the first five Annual Premiums, by which means Assurances may be effected and loans for short periods secured with the least possible present outlay; and after payment of the arrears, the Policy-holder will become entitled to participate in the entire profits of this Institution, precisely in the same manner as if he had paid the whole amount of his Premiums in advance in the usual way.

Thus, for example—a person in the 25th year of his age, instead of paying 2*l.* 6*s.* per annum for an Assurance of 100*l.*, would be required to pay 1*l.* 3*s.* only during the first five years, when, on payment of the arrears of Premium, amounting to 6*l.* 15*s.*, his share of the profits would be such as to reduce his future Annual Premiums to very little more than the half Premium of 1*l.* 3*s.* originally paid by him. The GREAT BRITAIN is the only Mutual Assurance Society in which this very great accommodation is given to the Assured.

Credit allowed for the whole of the first five Annual Premiums on satisfactory security being given for the payment of the same at the expiration of five years.

Transfers of Policies effected and registered (without charge) at the Office.

Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Assured, to be especially convened on the occasion.

Holders of Policies of 1000*l.* entitled (after payment of five Annual Premiums), to attend and vote at all General Meetings of the Assured, who will have the superintendence and control of the funds and affairs of the Society.

Full particulars are detailed in the Prospectus, which, with every requisite information, may be obtained by application to

A. R. IRVINE, *Managing Director.*

WORKS on AGRICULTURE, GARDENING, &c.,

In one volume foolscap 8vo., with numerous Woodcuts, representing the process of Grafting, Budding, Layering, &c. &c. Third Edition, enlarged. Price 6*s.* 6*d.* cloth. Nearly Ready. Published by WILLIAM SMITH, 113, Fleet Street.

J. C. LOUDON'S ENCYCLOPÆDIAS.

New Edition, with a New Supplement, one very large volume, 8vo., with nearly 10,000 Engravings on Wood, 3*l.* 13*s.* 6*d.* cl.

ENCYCLOPÆDIA of PLANTS; including all the Plants which are now found in, or have been introduced into, Great Britain; giving their Natural History, with such Descriptions and Figures as may enable a beginner who is a mere English reader, to discover the name of every Plant which he may find in Flower.

Edited by J. C. LOUDON, F.L.S.H.S. &c.

"The most useful and popular botanical work which has ever appeared in the English language."—*Professor Jameson's Philosophical Journal.*

By the same Author,

ENCYCLOPÆDIA of GARDENING. 2*l.* 10*s.*
ENCYCLOPÆDIA of AGRICULTURE. 2*l.* 10*s.*
HORTUS BRITANNICUS. 1*l.* 11*s.* 6*d.*
ENCYCLOPÆDIA of TREES and SHRUBS. 2*l.* 10*s.*
ENCYCLOPÆDIA of COTTAGE ARCHITECTURE. 3*l.* 3*s.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

Now Ready.

LOUDON'S ARBORETUM ET FRUTICETUM BRITANNICUM. In 8 vols. 8vo (4 of letterpress and 4 of plates), with a new and corrected impression of the plates, price 10*l.*, cloth lettered.

This work was published by the late Mr. LOUDON, at his own expense; and it not only occupied his time and that of his numerous assistants for upwards of four years, but cost so large a sum as to leave him, at its close, nearly ten thousand pounds in debt. To pay this sum, Mr. LOUDON placed the whole of his literary property, which was very considerable, in the hands of his publishers, Messrs. Longman, to act as trustees till the whole debt was paid; and thus, though the late Mr. LOUDON died possessed of the copyright of thirteen valuable works, his family cannot derive any advantage from them till the remainder of the debt owing on the "Arboretum" (still amounting to more than fifteen hundred pounds) is paid. As the "Arboretum Britannicum" has been spoken of in the highest terms in all the principal Reviews of Europe and North America, and as the "Quarterly Review" says that it is "a book of solid value, worthy of a place in the library of every landed gentleman," it is hoped that such noblemen and gentlemen as do not possess a copy will purchase one; as, if 150 copies could be sold, the whole of Mr. LOUDON'S literary property would be set free for the benefit of his widow and family. Orders will be most serviceable to the family, if addressed to Mrs. LOUDON, Bayswater, near London.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

THE FARMER'S LIBRARY.

One very thick volume, 8vo, with Wood Engravings of the best and most approved Agricultural Implements, 50*s.* cloth.

THE FARMER'S ENCYCLOPÆDIA, and DICTIONARY of RURAL AFFAIRS. By CUTHBERT W. JOHNSON, Esq., F.R.S., Barrister-at-Law, Editor of "The Farmer's Almanack," &c.

"Clearly and perspicuously written, full of useful and interesting information, and well worthy of being recommended as a valuable addition to the bookshelves of all our Agricultural friends."—*Quarterly Journal of Agriculture.*

"The farmers will, we doubt not, duly appreciate the mass of sound information provided for them by Mr. Johnson, whose knowledge of his subject is profound, his style clear and discriminating, and his remarks on all topics connected with gardening and rural economy full of condensed interest."—*Farmer's Magazine.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

New Edition, now ready, price 16*s.* bound in cloth,

MANURES. By C. W. JOHNSON, Esq., F.R.S., &c. brought down to the present time, and giving the fullest and most authentic information on every kind. Also, by the same Author, TRACTS for the Use of AGRICULTURAL SCHOOLS, price 1*s.* each. On Agricultural Chemistry—The Young Farmer's Calendar; and the Cottage Farmer's Assistant, containing Cottage Cookery, &c.

JAMES RIDGWAY, Piccadilly.

Also—1. A Fourth Edition of MORTON on SOILS; with the Two Reports of Whitfield Example Farm. Price 10*s.*

2. A New Edition of SINCLAIR on GRASSES. Price 30*s.*, coloured plates.

Now ready, with woodcuts, post 8vo, 12*s.*,

SCENES and TALES of COUNTRY LIFE, with Recollections of Natural History. By EDWARD JESSE, Esq., Surveyor of Her Majesty's Parks and Palaces.

JOHN MURRAY, Albemarle-street.

RELATION OF LANDLORD AND TENANT.

Just published, in one vol. royal octavo, price Two Guineas,

THE VALUE of LANDED PROPERTY, demonstrated by Practical Deductions and Illustrations, tending especially to facilitate the Valuation of Estates, as applicable to the purposes of Agriculture. In which is defined the equitable Rent of the different descriptions of Land, and also the share of the Agricultural Products that constitutes the Occupier's Profit. By LAYTON COOKE, Land Agent and Surveyor.

Published by the Author at No. 7, John-street, Adelphi, London.

NOW READY, price 1*s.*

PERUVIAN and BOLIVIAN GUANO, with Full PRACTICAL Instructions for its Use, and Testimonials of its Properties and Results.—JAS. RIDGWAY, Piccadilly, and every Country Bookseller. Also,

1. The Fourth Edition, enlarged, of Morton on Soils, price 10*s.*
2. Agricultural Chemistry for the Practical Farmer, by C. Squarey, 5*s.*
3. A New Edition of "Sinclair on Grasses." Coloured plates, price 30*s.*

New Edition, price 25*s.* each vol.

DR. LINDLEY'S LADIES' BOTANY, in 2 vols. 8vo, each containing 50 beautifully coloured Plates.

2. DR. LINDLEY'S BOTANICAL REGISTER, published Monthly, price 3*s.* 6*d.* each No., beautifully coloured. The vol. for 1843, bound in cloth, price 2*l.* 4*s.*, is now ready.

3. DR. LINDLEY'S SPLENDID WORK on ORCHIDACEOUS PLANTS is now complete in Ten Parts, price 25*s.* each.

4. A New Edition of SWEET'S HORTUS BRITANNICUS, or Catalogue of Plants. Edited by DON. Price 21*s.*, bound in cloth.

5. SWEET'S BOTANICAL CULTIVATOR. Price 16*s.*, bound in cloth.—JAMES RIDGWAY, Piccadilly; and all Booksellers.

THE LATE MR. LOUDON.—The following Subscribers to the Works of the late Mr. LOUDON have been obtained since making up the list which appeared in the *Gardeners' Chronicle* of Saturday last.

ARBORETUM BRITANNICUM—10*l.*

Richard Hodgson, Esq., M.P., 13, Upper-Brook-street.

ENCYCLOPÆDIA OF TREES AND SHRUBS—5*0s.*

The Reform Club
Richard Fuller, Esq., Chichester
Mr. Sawyer
Mr. Joseph Goode, Messrs. Booths, Hamburgh
William Sutcliffe, Esq., Bath

HORTUS LIGNOSUS LONDINENSIS (Abridged)—3*s.* 6*d.*

Mr. F. Rauch, Paris, 2 copies.

THE SUBURBAN GARDENER—1*l.*

John Stoveld, Esq., Petworth
Messrs. Bunyard and Son, Maidstone, a second copy
Mr. Ford, Alderley Park, Cheshire
Miss E. Rogers, the Priory, Bodmin
Lady Wenlock, Paris
Thomas Boyes, Esq., Hamburgh
Joshua Walker, Esq., Park-place Gardens, Maida-hill
B. Edgington, Esq., Duke-street, Southwark

THE SUBURBAN HORTICULTURIST—16*s.*

Thomas Boyes, Esq., Hamburgh
B. Edgington, Esq., Duke-st., Southwark

REPTON'S LANDSCAPE GARDENING—Plain, 30*s.*

Mr. E. Denyer, Loughborough Road, North Brixton
Lady Wenlock, Paris

REPTON'S LANDSCAPE GARDENING—Coloured, 66*s.*

Joseph Anderson, Esq., The Holme, Regent's Park.

ENCYCLOPÆDIA OF COTTAGE ARCHITECTURE—63*s.*

THE GARDENERS' MAGAZINE—9 vols., 9*l.* 17*s.*

The Countess of Radnor; the Nos. for March to Dec., 1842,
inclusive, and the No. for January, 1843.

ROYAL POLYTECHNIC INSTITUTION.—The arrangement for the EASTER HOLIDAYS includes the Exhibition of LONGBOTTOM'S PHYSIOSCOPE, a new Instrument, which shows the human face on a Disc magnified to the size of Twelve Feet. The OPAQUE MICROSCOPE, with Electrotypes in Gold, after a Selection from the Elgin Marbles. A New Set of DISSOLVING VIEWS, including the OLD and NEW HOUSES of PARLIAMENT, with the FIRE. POPULAR LECTURES, with brilliant Experiments by Dr. Ryan and Professor Bachoffner, illustrated by ARMSTRONG'S HYDRO-ELECTRIC MACHINE, and other Apparatus. CARY'S OXY-HYDROGEN MICROSCOPE, DIVER and DIVING-BELL, &c., &c. MODELS of various KINDS of MACHINERY in motion. Open from Eleven to Half-past Five, and from Seven to Half-past Ten. Admission, 1*s.* Schools, Half-price.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

News of the Week.

THE Overland Mail from India of the 1st of March has arrived this week. The most important intelligence it brings is the announcement of the pacification of India. The supremacy of the British Government has been admitted in Gwalior, and our army has returned into the British territory with the artillery and other contributions obtained from the conquered state. There has been no renewal of disturbances in Scinde, but three of the Bengal and Madras native regiments had shown a rebellious disposition on being ordered to serve in that unhealthy country. The condition of Lahore is still threatening, although no actual outbreak has taken place; the apprehension, however, of further troubles is proved by the collection of a large force of our Indian troops on the banks of the Sutlej, in order to be prepared for any emergency. From China the advices state that the mercantile arrangements are going on to the satisfaction of the British and Chinese authorities, and that the best feeling exists between our merchants and the native population.—From France the news is chiefly of a

domestic character, the proceedings of the Chamber having lost, for the remainder of the Session, that tone of excited feeling in regard to the foreign policy of the government, which made its debates so important to the rest of Europe.—The arrival of Queen Christina at Madrid, the capitulation of Carthagena, and the death of Senor Arguelles, the distinguished statesman and ex-guardian of Queen Isabella, which took place while the Queen Mother was entering the capital, are the chief topics of our news from Spain. The surrender of Carthagena gives the Government possession of the whole country, and for the present the disturbances may be considered at an end. A general amnesty is mentioned as a measure likely to be adopted in commemoration of this event, but the leading exiles of Spain are to be excluded from its benefits.—The state of Italy is becoming every day more serious, and the feeble governments of the Italian peninsula are at length awakened to the fact that a general conspiracy has been formed to revolutionise the entire country during the present spring. The disturbances in the central provinces of the Kingdom of Naples have spread to the inaccessible coasts of Calabria, and the fresh arrests which are daily taking place at Naples prove the existence of the conspiracy in the heart of the capital itself. The Papal States are on the verge of insurrection, and public prayers and religious ceremonies have been ordered by the Pope as a means of averting the coming storm. The intervention of Austria is considered inevitable in some quarters, but it is believed that such a step would inevitably be followed by a counter occupation of one or more of the Roman garrisons by France.

At home, Parliament adjourned on Tuesday for the Easter recess, after the introduction of various measures preparatory to their discussion after the holidays. Among these is the amended Poor Law of Government, retaining the disputed 12-hours clause, upon which it is understood that Ministers will stake their continuance in office. The revenue returns have been published this week, and exhibit a gratifying proof that the productive energies of the people have improved, and that trade and consumption are steadily increasing. The returns for the year show a considerable increase in all the branches of the ordinary revenue except in the Stamps and Taxes; while, in the Quarter's returns, the only branch which shows a decrease is the Miscellaneous item, which scarcely affects the sources of revenue derived from the prosperity of the people.

Home News.

Court.—Her Majesty, the Prince of Wales, and the Princesses, left town on Wednesday for Windsor Castle, accompanied by the King and Queen of the Belgians, King Leopold having arrived at Buckingham Palace on Tuesday evening from Ostend. Prince Albert arrived at Cologne on Saturday evening, and immediately proceeded to Gotha, which he expected to reach early on Sunday morning. Notice has been issued from the Lord Chamberlain's Office, that Her Majesty will hold Drawing-rooms at St. James's Palace, at two o'clock on Thursday the 18th inst., and on Thursday the 25th inst., to celebrate Her Majesty's birthday. It is rumoured that the contemplated visit of King Louis-Philippe to this country will take place early in June, and that His Majesty will be accompanied by the Queen and the Prince and Princess de Joinville. Major-General Wemyss has succeeded Colonel the Hon. C. Grey, as Equerry in Waiting on Her Majesty. Several changes have taken place in the Royal Household within the last fortnight, by which the expenses of the establishment have been reduced by some hundreds of pounds annually. Thursday being Maunday Thursday, Her Majesty's annual distribution of Royal charities took place in Whitehall Chapel. The Royal Gate alms were distributed on Monday and Tuesday, to upwards of 800 poor and aged persons.

Illness of Lord Abinger.—On Monday evening Lord Abinger was suddenly attacked by paralysis at Bury St. Edmunds, whilst entertaining the magistracy of the county after the business of the Assizes in the Crown Court. It appears that whilst the Judges were entertaining the Magistrates at their lodgings, just as dinner was concluded, Lord Abinger suddenly became indisposed, and deprived of the power of speech. He was able to walk down stairs to his sleeping apartment, and was assisted to bed, the services of Dr. Probert, who was dining with their Lordships as a Magistrate, and Mr. Image, being immediately rendered. The most powerful measures were resorted to, but the paralysis extended down his Lordship's side, and he remained during the night in a state of almost total unconsciousness, but at one period made an effort to get out of bed, and fell down in entire prostration. Lady Abinger, and two of his Lordship's sons were sent for, and Mr. Bransby Cooper left town for Bury as soon as the intelligence reached him. The last accounts represent his Lordship as in a most alarming state. He appears at times as if conscious of what is passing in the room, but has not spoken since he was attacked. Mr. Bransby Cooper remains at Bury, and it is understood that he does not give the slightest hopes of the learned Judge's ultimate recovery.

The Revenue.—The returns of the Revenue for the year and quarter ended the 5th April, have just been published. The returns for the year show a total Income of 50,396,977*l.* Of this sum the Customs make 19,458,129*l.*; Excise, 11,889,123*l.*; Stamps, 6,472,040*l.*; Taxes, 4,192,473*l.*; Property-tax, 5,356,887*l.*; Post-office, 622,000*l.*; Crown Lands, 147,500*l.*; Miscellaneous, 1,134,477*l.*; Imprest and other moneys, 205,865*l.*; Repayments of Advances, 972,483*l.*; making the total sum of 50,396,977*l.*; and being an increase over the last corresponding year of 4,318,167*l.* There is an increase in the Customs of 658,335*l.*; Excise, 474,607*l.*; Property-tax, 2,900,599*l.*; Post-office, 15,000*l.*; Crown Lands, 30,000*l.*; Miscellaneous, 336,703*l.*; which, with Repayment of Advances, 215,425*l.*, give a total of 4,700,669*l.* From this must be deducted a decrease in Stamps, 12,699*l.*; Taxes, 73,064*l.*; Imprest and other moneys, 296,739*l.*; making the sum of 382,502*l.*, which being deducted from the increase, as above, of 4,700,669*l.*, gives a total increase on the year of 4,318,167*l.* The returns for the quarter show an increase of 325,034*l.* The increase in the Customs is 384,910*l.*; Excise, 85,316*l.*: Stamps, 45,885*l.*; Taxes, 1987*l.*; Property Tax, 107,627*l.*; Post Office, 30,000*l.*; Crown Lands, 30,000*l.*; Imprest and other moneys, 37,337*l.*; Repayments of Advances, 102,236*l.*; making a total of 825,298*l.* From this the only item to be deducted is a decrease in Miscellaneous of 500,264*l.*, leaving a total increase on the quarter of 325,034*l.*

Parliamentary Movements.—The election at Hastings has terminated in the return of Mr. Brisco, the Conservative candidate. The numbers were, for Mr. Brisco, 513; for Mr. R. R. Moore, 174. Majority 339.

Diplomatic Appointments.—It is announced that Lord Stuart de Rothesay, her Majesty's Ambassador at St. Petersburgh, has resigned his mission, and that the Hon. Mr. Bloomfield has been nominated Minister Plenipotentiary in Russia. It is not intended to replace Lord Stuart by any diplomatist of the rank of ambassador, as the representative of Russia at this Court, Baron Brunnow, holds only the same diplomatic rank as the Hon. Mr. Bloomfield is now invested with.

The Army.—The Rev. G. R. Gleig, Chaplain of the Royal Hospital, Chelsea, has been appointed Principal Chaplain to the Forces, vice the Rev. W. W. Dakins, D.D., who retires; the Rev. R. W. Browne, M.A., to be Chaplain to Troops stationed in London.

Foreign.

France.—The proceedings in the French Chambers have been entirely of domestic interest. The Government was defeated last week on one of the principal clauses of the Recruiting of the Army Bill, the details of which have been for some days the subject of warm discussion in the Chamber of Deputies. The Government had proposed that eight years be fixed as the time of service in the army; the Chamber decided by a majority of 170 to 163, that seven years should be the period. To this vote no importance is attached as regards the existence of the Cabinet, as M. Thiers and other opposition members voted on the occasion with Ministers.—The proposition of M. Garnier Pages, relative to the conversion of the Five per Cent. Stock into Four and a Half, was examined in the *bureaux* of the Chamber on Friday. The Minister of Finance said that he did not oppose its being publicly read, but that he would resist its being taken into consideration. The other Ministers made a similar declaration. Seven *bureaux* out of nine decided that the proposition should be read at one of their next sittings, and it was accordingly brought forward on Tuesday. After a debate of two days the motion was negatived by 207 to 163. M. de Lamartine presented a petition to the Chamber of Deputies on Wednesday, praying that Don Carlos and his Royal family, now detained at Bourges, might be set at liberty. This petition had, amongst the names of several distinguished persons attached to it, that of M. de Chauteaubriand. The petition is the composition of M. Madrolle, who published some time since a pamphlet termed "A Manifesto for Princes," in which the principal points are developed, and it is said that the petition will be warmly supported by the different sections of the Opposition.—The excitement got up by the clergy on the subject of education is becoming every day more alarming, and gives great uneasiness to the Government. On Saturday the Minister of the Interior received despatches from the Prefects of Morbihan and Finisterre, which give a most unsatisfactory account of the state of these provinces. The smaller clergy are doing all they can to excite the people, and a great number of instances are given in which the priests interrupted divine service to harangue the people on the attempts made to destroy religion, and oblige their parishioners to sign protests against the Education Bill which is now before the Chamber of Peers. The Government is placed in a complete dilemma by these demonstrations, and it is difficult to say how the conduct of the clergy will be met.—On Saturday the Government presented two grand Railway Bills to the Chamber of Deputies. One is to run from Paris to Dijon and to connect itself with the railway constructing between the latter city and Châlons; the other is to run from Tours to Bordeaux, and thus complete the line intended to connect Bordeaux and Paris. "The former," says the *Journal des Débats* "is called the railway from Paris to the Mediterranean, and the latter the railway from Paris to the frontier of Spain. The Dijon railway is to be conducted through the valleys of the Seine, Yonne and Armançon. The whole sum allotted to it is 50,000,000f., 40,000,000 of which to be expended in 1844, and 10,000,000 in 1845. The company that may engage to lay down the rails and supply the *matériel* will have a possession of but 30 years at the utmost; its lease will include the entire line from Paris to Châlons. The sum allotted to the Tours and Bordeaux line is 54,000,000f., the same portions as above to be expended in 1844 and 1845. Its course is to be the same as that of the present road which runs through Chatellerault, Poitiers, and Angoulême. The company that may take it will have the lease of the whole distance of 120 leagues between Orleans and Bordeaux. The distance from Orleans to Tours will be conceded to it as a premium, in the way of a compensation for the part of the railway between Tours and Angoulême, which is generally expected to yield very little. The concession is to last forty-seven years. It is understood that if no suitable company should present itself within two months to subscribe the stipulations, the State itself will lay down the rails from Orleans to Tours." The *Siècle* states that a Bill is also shortly to be introduced for a railway from Paris to Strasburg, on terms similar to those proposed for the Bordeaux line.—The papers announce the *accouchement* on Thursday of the Princess of Saxe Coburg Gotha (Princess Clementine of Orleans,) who on that day gave birth to a son. The infant was christened in the evening, by the Archbishop of Paris, by the names of Philip Ferdinand Marie Auguste Raphael. The sponsors were the King and Queen of the French.—The *Revue des Deux Mondes* doubts if King Louis-Philippe will visit England during the summer, as reported. "Some foreign newspapers," says the *Revue*, "have adopted, a great deal too lightly, the report of the King's journey into England in the course of the approaching summer. The age of the Monarch excused him from a visit to which he was strongly urged by his sons. The journey now spoken of, not being required by any expedience, will be altogether of a political character; and, whatever the sentiments of the ministry may be on the English alliance, we believe it to be too enlightened to expose the head of our new dynasty to an ovation more annoying to him than the clamours of his most implacable enemies."—The weather in Paris has undergone a sudden change during the past week, and is described as unusually warm and brilliant for the season.—The subscription for the sword of Admiral Dupetit Thouars, amounts to nearly 360*l.*

Spain.—The accounts from Madrid are mostly taken up with details of the festivities in honour of the return of Queen Christina. As we stated briefly in our last, on the authority of the telegraph, the Queen-Mother, accompanied by her two daughters, made her entry into that capital in the afternoon of the 23d. Their Majesties were received at the gate of Atocha by the municipality and the civil and military authorities. Several dances were there performed in their presence by 18 young girls, richly dressed, who formed the retinue of a woman seated on a throne under a canopy representing a rainbow, the symbol of peace and happiness. Their Majesties afterwards offered a short prayer in the Church of Atocha, and then entered the city, Generals Narvaez and Mazaredo, the Minister of War, riding on each side of the open caleche in which they sat. Queen Christina acknowledged the "*Vivas!*" of the population, and her reception on the whole was satisfactory. After their Majesties had reached the Palace, the troops defiled under the balcony, and in the evening the city was illuminated. The *Gazette* announces that the Queen, in honour of the event, had ordered that a month's pay be given to the officers of the Government and the pensioners of the State throughout the kingdom. On Sunday the two Queens, accompanied by all the members of the Royal Family now in Madrid, assisted at a "Te Deum," which was performed in the church of St. Isidoro; and in the evening they attended the theatre of Santa Cruz. Don Francisco de Paula and Queen Christina exchanged visits in the course of the day. On Tuesday there was a grand reception, at which the Ministers of State, the diplomatic body, and the other great functionaries were presented. Senor Arguelles late guardian of Queen Isabella and one of the most distinguished statesmen of Spain, died at Madrid on the 23d; his funeral took place on the 25th, and was attended by the entire population of the capital.—Carthagena surrendered at discretion on the 25th, and a general amnesty is talked of at Madrid, excluding however Don Carlos, Espartero, Cabrera, Olozaga, and the Bishop of Leon. The *Castellano*, which mentions the rumour adds that, considering the state of the country, it cannot believe it to be founded. In the meantime the Madrid Ayuntamiento are collecting into a volume which is to be superbly bound, all the poetical pieces composed in honour of the return of Queen Christina.

Portugal.—Accounts from Lisbon to the 26th inform us that the 400 insurgent soldiers are still in possession of Almeida. The preparations for attacking them are not yet completed, and the artillery had not arrived at that place. A representation of the perils which the interests of the crown and of the country were said to be menaced with in consequence of the continuance in power of the Cabral ministry, signed by three ex-ministers, intended to be presented to the Queen of Portugal, was delivered to the King, her Majesty declining to grant an interview to the nobleman appointed to present it, the Count de Lavradio. An explosion of subterraneous water took place lately in the district of Vizeu, by which the soil was torn up, and earth and stones flung to a great height into the air, for the distance of more than a league, between the small river Oleiros and the Douro. All the cultivated land over which the explosion passed was destroyed, and in many places it created ravines 40 feet in depth, and 30 fathoms wide. It carried away and shattered to fragments in its course, which was of extreme rapidity, no fewer than 50 wind and water-mills, choked the Douro with rubbish, and caused the death of nine persons, including one entire family. The loss to the farmers and labourers is calculated at 60 contos, or 14,000*l.* On the same day a

similar explosion took place in the mountain of Marcelim, in the same district, arising from the same source, but branching off in the direction of the river Bastanza. It carried away a farm-house, four cows, and some sheep and goats. A subscription has been opened at Vizeu for the relief of the sufferers from this catastrophe. A similar occurrence took place here last year and the year before, and 18 months since in Madeira.

GERMANY.—Letters from Munich announce the death, on the 18th ult., of M. Jean Baptiste Stiglmayer, director of the Royal Foundery of Munich, in the 52d year of his age. This distinguished engraver, painter, and sculptor, carried the art of casting metals to the highest point it had ever reached in Germany. The monuments of colossal grandeur for which the Germans are indebted to him, amount in number to 193, amongst which figure in the first rank the equestrian statues of Maximilian I. of Bavaria, and the Electors, his predecessors, which have been all gilt; the obelisk erected at Munich, in commemoration of 30,000 Bavarians killed in Russia; the statues of Schiller, Jean Richter, Mozart, Beethoven, Bolivar (for Bolivia), and last, the statue of Goethe, who was the intimate friend of Stiglmayer, and at the execution of which the latter, although ill, worked with so much ardour, that two hours after the cast was terminated, and even before the mould was broken, he expired in the arms of his assistants.—A letter from Posen, March 18, in the *Augsburg Gazette*, says:—"The Government has given the Polish emigrants permission to prolong their stay in the province until they have terminated their affairs—those at least relating to their property. As the Government has not named the period at which the emigrants must be ready to quit the province, hopes are entertained that they will be allowed to remain indefinitely, provided they be quiet and avoid all political matters.—The *Frankfort Journal* states that the plan of the railroad line all the way from Berlin to Cologne is decided, which will unite the Prussian capital to Ostend in 1847. The distance between Berlin and Cologne is 97 German miles, which will require 26 hours to perform.

DENMARK.—Letters from Copenhagen of the 25th, announce the death of Albert Thorwaldsen, one of the most amiable men and the greatest sculptor of the present day. It appears that on the previous evening he went, as was his custom, to the theatre. Before the commencement of the performance he suddenly fell back in his seat, and was carried out, and soon after breathed his last. He was born on the 19th November, 1770, and was consequently in his 74th year. To the last day of his life he preserved his activity and cheerfulness of spirits, and he was engaged on some important works, among which may be mentioned the colossal statue of Hercules, for the Palace of Christianburgh. On Saturday, the 30th of March, the mortal remains of the great master were interred in the Holm Church. All he died possessed of he has bequeathed to the Thorwaldsen Museum; but, with the exception of his works of art, his property is not so great as was imagined, for his generosity in assisting poor and deserving artists was unbounded. He had been working on a bust of Luther on the day of his death. His loss will be deeply felt among the artists of Rome, whom he had endeared to him by his many virtues. Perhaps no man of equal eminence in art ever enjoyed the esteem of so many friends in every country of Europe.

ITALY.—The recent outbreak at Cosenza, in the kingdom of Naples, and the unusual excitement among the Italian refugees in the great European capitals, are the chief topics of the political circles, and are considered to prove that the disturbances, so far from having been put down, are only in their commencement. Throughout the whole of the Italian states, both in the south and the north, the people have been for a considerable time in a state of the greatest ferment and excitement, and the present outbreak in the kingdom of Naples is but the first ebullition of that feeling. In the Papal States it is well known that the people are in a state almost of anarchy; and so slight is the power of the Government, that it is utterly unable to suppress the most open outrages. At Bologna, a military commission has been sitting for months, which has condemned nearly a hundred individuals to different degrees of punishment, from simple imprisonment to death itself; but those examples have not had the expected effect, and the people are now more daring and determined than ever. In the Sardinian states similar demonstrations have taken place, and bands have united in the mountains which spread terror everywhere. For some time it was held out that these disturbances had their origin in the distress of the people, and not in political causes; but the rank and wealth of many of the parties compromised, and the significant shouts for liberty and a constitution, with the display of the tricolored flag, make it impossible any longer to doubt that political feeling is at the bottom of the movement. A variety of rumours are abroad as to the intentions of Austria to interfere in favour of the Italian governments, by marching an army to Rome and Naples to their assistance. By some it is said that both the King of Naples and the Pope have demanded assistance from the Cabinet of Vienna, which hesitates what to do. Others say that Austria has offered assistance, which has been accepted by the Pope, but declined by the King of Naples. The French papers however leave no doubt of the fact that any intervention on the part of Austria would be met by a French occupation of Ancona, and another probably of Civita Vecchia. A letter from Rome of the 16th ult. states that that city is in a state of great excitement, and that along the frontiers of the Papal States small forts have been erected at short intervals. This measure would appear to have been taken in consequence of advice that a party of Italian refugees intended to make a descent upon some point or other of the Peninsula, and had actually embarked on board three ships from Malta. For some time past, in fact, the French and other European Cabinets have warned all the Italian Governments to beware, and that the refugees had formed the plan of a monster conspiracy for the purpose of revolutionising the whole country in the spring. Another pontifical measure, it states, has caused universal alarm; the Government having printed, distributed in profusion, and posted up in all the streets, an edict, which announces in the most desponding terms that new and the greatest dangers threaten the Church. This edict orders public prayers; invites the people to repair to the temples to implore the Holy Virgin, who is the special protectrix of Rome; in short, enjoins a Triduo in her honour, to supplicate her to conjure the storm. The outbreak at Cosenza appears to have been effectually suppressed, but not without the loss of four soldiers and the Commanding officer, who was the son of the celebrated metaphysician, Baron Galuppi. The movement however has extended to Paola, a town of 5000 inhabitants on the coast of the Mediterranean. Several soldiers have been killed, and among them one of the colonels in command. The King has sent a numerous force into Calabria; the towns in that district are consequently kept quiet, but the mountainous districts were occupied by bands of insurgents. Additional arrests have taken place at Naples. According to the *Leipsic Gazette*, a great ferment still prevailed at Ravenna and Bologna, and violent uproars had taken place at Faenza and Rimini. At the former place the populace had killed the Pope's carabineers, and mangled their corpses. The *Augsburg Gazette*, of the 24th, states that a few days previously another attempt at insurrection was made at Imola. It was put down, and several of the rioters were arrested. Some were wounded, and others saved themselves by flight.

TURKEY.—Accounts from Constantinople of the 13th ult. announce, that on that day the Porte delivered a reply to the note of the British and French Ambassadors respecting the execution of relapsed renegades, which was believed to be of an unsatisfactory nature. M. de Coq, the Prussian Minister, has received instructions from his Government to support the English and French representatives in their demands. An attaché to the Russian embassy had been suddenly sent with despatches to St. Petersburgh. The object of his mission was not known, but it was generally believed that it had reference to the important question now agitating at the Porte.—Letters have been received from Bucharest dated the 8th ult., which state that a grave misunderstanding had arisen between the Prince of Wallachia and the national assembly. It appears that Prince Bibesko had entered into an agreement with a *pseudo* company of Russians for the working of mines in the principality for the space of 12 years. A large body of Russian engineers in the service of the Government immediately crossed the Wallachian frontiers, and the power of entering upon and examining all the lands, both of the Boyards and others, was conferred upon them. It turned out that the Russian Government was the pretended Company that took the lease of the mines. The Wallachians made no objection to the mines being let to a Russian Company, but when the labourers arrived, their astonishment was so great to find that the pretended workmen were a regiment of Russian sappers and miners, that the Assembly of the States annulled the contract on the ground that the Government had exceeded its powers.

INDIA AND CHINA.—The India mail of the 1st of March arrived this week, with accounts of considerable importance. The great result of the late victories near Gwalior has been the tranquillisation of India. Gwalior has been settled, a new treaty has been formed, the young Sovereign has been placed on the throne, a contingent has been raised and placed under the care of British officers, the old unruly troops of Scindiah have been disbanded, the Governor-General was proceeding to Calcutta, and the Commander-in-Chief to Simla; the supremacy of the British Government being admitted by all the inhabitants. Yet there were sources of dissatisfaction, but they were principally confined to the conduct of some of the Bengal and Madras Sepoys in the 64th and 34th Bengal regiments, and in the 47th Madras Regiment of Native Infantry, who had shown a rebellious disposition on being ordered to serve in Scinde. Courts-martial were to be held on the ringleaders, and the strongest determination was exhibited to suppress this insubordination in the troops of those two presidencies, which, however, appears to be confined to the regiments ordered to Scinde. The great point of interest in Indian politics was Lahore, where every prospect exists of another revolution breaking out in the course of a few months. Heera Singh, the Prime Minister, was busy in plundering the Royal Treasury, and removing the spoil to the fastnesses of his family in the mountains. The boy King, Dhuleep Singh, was placed on the throne in January, in the midst of great pomp, but the celebrated diamond, "koob-i-noor," which Runjeet Singh had plundered from Schah Soojah, was not produced on the occasion. It is said to have been sent to the mountains. There was an expectation entertained that Heera Singh would in a short time without scruple have the boy King sacrificed and himself placed on the musnud. The British were collecting a large force on the banks of the Sutlej, in order to be prepared for every emergency, and the Commander-in-Chief of India was to be stationed in the neighbourhood at the mountain residence of Simla. The news from the Affghan countries was, that Yar Mahomed had expelled the Suddozies, or sons of Schah Kamram, from Herat, and that he had declared himself the ruler, and that under the protection of Persia he was endeavouring to form an intimate junction between himself, the Sirdars of Candahar, and Dost Mahomed of Cabul, to whose notorious son Akhbar he had offered his daughter in marriage: the offer was accepted, and a sort of confederacy was formed. The hatred between the Affghans of Cabul and the Sikhs is likely to produce a quarrel; for the former desire ardently to obtain Peshawur, and all the districts to the west of the Indus. In Scinde there was no disturbance, for Sir Charles Napier continues to keep up the Army of Occupation to 15,000 men. The sickness is described as diminishing, and the prejudice against the occupation had abated, although the dissatisfaction of the Bengal and Madras soldiery on being ordered there was still very great. Sir C. Napier continued in good health. There was a grand ball given to him at Kurachee, on the anniversary of the battle of Meeanee. He was making preparations for proceeding to the northward. Sir Robert Sale, who went some months with Her Majesty's 13th Regiment to Sukkur, was expected in Bombay in the month of March, accompanied by Lady Sale and his daughter, Mrs. Sturt. This gallant officer has obtained leave to visit England. The settlement of the Mahratta Government at Gwalior appears to be complete; the soldiers who formerly served the Government, on being disbanded, immediately joined the contingent. Their Government has paid about a quarter of a million for the expenses of the late war, and ceded certain possessions lying between their territories and Bundelkund, which will have the effect of obliging the refractory chiefs in those districts to submit to the terms proposed by the Supreme Government. Arrangements were made to compensate the Ryots for any injury done to their crops and fields by the march of the British troops. This was a most unusual proceeding in that country, and had given great satisfaction; and the inhabitants, in expectation of a better rule hereafter, were highly pleased with the moderation of their British conquerors.—The news from China comes down to the 12th January, but it presents nothing of remarkable interest. The mercantile arrangements were going forward to the satisfaction of the British and Chinese authorities. It now becomes a matter of great interest to the British commercialists to endeavour to supply the Chinese markets with good articles. The active and intelligent Chinese, who are now learning the value of cotton, &c., whether raw or manufactured, will not long submit to be imposed on by second-rate articles of any kind. Sickness prevails at Hong-Kong, and several Europeans were carried off. Inquiries into the cause were making by Sir H. Pottinger, through the aid of a medical committee appointed for the purpose. The massacre of the Bishops Jmbert, Messrs. Chastan and Manban, with 70 Christians, all Roman Catholics, at Corea, is confirmed by the *Friend of China*. The same paper adds, that in addition to the above, who were all beheaded, 180 other Christians were put to death by strangulation. Major-General d'Aguilar arrived in H.M.S. Castor, on the 27th December, and was to take the command as the Commander-in-Chief of the British forces in China. H.M.S. Cornwallis, having Vice-Admiral Parker on board, arrived at Singapore on the 11th Jan.

UNITED STATES.—We have accounts from New York to the 11th ult. Mr. Calhoun has been appointed Secretary of State by President Tyler, in the place of the unfortunate gentleman who previously held the office, and who was killed by the explosion of the Princeton's gun. In the earlier stage of Mr. Tyler's Presidency the same office was offered to Mr. Calhoun and declined, as he then had hopes of succeeding to the presidency himself. The recent turn which events have taken for that office, by placing Mr. Van Buren at the head of the democratic party by a large majority over Colonel Johnson and General Cass, has mainly, it is said, influenced Mr. Calhoun in the selection of an inferior but still important office. The death of Mr. Biddle the well known financier took place on the 27th Feb., at Andalusia.—Arrivals at New Orleans bring intelligence that the Mexican Government has approved of the arrangement made by their Minister in London, so that all difficulties with England will be arranged. Mr. Bankhead, the new British Minister, had not arrived. The February instalment of the indemnity to the United States has been paid.—The Canada papers state that an amnesty has been received from the Home Government, pardoning all Canadian rebels, but not extending that pardon to strangers.—Montevideo advices inform us that the French Consul at that port had demanded that all Frenchmen banded for the defence of Montevideo should be disarmed. This the Oriental Government refused, and the French Consul-General thereupon struck his flag, and retired on board the French frigate La Gloire.—A vessel had arrived from the West Indies, which brings a report that a severe earthquake shook the island of St. Vincent on the 27th January, and did considerable damage.

Parliament.

HOUSE OF LORDS.

Monday.—The Earl of RIPON stated, in reply to the Earl of Malmesbury, that troops had been sent from New South Wales and Van Diemen's Land to New Zealand to aid in its protection. At the same time, the Government felt that great inconvenience attended the moving of troops from one colony to another, and considered that New Zealand, as it had the power by law to levy militia or constabulary, ought to provide for its own security.—The Earl of ABERDEEN laid on the table the supplementary treaty with China, containing the regulations for the conduct of our trade, and, in doing so, remarked that the northern parts of China were now open to British commerce, and, he was happy to say, with every appearance of the most extensive and successful trade—a trade that was carried on with the greatest good feeling on the part of the people of the country, and with the best feelings towards her Majesty's subjects. His Lordship also paid a high tribute to the various services performed by Sir H. Pottinger.—Lord BEAUMONT called attention to the state of our commercial relations with the Sublime Porte, for the purpose of showing that our commerce, as regulated under the convention

of 1838, had suffered greatly by a subsequent treaty entered into between Turkey and Russia, by which Russian merchants were placed on a much more favourable footing than ours.—The Earl of Aberdeen replied that if Russia was really placed on a more advantageous footing than us, we were entitled, by the first article of our treaty, to be put on the same footing; but not one of our Consuls recommended us to seek such a favour. In fact, instructions had been recently sent to the Russian Minister at Constantinople to negotiate a treaty of commerce for Russia, accepting the basis of the British treaty of commerce, and the Government here hoped that negotiation would soon be brought to a successful issue.—The Ecclesiastical Courts Bill was read a third time and passed, after renewed protestations against the retention of the Diocesan Courts by Lords Denman, Cottenham, and Campbell.—The International Copyright Bill passed through committee.

Tuesday.—The Royal assent was given, by commission, to the Mutiny, the Marine Mutiny, and the Annual Indemnity Bills.—Lord Monteagle brought in a bill to alter the law relating to forestalling markets in Ireland, which was read a first time.—Lord Campbell laid a bill on the table, to enable parties convicted, who may have moved the proceedings by writ of error to the House of Lords, to give bail and be at large pending the final judgment on their case. The House, on its rising, adjourned till Tuesday, the 16th April.

HOUSE OF COMMONS.

Friday.—On the motion for discharging the order of the day for proceeding with the Factories Bill, Mr. Cochrane expressed his regret that Lord Ashley should have shrunk from maintaining his ground, and thereby gave the Government the advantage over him, not only in success, but in apparent earnestness and sincerity. The object of bringing in a new Bill, identical with the old one, was to gain time; there was little chance after Easter of carrying a 10-hours clause. Lord Ashley should have recollected that "whoever puts his hand to the plough should not look back." But by permitting the Government to bring in their new Bill, he was "keeping the word of promise to the ear, but breaking it to the hope." The supporters of the 10-hours clause had been appealed to by Lord Ashley in solemn, almost unusual terms, to stand by him; and now after staying in town to do so, they were told that he would decide after Easter on the course he should adopt. This arose he believed from no insincerity but a want of decision and determination.—Mr. T. Duncombe participated in the regret expressed by Mr. Cochrane. Sir J. Graham had stated that there were three courses open to them consequent on their defeat: but he forgot that there was a fourth, namely, instead of withdrawing the Bill to withdraw themselves, which would give great satisfaction to the country. The Home Secretary was like the Captain of a West Indiaman which was freighted with cheeses and grindstones; though the cheeses were in much request he refused to sell them without the grindstones. There sat Sir J. Graham, who refused to give them a Factories Bill without the 12 hours. It was urged that the true remedy was the repeal of the Corn-laws: but if they were repealed to-morrow, the restriction of the hours of labour would be the more necessary. To prevent if possible the stultification of the House he moved an amendment, which in substance pledged it to maintain the principle of the 10 hours.—Lord Ashley explained that he had been advised by Members on both sides of the House, and his own judgment concurred in it, to adopt his present course as the best for the question. The bill, as it now stood, was reduced to a mass of confusion by the different divisions; and if he had taken a debate at the present stage, it would have been on mere technicalities instead of some intelligible issue. He would inevitably have been defeated, and the defeat would have been misinterpreted throughout the country. It had been imputed to him that he had been actuated by interested motives; he denied it, and declared that he would maintain the question without reference to the feelings or the fate of any Government whatsoever. Thanking both sides of the House for the continued and unmerited kindness with which he had been always treated, he once more called on the supporters of the principle of the ten hours to stand by him in his future advocacy of it.—Lord Howick considered that the Government were pursuing an extraordinary course, by bringing in a new Bill, similar in all its main provisions to the old one, and thus bringing back the House to the point from whence it had started before the divisions on the question of the ten hours. The more natural and usual course would have been the re-committal of the present Bill. Compromise had been repudiated; yet the adoption of the "eleven" hours might have been a convenient middle term, and would have enabled them to make the experiment to what extent the reduction of the hours of labour would have been accompanied by a fall in wages. But at the present stage of the proceedings, he thought it better not to offer any opposition to the withdrawal of the Bill, and the introduction of the new one.—Sir R. Inglis opposed Mr. Duncombe's amendment. He felt convinced that Lord Ashley had exercised a wise discretion in not resisting the withdrawal of the Bill; for if it had been abandoned by the Government, and had fallen to his management, he would have been beaten, if by no other means, at any rate by delay.—Mr. Acland said, if any Honourable Members were prepared to place another Secretary in the Home Office, they might continue to stand out for a ten hours Bill; but if they did not intend to go to that length, they were to blame to advance to the very walls, and then resign their arms. If they wanted a change of Government let them go on. Without it he thought it impossible to carry a ten hours Bill, and this was a price which he was not willing to pay.—Lord J. Russell stigmatised the course adopted by the Government as, though the most convenient for themselves, a heavy blow to the authority of the House. It would be impossible that the House could frustrate its three separate decisions against a twelve hours limitation, and consent to the introduction of a new Bill containing a twelve hours clause, without shaking its authority in the estimation of the people. Should Lord Ashley persevere in opposing the withdrawal of the measure, he should support him, though he believed he acted wisely in not exposing the question to the chance of a minority. He considered this one of those questions upon which the opinion of the House, expressed by its majorities, ought to prevail, and that the stability of the Government ought not to have been staked on it, as it had been. If the House of Commons voted a want of confidence in the Executive Government, there could be no doubt as to the course for a Government to pursue. But on questions that affected large bodies of the people, he hoped that the House will maintain their legislative authority, and never submit to be made the puppets of any party.—Sir R. Peel agreed, but pleaded that members of the Government had also *their* responsibilities as members of the Legislature. The Opposition, which now taunted the House with yielding to the wishes or the opinions of the Government, were in the habit of reproaching the Government with yielding their own opinions to the wishes of the House; of which an instance was afforded by the Ecclesiastical Courts Bill. It was the habit of the House of Commons, as a deliberate assembly, to permit repeated considerations of a question, and to weigh well all the consequences of a proposition; and there were repeated instances of the benefit arising from the caution which waited on new lights. They were told that they were sanctioning the principle of interference, by adopting the principle of twelve hours; but in doing so, they had but adopted what they had reason to believe was the unsound precedent of former legislative measures in interfering with labour; and the way to correct it was certainly not to carry interference further than was expedient or safe. Had they adopted the compromise of the eleven hours, they would probably have had a majority in their favour: but it was not the wisest policy in a Government to free themselves from present difficulties, by adopting a principle which they conscientiously believed would be injurious to the permanent interests of the country. Lord Ashley had sacrificed office, because the Government would not sanction the principle of the ten hours. That fact, while it afforded a proof of the noble Lord's sincerity, also showed that the Government had maturely considered the question. For himself, he would rather adopt the ten than the eleven hours; but if there were any truth in arithmetic, or the principles of commercial interchange, the loss which would arise from the limitation of labour was proved would be thrown on the labouring population themselves. He hoped that farther consideration would bring round the House to this conviction.—Mr. C. Wood, as the representative of a great manufacturing constituency, approved of the conduct of the Government, and expressed his strong conviction of the injury which would arise to the labourer himself, from the adoption of the ten hours.—Lord Palmerston, feeling the importance of the House upholding its own decisions, would support the amendment, if pressed to a division, simply in order to indicate to the country the feelings of members.—Mr. Williams, though concurring in the amendment, urged Mr. T. Duncombe to withdraw it.—Mr. Fielden spoke a few words, and then the amendment was negatived without a division. The order of the day for proceeding with the Factories Bill was then discharged.—On the motion for going into committee of supply, Mr. Ewart renewed his motion (on which the House was counted out the other evening) for the reduction of the duties upon raw materials, especially cotton and wool, as the only means of enabling this country to compete with France, Germany, and America, where there were no duties on those articles.—After a discussion, the House divided. For going into committee, 88; for the amendment, 24; majority, 64.—The House went into committee of supply, and the vote of 37,987*l.* for the British Museum was agreed to.—In the discussion upon this vote, Mr. Hume declared that the trustees were under no responsibility; the constitution of the board was not such as the public had a right to expect, and as long as it was a close body it would give dissatisfaction. He recommended that the Museum should be open on a Sunday, because then the people would be able to spend their time there instead of in public-houses, and this, in his opinion, would be the most effectual means for their moral reformation. He also recommended that children should be allowed to go in with their parents, as they were at Hampton-court and the National Gallery, instead of being kept out, in the custody of one parent, whilst the other went through.—Sir R. Peel said, with respect to the constitution of the board, he did not see that it was practically open to objection. The Duke of Sutherland, Mr. Hallam, Mr. William Hamilton, and Sir John Herschell were the last trustees appointed, and by any mode of election could they have better men? As to making the institution more accessible to the public, he found that in the year ending at Christmas, 1840, 247,000 visitors had been admitted, and during the year ending at the same period in 1843, 517,400 had been admitted. Thus, in the course of the three years, the number had been nearly doubled. If they took the reading room, the print room, and, in fact, all other parts of the establishment, they would see conclusive proof that the trustees had so far succeeded as to attract an additional number of visitors. With respect to children of tender age, he would only say that they wished to give the public all the information they could, but young children could not derive much instruction, and they surely impeded others who could.—Mr. Protheroe thought it was ill-judged economy to render the library, or any other part of the building of the British Museum, more complete at the present moment, for the time would come when some parts must be taken out and go to another repository. The birds and beasts and statues must go forth to a new erection hereafter to be prepared.—Mr. Bernal said that the allusion to a separate building for the reception of statues and paintings called to his mind the necessity which he had long felt to exist for a national museum of monuments exemplifying the history of the middle ages, which should embrace, in regular departments and proper classification, the history of the arts, and also the history of the country. In the British Museum they abounded in Egyptian relics, and specimens of various kinds from the South Seas, but of anything connected with the middle ages they were utterly deficient; and our artists, in the production of their plates, had no national resources to have recourse to. In France, the municipality had devoted a large sum to this purpose; and the Hotel de Cluny had been purchased by Louis-Philippe for the purpose.—Dr. Bowring said, the Right Hon. Baronet had not made any reference to the observation of Mr. Hume, as to the introduction of the public on Sundays. He had, however, stated, that he believed no country possessed institutions more accessible than the British Museum. He begged to say, however, that the Jardin des Plantes at Paris was more accessible at all times, and to the young as well as the old.—Sir R. Peel said, that in the last week the Treasury had had the gratification of authorising the expenditure of 2000*l.* to advance the objects of the British Museum—1000*l.* for preparing and cataloguing the collection of Zoology, made during the Antarctic voyage; and the remaining 1000*l.* for completing the Botanical collection, with the assistance of Mr. Brown, whose unobtrusive merit was not sufficiently known, but who had been the friend and companion of Sir Joseph Banks.—Mr. Warburton said the members of the Zoological Society visited their gardens on Sundays, and the British Museum was just as much the property of the British public, who ought to enjoy a similar privilege.—Mr. Wyse said that if a new gallery were to be erected, such as had been referred to, in order to be complete, it should embrace not only one age, but several ages apart; and if it was possible to combine a sculpture with a picture gallery, it would be a considerable improvement on the arrangements which existed in other parts of the world. He would beg to call the attention of the Right Hon. Baronet to another object, which was desirable in this country and in Ireland—in Scotland it had already been effected—namely, a collection of objects of art—the establishment of a gallery of casts, in order to guide the students and improve public taste. In Ireland such an institution had been attempted to be formed; but the projectors had not succeeded in obtaining a site. The Government, he hoped, would consider whether they ought not to give their aid to so desirable an object. If the country had no taste for works of art, it would be vain for the artist to struggle, when his labours could not be appreciated.—Sir R. Peel had no wish to do anything which would in the least degree discourage local art, but he thought that the object which had been adverted to was well worthy of the attention of the Government, and it was a matter to be considered, whether assistance could not be given for this purpose.—Lord John Manners felt that that was a fitting occasion to allude to, and to strongly deprecate the destruction of some of the most ancient and singular remains of antiquity in the metropolis by the corporation of London and other bodies. He trusted that some such way would be found in this country as existed in France, and which there received the support of the Government, for the preservation of ancient national buildings and other remains of antiquity in that country. He thought that the Government should exercise their influence for this purpose. Perhaps by setting an example themselves, they might shame these modern Goths and Vandals.—Mr. Hume hoped that the trustees of the Museum would make some arrangement by which children of six or seven years of age might be admitted to visit that institution with their parents or friends. He also trusted that the Government would, without delay, exercise their influence with the trustees of the Museum, so as to make some regulations by which the Museum could be opened to the public on Sundays after divine worship.—Mr. Borthwick complained that the cathedrals in the metropolis were not open to the public on Sundays, as well as the other days in the week; and it was a matter deeply to be regretted that they were only open in the week days on the payment of fees. He was glad that something had been done towards the attainment of this object at Westminster Abbey; but he regretted to find that nothing had been done as regarded throwing open St. Paul's Cathedral.—Mr. Hume thought that steps should be taken to make it generally known that any one might obtain casts of the finest remains of antiquity in the British Museum, at the charge of the mere expense of making the casts.—A few votes of the commissariat estimates were then agreed to, when the House resumed.—Sir J. Graham brought in his new Factories Bill, which he stated would restrict the labour of children in silk, lace, flax, woollen, and cotton factories, to six hours and a half, and prohibit their being employed in the forenoon and evening of the same day. It would also regulate the power to be given to surgeons in certifying to the health and age of the children, and it would provide against accidents in certain kinds of machinery—giving power to the Secretary of State to institute prosecutions when accidents did occur. The Bill would also provide that adult females should not be permitted to labour for a longer period than twelve hours. The second reading of this Bill was fixed for the 22d April.—Sir J. Graham also brought in a Bill for the more easy recovery of small debts in County Courts, and likewise a Bill for the regulation of bailiffs.

Monday.—Capt. Harris took his seat for Christchurch.—Mr. Cobden gave notice for after Easter to move for a select committee to inquire into the effect of protective duties upon the national revenues.—Mr. Gladstone stated that Government had entered into communications with the different Powers having territories on the coast of the Mediterranean, with the object of inducing them to shorten the time of quarantine, and there was every prospect that those Powers would consent to a more limited period.—Mr. M. Sutton stated that the Government had not yet decided whether they should introduce a measure on the subject of turnpikes, confining it to South Wales, or whether they should extend it to the whole principality.—Lord Eliot moved for leave to bring in a Bill to amend the law relating to the registration and qualification of Parliamentary electors in Ireland. By this Bill it is proposed to introduce the system of registration established in England, with some modifications, giving to the Lord Lieutenant the power of dividing the counties into polling districts, in each of which the revising barrister shall hold an annual court, granting an appeal from the revising barrister's decision to the Court of Exchequer Chamber, and limiting the duration of the poll to one day for boroughs and to two days for counties. It is likewise proposed to place on the new register those persons who are on the present register, exempting them from liability to challenge during the remainder of the term for which the old register would have lasted. With respect to qualifications, the Bill proposed to establish the solvent tenant test, requiring that there shall be a clear yearly value over and above all rents and charges of 10*l.* The effect of the application of this test, it is computed by the Government, will be to decrease by 25,000 the present county constituency. To compensate for this decrease the Bill proposes to grant to all occupiers who are rated to the relief of the poor in the sum of 30*l.*, the right of voting. The effect of this franchise will, it is computed by Government, be to add 55,000 voters to the new registry—thus, after deducting the 25,000 struck off by the solvent-tenant test, increasing the county constituency by 30,000. The Bill also proposes to grant to the possessors of freeholds or leases for lives renewable for ever, of the clear yearly value of 5*l.* the right of voting; and this with the intent of encouraging the creation of a class of yeomen, or small independent proprietors, of which few exist at present in Ireland. The Bill likewise proposes to dispense with the necessity of actual occupation in cases of freeholds and leaseholds of the clear value of 10*l.* With respect to the qualification of voters for towns, the only alteration proposed by the Bill is to substitute for the numerous rates and taxes which the voter is now obliged to pay, the following, viz., the town rate for lighting, paving, &c., the poor rate, the borough rate, and the police rate.—Lord Eliot also moved for leave to bring in a Bill to alter and amend the Irish Municipal Corporation Act. By this Bill it is proposed to extend to Ireland the provisions of the English Municipal Registration Bill, and to give the right of voting to every inhabitant householder who shall have occupied for the space of three years, who during that time has been rated to the relief of the poor, and who has paid his rates and taxes. The Bill also proposes to limit the rates and taxes necessary for the municipal franchise to those necessary for the right of voting for Members of Parliament.—Mr. M. O'Ferrall objected to the 30*l.* occupation franchise as one which would be greatly under the influence of the landlords, and thought the new 5*l.* freehold franchise should be extended to 40*s.* freeholders. He approved generally of the principles of the measure, with the exception of the 30*l.* occupancy, and his chief regret was that the Government did not carry out their views to a sufficient extent.—Mr. Shaw believed the unwillingness to register at all in Ireland, in consequence of the system of agitation carried on there, was the cause of the limited constituency; and whether there was a 30*l.* or a 50*l.* qualification, it would have but little practical influence on the number of Irish voters.—Lord J. Russell considered the 30*l.* occupancy franchise as very objectionable, for however fairly such a franchise might work in England, where the tenantry usually gave their votes willingly to their landlords, it would act very differently in Ireland, where the tenants are usually opposed in politics to their landlords. He was also of opinion that the 5*l.* freehold franchise should be extended to 40*s.* freeholders in fee. Generally, he wished the Bill had been more satisfactory.—Sir R. Peel entreated the House to take time for consideration, and not prejudge the subject by precipitate declarations. He re-adduced some of the statements made by Lord Eliot, as to the nature of the Registration and Franchise Bill, and contended that the Government were giving evidence of their intention to act with fairness towards the people of Ireland.—Mr. French and Mr. Hume followed, the latter expressing himself pleased with the Bill, as a move in the right direction, but felt convinced that it was inadequate to satisfy the Irish people.—After some further discussion, leave was given to bring in both Bills.—On the question for going into committee of supply, Lord J. Russell called attention to Lord Brougham's Appellate Jurisdiction Bill, and hoped that it was not to be sent down to the Commons from the Lords at so late a period as to preclude its due consideration. He asked Sir R. Peel if he thought that there was a necessity for the appointment of a judge to preside over the Judicial Committee of the Privy Council, with a salary, and if it were true that an office not yet created had been three times offered to and refused by Lord Brougham.—Sir R. Peel was as free and unfettered as Lord J. Russell to exercise an independent judgment on the Bill, whenever it came before them for consideration. He reminded the House that Lord Cottenham had introduced a Bill to separate the judicial and political functions of the Lord Chancellor, and in which he had proposed a judge to preside in the Privy Council. The Government had offered to Lord Brougham the presidency in the Privy Council, under the impression that the Crown had the power to create such a judge, provided no salary were annexed to it. Lord Brougham did not think at that time such an appointment necessary, but he had since taken up the subject, though the Bill was not a Government measure.—Mr. R. Yorke thought this a very flagitious job, and if ever the Bill came down to them he would use every form of the House to throw it out.—The House then went into Committee of Supply. Among the votes was one of 112,190*l.* to defray the expenses of public works, the maintenance and repairs of public buildings, and to defray the expenses connected with the maintenance of Royal parks and gardens, &c.—Mr. Williams objected that a great deal of this money was expended under the direction of the Commissioners of Woods and Forests, and without any control whatever. In four years, from 1838 to 1842, the aggregate amount expended by the Woods and Forests was 686,000*l.*, making an average for each year of 137,000*l.* He objected that any large amount of money should be expended without public control.—The Earl of Lincoln, in reply to other observations by Mr. Williams, stated that the expense of maintaining Windsor Park was decreasing, while that of the parks in

the neighbourhood of London, which were almost solely devoted to the use and benefit of the public, were increasing, in consequence of the improvements constantly making in them. The expense of roofing and keeping dry was all the public paid of the ceiling on Marlborough House, and this for the last year amounted to the large sum of 100*l.* With respect to Richmond Park, the Hon. Member, if he visited it, would soon find boards announcing that the park would soon be opened to the public, much under the same regulations, and for the same hours as the other parks. While the late Lord Sidmouth lived, the Commissioners of Woods and Forests had made no application to him to give up privileges that were always exercised with so much kindness. Immediately on his death measures were taken to extend the enjoyment of the park more freely to the public. Her Majesty and the Duke of Cambridge expressed their full approval of the arrangement, and there would be no further limitation on the access to Richmond than to the other parks.—In answer to an Hon. Member, the Earl of LINCOLN stated that difficulties connected with the purchase of ground, &c., impeded the progress of Victoria Park.—The vote was then passed.—On the vote of towards expenses of the works of the new Houses of Parliament, the Earl of LINCOLN explained that the smallness of the sum applied for arose from the circumstance that, as the works proceeded, the workmen were obliged to confine their labours within a small space. The House of Lords might be prepared by next year for the reception of their Lordships, but this could only be accomplished by temporary fittings, and it would be a question whether it would be prudent for the sake of temporary accommodation to incur the considerable expense involved in it. The expense too was the least point to be considered. The parties most interested were their Lordships themselves, whose health might be materially prejudiced by going too hastily into a building which it would be impossible to finish so soon in warming, lighting, ventilation, &c. To prepare the house adequately by next session was a physical impossibility, but if their Lordships would waive their claim to have their house first built, there was every reason to hope that both houses might be ready by the session following the next. The vote was agreed to.—The next vote was 7000*l.* for waterworks &c. in Trafalgar-square; when Mr. HUME, having put questions as to how the supply of water for the fountain, &c. was to be procured, the Earl of LINCOLN stated that after ample deliberation and experiment it was considered that the most advisable method was to pump up the water from wells situated behind the National Gallery. Water would thus be obtained purer in quality and more plentiful in quantity than otherwise. It would not be wasted, but would be made to supply the public offices and the new Houses of Parliament. A saving to the public of 500*l.* a-year would thus be effected, as the cost of maintaining the wells would be not quite 400*l.* a-year, while the sum now paid by the public offices, &c. to the Water Company amounted to 904*l.* a-year.—The House then resumed, and the Chairman reported progress.—The report of the Committee of supply was brought up, and the several items confirmed.—Lord G. SOMERSET obtained leave to bring in Bills to amend the jurisdiction of the County and Chancery Courts of the county palatine of the county of Lancaster.—Mr. SHAW moved for a select committee to inquire into and report upon the importance of an early and complete trial of the atmospheric railway system.—Mr. GLADSTONE recommended the postponement of the motion until after the recess. As regarded the magnitude of the invention the question was a most important one, and it only remained to prove whether it could be applied to a more extended line than at present; but it was necessary that time should be given to ascertain whether the proprietors of existing railroads would consent to the experiment.—After a few words from Lord H. VANE in support of the motion, Mr. SHAW agreed to withdraw it.—On the motion of Mr. COWPER leave was given to bring in a Bill for the establishment of Charitable Pawn Societies.—Mr. FRENCH obtained leave to bring in a bill to amend the laws relating to the temporalities of the Church in Ireland.—On the motion of the Earl of LINCOLN leave was given to bring in a Bill to prevent the damages by fire to property.

Tuesday.—Lord J. RUSSELL took occasion to advert to the policy of Government, internal and external, whether in the management of their legislative business, or the disposal of the naval force with a view to the protection of our interests abroad. The House had manifested its loyalty to the Crown by freely voting the necessary supplies; but there was a rumour that but one ship of the line was to be left with our fleet in the Mediterranean; and though nothing might arise, still, with an insurrectionary nucleus forming in Italy, and the probability of Spanish interference in Morocco, he disapproved of this departure from our usual policy.—Sir R. PEEL, in reply, said that the disposal of our naval force was a subject which peculiarly belonged to the Executive under its responsibility, and acting on its own view of what was expedient for the interests of the country; and though, no doubt, Lord J. Russell, in that confidence in his own judgment which frequently was so just, might feel himself competent to "take command of the Channel fleet," he must beg of him to leave the matter in the hands of the Government.—Sir R. PEEL brought up the Supplementary Chinese Treaty, and said, as this was probably the last act of the diplomatic life of Sir H. Pottinger, he could not suffer the opportunity to pass without expressing his sense of the public services of that distinguished man.—Lord PALMERSTON concurred in the eulogium thus passed on Sir H. Pottinger.—The business was chiefly of a routine nature; and various motions on the paper, which were to have come on for discussion, were postponed till after the Easter recess.—It was agreed that the House, on its rising, should adjourn till the 15th of April.—Mr. GLADSTONE moved that the House resolve itself into a committee to consider the state of the law of partnership, with a view to providing for the following purposes, viz.:—"For the registration of joint-stock companies, and for conferring on such companies certain privileges of corporate bodies, subject to the payment of certain fees, and on certain conditions and regulations, and for preventing the establishment of fraudulent companies; for the regulation of joint-stock companies; for facilitating and improving the remedies at law and in equity, in reference to joint-stock companies, their members, directors, and other officers, whether *inter se* or in relation to persons not being members thereof, and for winding up the affairs of companies unable to meet their pecuniary engagements; and for enabling private partnerships to register the names of their partners, and to sue and be sued in the name of their firm." The right hon. gentleman said he proposed, in the first place, to bring the whole some influence of public opinion to bear on public companies, and for this purpose he would bring in a Bill to register all joint-stock companies, and in so doing he would render them all, to a certain extent, corporate bodies. He should propose another Bill to provide for the constitution of joint-stock companies. He proposed also to provide another legal remedy, not only for the public against such companies, but for the shareholders against the managers and directors. Lastly, it would be his duty to ask the House for leave to bring in a Bill for introducing certain modifications into the law of partnership as related to private persons. It was well known that private partnerships laboured to some extent under the inconveniences which limit joint-stock companies, as to suing under the name of the firm. This was an evil which called for a remedy, and he therefore proposed to ask for leave to bring in a Bill, allowing private persons associating in partnership to sue and be sued as a firm.—The House went into committee, and the resolutions were agreed to.—Various returns were agreed to; but some discussion arose on a motion by Mr. WYSE for copies of sundry documents connected with the making up the lists of jurors for the recent state trials in Dublin, one of the documents asked for being a copy of the notes of the Recorder of Dublin, Mr. Shaw, who objected to their production. The motion was modified and agreed to.—The remaining business was disposed of, and the House then rose for the Easter recess.

CITY.

Money Market, Friday.—This being Good Friday, all the public offices were closed. The Funds on Thursday gave the following quotations:—Consols 99¼; New Three-and-a-Half per Cents., 103⅛ to ¼; India Bonds, 87*s.* to 89*s.* ¾ pm.; Bank Stock, 201 to 202; Exchequer Bills, 71*s.* to 73*s.* prem.

GAZETTE OF THE WEEK.—BANKRUPTS.—J. GAMB, Long Melford, Suffolk, corn-dealer—J. S. CHRISTOPHERS, Leadenhall-street, City, merchant—J. C. JOHNSON, Laurence Pountney-hill, Cannon-street, City, merchant—J. BRADSHAW, Marylebone-street, Middlesex, woollendraper—W. BAIL, Goodge-street, Tottenham-court-road, cabinet-maker—J. F. GARNETT, Tooley-street, Southwark, hatter—W. BROWN, Wapping, Middlesex, victualler—G. MACDONELL, Mincing-lane, wine and spirit broker—T. WITSTANLEY, Laurence-lane, commission agent—F. J. H. MULLER, Addle-street, Wood street, furrier—S. BAIL, Liverpool, chemist and druggist—E. GIBSON, Kendal, Westmorelandshire, builder—T. ROBINSON, Leicester, wine-merchant—G. HAWKINS, Bristol, mason—P. PHILLIPS, Southampton-street, Covent Garden, printseller—F. J. PEGLER, Reading, Berkshire, woollendraper—J. KING, jun., Budge-row, tea-dealer—W. G. CLIFF, Chapel-yard, Cross-lane, High Holborn, and Ingatestone, Essex, coach-broker—N. BEARD, Beech-street, Barbican, leather-seller—A. J. SAGE, High-street, Whitechapel, chemist—G. H. D. LAWRENCE, Hornsey, merchant—J. BRIGHSHAW, Wandsworth, victualler—T. C. HODSON, Leominster, linendraper—M. DEVINE, Liverpool, grocer—J. BROWN, Weymouth, Dorsetshire, tea-dealer.

Metropolis and its Vicinity.

Royal Society.—On Saturday night the Marquess of Northampton, as President of the Royal Society, held his last *conversazione* this season, at his residence in Piccadilly. The attendance of Fellows was very numerous, above 350 being present.

Artists' General Benevolent Institution.—The anniversary dinner of this excellent institution took place on Saturday last, in the Freemasons' Hall, Sir R. H. Inglis, M.P. for Oxford University, presiding. From the report of the treasurer it appeared that the total investments of the Society in government securities amount to 12,400*l.* 12*s.* 4*d.*, that 855 cases have been relieved at an expenditure of 8646*l.* 7*s.* 10*d.*; and that during the last year 486*l.* have been distributed in donations, varying from 5*l.* to 25*l.* each, amongst 47 applicants, consisting of the widows and children of deceased and living artists, painters, engravers, architects, sculptors, &c., who in their latter years have been in poverty and want. The receipts during the same period amounted to 1036*l.*, and the donations of the evening in furtherance of the objects of the institution were announced at 505*l.* The usual toasts were given, and the proceedings were conducted to the satisfaction of all present.

Custom House.—It is announced that Mr. John Manning, Comptroller of Customs in the port of London, is about to retire. He was for many years one of the surveyors-general in that department of the public service, and he will be succeeded in this very lucrative office by Mr. Willimet. Mr. M'Vicar, landing surveyor in the port of London, has retired. The name of this officer has recently been before the public as a witness against persons charged with Custom-house frauds.

Embankment of the Thames.—The first report of the commissioners appointed by Her Majesty to inquire into and consider the most effectual mode of improving the metropolis, has just been published. It it principally taken up with plans for embanking the Thames, and with the evidence, as taken, at length. Our limits do not allow us to give any of the evidence in detail; but the following is the portion of the report embodying the resolutions of the commissioners. "We have observed with great satisfaction the almost unanimous concurrence in opinion, upon all the main topics to which our inquiries were directed, among the scientific and practical gentlemen thus consulted; and it was with a corresponding confidence that we finally came to the following resolutions:—1. That it appears to the commission that the present state of the river Thames, above London Bridge, is such as to render highly expedient the adoption of some proceedings for remedying the existing defects, and for preventing the further deterioration of the navigation. 2. That for securing these important objects, an embankment of the river would be the most effective measure. 3. That though a general embankment between Vauxhall and London Bridges appears to be highly expedient, yet that it is most urgently required on that portion of the Middlesex, or left bank of the river, which lies between Westminster and Blackfriars Bridges. 4. That such an embankment might be advantageously combined with the formation of a carriage and foot line of communication between Scotland-yard and Blackfriars-bridge, whereby the great objects of public recreation and health would be promoted, and considerable relief be given to the existing insufficient thoroughfares between the eastern and western districts of the metropolis. 5. That by the adoption of the general principles of embankment presented in the plan of Mr. Page (with certain modifications which have been suggested, and others which may be suggested hereafter), there is reason to expect that the great public benefit of the improvement of the river, and the obtaining a new line of communication, may be acquired without detriment to the trade now conducted on the Middlesex shore. 6. That the commission, being disposed on these grounds to recommend the adoption of this great metropolitan improvement, will proceed forthwith to ascertain as nearly as it can be done the probable expense of carrying it into execution, and also to inquire in what manner the funds required for the purpose may best be provided, so as to press with the least possible weight and inconvenience on the inhabitants of the metropolis and its environs."

National Monument to Newton.—Mr. Steele, who has been recently so much before the public in connexion with the state trials in Ireland, has addressed a letter to Lord Lincoln reviving his long cherished project of the erection of a magnificent national monument to Sir Isaac Newton, which he originated 18 years ago, by a letter from his own college at Cambridge, and in promoting which he has had, within the last seven years, two petitions presented from him to Parliament. The first was presented by Lord Monteagle, when Chancellor of the Exchequer; the second by Mr. Hume. He has now revived the subject by a public letter to Lord Lincoln, the chairman of the committee for the improvement of the metropolis. The time for offering this suggestion is happily chosen, at a moment when the improvements in the neighbourhood of Leicester-square afford an opportunity of preserving the house and observatory of the astronomer.

South Sea Company.—The meeting of proprietors of South Sea Stock was held last week, and was more numerously attended than usual, it having been rumoured during the week that some novel and important communication was about to be made. The business was opened by Mr. Franks, the Sub-Governor, who stated that the bond debt of the company had been ascertained not to exceed 4500*l.*, an amount for which the directors were certainly liable, though they never expected to be called upon to pay it, considering the long period which had elapsed since it was customary for the company to issue such bonds. It was further stated that the guarantee fund of the company amounted to about 376,000*l.*, the sum on the last occasion having been 371,964*l.*, since which period investments had been made to the extent of nearly 4000*l.* Mr. Franks then adverted to the charge which had often been made against the directors by the proprietors, of not employing their capital to the best advantage, so as to return a more profitable dividend than that which they at present enjoyed; and explained that under the charter they were not able to improve their position, being now prohibited from acting as a trading company; but under an arrangement which would shortly be presented to the proprietors in the shape of a prospectus for their assent or otherwise, it was possible that they would be able to employ their capital in an advantageous manner. The directors having given their best attention to the plan about to be submitted to the proprietors, were of opinion that it would be found beneficial to the interests of all holders of South Sea Stock. This communication scrupulously excluding the least hint at the detail of the plan, and in general terms referring to trust property, appeared to be received with general satisfaction, and a unanimous vote of thanks was passed to the Court, it being understood that the prospectus would be forwarded to the proprietors as soon as it could be printed. The prevailing belief is that it is intended to make this company the depository of trust funds generally in cases where security must be a permanent object, and to charge a commission for the safe keeping of such funds and the transaction of business connected with them.

New Zealand Company.—On Friday the adjourned meeting of this Company was held, Joseph Soames, Esq., in the chair, supported by Lord Courteney, Lord Petre, Sir R. Howard, M.P., Mr. Mangles, M.P., Mr. Buller, M.P., Mr. J. A. Smith, M.P., Alderman Thompson, M.P., Mr. Majoribanks, M.P., and Mr. Hutt, M.P. After the confirmation of the minutes, the report was read as follows:—"It was not till yesterday that your Directors received an expression of the views of the Secretary of State for the Colonies with respect to the representations to his Lordship mentioned in their last report. They were then honoured with some unofficial communications, from which your Directors understand, in the first place, that Her Majesty's Government would be strongly disposed to entertain favourably a proposal for pecuniary assistance to be afforded by the Government on the following conditions:—1st, That such assistance shall not exceed 40,000*l.* in the whole. 2d, That it shall be applied to the payment of the bills now unpaid, which have been drawn from the colony, to provide for the employment of labourers, and to the payment of such other bills as may be drawn for the same purpose during the interval which must elapse before a report can be received from Governor Fitzroy as to the state of the Company's settlements, and the steps which he may have taken in consequence. 3d, That the whole of the property of the Company, including that part of the capital which has not been paid, and which the Company would be required to engage to raise within a limited period, shall be made liable as an available security for the repayment of such advance; and, secondly, the directors have received assurances of the desire of the Government to maintain the most cordial relations with the company in carrying on the work of colonisation; and that the instructions issued to Captain Fitzroy were intended to have, and it is believed, will have had the effect of quieting the titles of those settlers who have obtained land under the company, and of facilitating the acquisition by the company of a valid title to the remainder of their lands." The report proceeded to say, "that there were various points respecting the relations between the Government and the company, which are of more importance even than that of pecuniary assistance, and without the satisfactory settlement of which the directors think that nothing could be gained by the acceptance of that assistance." The Lord Provost of Glasgow, in moving the adoption of the report, said, that hitherto the conduct of the directors had been such as to satisfy the shareholders, and that notwithstanding the recent misfortunes, there was no doubt the shareholders would still place every confidence in them. Mr. Geo. Robins, in seconding the motion, also eulogised the conduct of the directors. The report was unanimously adopted, with the condition that the next meeting should be on April 26.

Van Diemen's Land Company.—The meeting of the Van Diemen's Land Company was held last week. The report stated that the prospects of the operations of the directors are improving as respects the increase of tenancy, though the depression prevailing throughout the Australian colonies still leaves them burdened with an immense stock, for which they are unable to find purchasers. Of

course in this state of affairs no dividend could be declared, and it was only in hopes for a change which will bring about a better condition of things that the shareholders appeared inclined to support the company any longer.

Canada Company.—The half-yearly meeting of this corporation was held last week, pursuant to the terms of the charter, the Governor, Mr. Franks, in the chair. The report stated that the sales of land in the Crown reserves during the past year had been 12,838 acres, at an average of 13*s.* 7*d.* per acre, and in the Huron tract 8705 acres at an average of 12*s.* 1*d.* per acre; making a total of 21,543 acres, producing 13,804*l.* currency, independently of the town lots purchased. There had been leased of Crown reserves during the year 68,805 acres, producing an annual rental of 2769*l.*, or equal to 10*s.* 5*d.* per acre; and in the Huron tract, 63,907½ acres. The leases were granted for twelve years, at a rental, which if regularly paid, the land would become the property of the occupier, and consequently alienated from the company. The total quantity of land leased and sold was 194,255 acres. The Governor then read a statement of the receipts and expenditure of the corporation from its commencement, which was considered satisfactory. The company had 1,378,189 acres of land paid for, but still unsold. The quantity purchased from the Government was 2,484,413 acres. Of this there had been 982,941 acres sold, and 123,313 acres had yet to be paid for, the company having the option of taking the latter. Since the commencement of the year there had been sold in the Crown reserves 1500 acres, and in the Huron tract 800 acres. There had been leased in the former 3800 acres, and in the latter 7290 acres, an increase over the operations of the same period of 1842 of 3753 acres. In the receipts there had been an increase of 2842*l.* The plan of leasing the land had been most beneficial, and the rents hitherto had been punctually paid. The colonists on the company's lands were improving, as was shown by the remittances made to their poorer relatives in the United Kingdom, which, upon an average, had in the last year been 9*l.* for each individual, who had sent home money to fathers, mothers, &c. through the company's agency, and which was afforded gratuitously. The total amount so remitted from Canada to the company last year was 2990*l.*, and by the last letters 600*l.* in addition, similarly destined, were advised. This showed that the settlers upon the company's lands were prospering, and that the position in which the colony was placed was improving.

New Royal Exchange.—With the punctuality that has attended all the proceedings connected with this edifice, the mass of Bank-buildings, which concealed the principal front, have been removed within a short month, and the portico is now open to Cheapside. This portico is the largest in London, and is only second to the portico of the Pantheon at Rome and the Madeleine at Paris. It consists of eight Corinthian columns, the extreme breadth being 90 feet, and the height to the apex of the pediment 76 feet. At the meeting of the Gresham Committee, which took place on Saturday, further decorations in sculpture were agreed to, at the expense of the committee; and it was resolved, that in addition to the sculpture on the pediment, the interior should be decorated by a statue of the Queen, and that a new statue of the founder, Sir Thomas Gresham, should be provided and placed in the niche of the tower over the great eastern entrance. Other suggestions for further decorations were referred to a sub-committee for consideration.

St. Stephen's, Walbrook.—A meeting of the parishioners was held on Wednesday, to elect overseers for the year ensuing. Alderman Gibbs and the other members of the select vestry requested the parishioners to withdraw, but they refused, and the select vestry immediately adjourned to the private residence of Alderman Gibbs. The parishioners then constituted a vestry for themselves, the Rev. Dr. Croly in the chair, and Mr. H. Rock and Mr. J. Williams were nominated overseers of the poor, and Mr. Crosby vestry clerk in the room of Mr. Pearce, who had resigned. Mr. Rock said the time had arrived when the parishioners must take a decided step to effect the election of proper officers for the present year. They had received no accounts for 20 years, nor had any notice of monetary matters been made in the usual vestry books. An account, it was true, had been printed and very generally circulated thoughout the city by Alderman Gibbs, but never presented to the parish or audited by any person regularly appointed. He was now prepared even to impugn that account. Mr. Rock read the following receipt, which was handed round for the inspection of the parishioners:—"Received, 31st May, 1839, of the churchwardens of St. Bennett Sherehog, seventy-three pounds two shillings and ninepence; the proportion of expense of that parish for the united parishes of St. Stephen's, Walbrook, and St. Bennett Sherehog, due in Easter, 1837. 73*l.* 2*s.* 9*d.* (Signed) Michael Gibbs, Churchwarden, St. Stephen's, Walbrook." The production of this document in the handwriting of the alderman caused a great sensation, as it does not appear in the accounts furnished and printed by that gentleman. Mr. Rock said it was not necessary for his present purpose to impute fraud to Alderman Gibbs. It was quite enough for him to say that 73*l.* had been received and not accounted for. If the parishioners had had yearly accounts and yearly auditors, this inaccuracy would have been detected. It was necessary to provide now for the future. He imagined the meeting agreed with him that Alderman Gibbs and his present colleagues were unfit persons for their officers for the ensuing year; and it remained for them to provide persons more worthy of their confidence. Three quarters' salary were due to the rector, the organist, the parish clerk, and others. Sums were likewise owing to the Poor-law Commissioners amounting to 400*l.*, and the dome of their beautiful church was crumbling in for want of repair, while the wind drove through the roof upon the heads of the worshippers, and the rain fell through and rotted the matting provided at the expense, and voluntarily so, of the rector.—Mr. Cunliffe, Mr. Howitt, and Mr. Flight, addressed the meeting, and said that no funds should be wanting to prosecute the suit which had for its object the obtaining justice from Alderman Gibbs.

Launch of the Boscawen.—The launch of this line-of-battle ship took place on Wednesday, in the presence of an immense concourse of spectators, who were induced by the novelty of the sight and the fineness of the day to visit Woolwich for the occasion. The river was crowded with steamers and boats of all descriptions, filled with visitors. The vessel was named by the Countess of Haddington, and she glided off the stocks in gallant style without the occurrence of a single accident. The Boscawen is 180 feet long on the gun-deck, and 2213 tons old measure, and she is pierced for 70 guns.

Sunday Trading.—The magistrates of Westminster have caused notices to be served on the churchwardens of the different parishes, calling upon them to direct shopkeepers and others to abstain from selling goods on the Sunday. Since these notices were issued, several poor people, who obtain a pittance by vending articles in the street, have had their goods seized by the police, and been brought before the magistrate to answer the charge of violating the 29th of Charles II., which declares that nothing but milk and mackarel should be retailed on the Sabbath. The magistrate said there were six days on which persons were to labour, and they could not be permitted to violate the seventh, which was the Sabbath. As this was the first time they had come before him he should discharge them, but if the offence was repeated by them, or persisted in by others, he should inflict the full penalty. In the City, the inhabitants of Dowgate, Queenhithe, and Vintry wards (particularly the butchers), have come to the determination of not opening their shops on the Sabbath.

General Tom Thumb.—On Monday evening, "General Tom Thumb," the celebrated American dwarf, had the honour of appearing for the second time before the Court at Buckingham Palace. In addition to Her Majesty, the Queen of the Belgians, the Prince of Wales, the Princesses, a distinguished party had been invited to witness the performance. His delineation of Napoleon elicited great mirth, and this was followed by a representation of the Grecian statues, after which the General danced a hornpipe and sang several of his favourite songs. Her Majesty was pleased to present the General with her own hand a *souvenir* of mother of pearl, mounted with gold and precious stones. On one are the Crown and Royal initials V. R., and on the reverse bouquets of flowers in enamel and rubies. In addition to this Her Majesty subsequently presented the General with a gold pencil-case, with the initials of Tom Thumb, and his coat of arms engraved on the emerald surmounting the case, accompanying it with the expression of Her Majesty's high gratification at his versatile talents. The dwarf had scarcely made his appearance in the afternoon at the Egyptian Hall, when the Duke of Wellington honoured the General with a visit. At the moment the Duke entered the room, the General was in the act of giving an imitation of Napoleon musing at St. Helena, and on the Duke inquiring what he was meditating on, he happily replied, "Upon the loss of the Battle of Waterloo." His Grace then took the dwarf into his arms, and asked him several questions, with the answers to which the Duke appeared much pleased, and on his departure the Duke gave the General a handsome present.

Fires.—On Thursday night, a fire broke out at the Crown and Cushion Spirit Vaults, 287, Oxford-street, at the corner of Gilbert-street. The house was four stories high, and, from the combustible nature of the stock, the entire building was soon a mass of flames. The rapidity of the fire was, unfortunately, attended with fatal consequences; and four bodies, supposed to be those of Mrs. Williams, the landlord's wife, and the servants, have been already found among the ruins. It is believed that two other persons perished in the flames.

Murder.—On Saturday evening a dreadful murder was committed by a man named William Crouch upon the person of Frances Crouch, his wife, in Little Marylebone-street. The murdered woman, was about 26 years of age, and had a child about nine months old. Since their marriage the husband has led an idle life, acting as a horse-keeper occasionally, but never being in constant employ, while his wife was a prudent and industrious woman, maintaining him for a part of the time by her labour, and the assistance she received from her mother, who is living in the situation of a lady's maid in the neighbourhood of Wilton-place. For some time his conduct towards his wife was very bad, and her mother declined any longer to assist her unless she consented to part from her husband, which step she adopted a fortnight since, when she removed to Marylebone-lane. The husband on Saturday called upon her there, and cut her throat with a razor, almost severing the head from the body. The evidence of the fact was too clear to admit of a doubt; and both at the inquest and before the magistrate the prisoner was fully committed for trial on the capital charge.

Inquest.—An adjourned inquest was held on Thursday, on the body of Charlotte Griffin, housekeeper in the family of Mr. G. Scratchley, surgeon, of 168, Fleet-street. It appeared that she had formerly lived with the brother of this gentleman, the Rev. C. J. Scratchley, curate of St. George the Martyr, Bloomsbury; but he had broken off his connexion with her when he entered the church. She had latterly fallen into bad habits, stealing her master's property, and mixing with low associates. She was always desponding when the rev. gentleman visited her master's house, and on Saturday last, while he was there, she destroyed herself by taking laudanum. The jury returned the following verdict:—"We find that the deceased, Charlotte Griffin, committed suicide while in a state of temporary insanity, induced by the cruel and heartless conduct of Mr. Charles James Scratchley, B.A., and we are compelled to express our strong disapprobation of the flippant and unfeeling manner in which that gentleman's evidence was given on the night of Monday last."

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending March 23—West Districts, 171; Northern, 197; Central, 176; Eastern, 202; Southern, 235; Total, 981. Weekly average for the last five years, 946.

Provincial News.

Agricultural Meetings.—A meeting in favour of protection was held last week at Garstang, Townley Parker, Esq., in the chair, supported by P. Dawson, Esq., of Hornby Castle; C. Bourne, Esq., of Stalmire; W. Garnett, Esq., of Quernmoor Park; James Main, Esq.; A. R. Ford, Esq., of Ellellaw,; J. Cunliffe, Esq., of Myerscough House; Rev. R. Moore; T. Y. P. Michaelson, Esq., of Barrow Isle, and a numerous body of the tenant-farmers and landowners of North Lancashire.—A meeting was held at Brecon last week, Mr. J. Stephens, of Sheephouse, a tenant-farmer, in the chair, supported by about 1000 landowners and farmers connected with the county.—On Monday, a meeting was held at Selby, John Foster, Esq., in the chair, supported by G. P. Dawson, Esq., of Osgodby Hall; Rev. R. Paver, of Brayton; W. Burton, Esq., and a large number of agriculturists.—On Friday a meeting was held at Lanark, Sir N. M. Lockhart in the chair, supported by several hundred proprietors and farmers of the county.

Brighton.—On Monday the magistrates were engaged in investigating a charge brought against a man named Eli Markwick, of committing another murderous attack on a policeman named Huggett. It appeared in evidence that on Saturday night the policeman found the prisoner making a great disturbance at the door of a public-house, and endeavoured to get him home quietly. The prisoner went away; but the landlord, knowing that his customer was likely to return, asked the policeman to remain for a short time. The policeman accordingly remained for a few minutes, when the prisoner returned, and the policeman having gone a few steps to meet him, he drew a broomstick from behind him, and beat him over the head and body in a ferocious manner, till the landlord went to his release. The prisoner was found shortly afterwards couched near the spot with the stick under his arm, and was conveyed to the Town-hall. On his way there he expressed a hope that the man would die, and said that several of the police ought to be served in the same manner as Solomon. He has been remanded by the magistrates, to see whether the constable will recover.

Bristol.—Some curious particulars have just transpired on the subject of the large steamer Great Britain, the property of the Great Western Steam-ship Company. This immense steamer has been in the dock at Bristol from the time of the launch, which took place in the presence of Prince Albert several months since. The completion of the vessel has now been effected, and the Great Britain has been actually advertised to depart on July the 13th for New York. But in attempting to bring her out of the dock it has been discovered that her breadth is too great to admit of her passing the gates, and thus is the Leviathan steamer embayed and imprisoned without a prospect of release, as the only mode of extrication appears to be to widen the gates of the dock. Application has been made for this purpose to the Bristol authorities, but the corporation refuse to alter their property as a remedy for the errors of the builders of a single ship, and the difficulty is therefore proposed to be overcome by the extraordinary expedient of bringing a Bill into Parliament to authorise the compulsory enlargement of the gates of the dock. The success of this appeal is considered doubtful, and what may eventually be the fate of the Great Britain the people of Bristol cannot very clearly foresee. Another circumstance of considerable interest has been made known with regard to the arrangements of the Great Western steam-ship. It is stated that the sale of the celebrated Great Western to the Oriental Steam Navigation Company has been concluded within the last few days. The navigation of the Atlantic by steam will accordingly now be confined to the line of Mr. Cunard, so far as the Canadas and the United States are concerned.

Cambridge.—A meeting of the resident graduates of the University was held last week in the Woodwardian Museum, to consider the propriety of inviting the British Association to hold its meeting for 1845 at Cambridge. The Dean of Ely presided. Professor Whewell opposed the invitation, on the ground that the Association ought to visit Hull, Leeds, or Norwich before it came back again to Cambridge. Professor Sedgwick considered that the inhabitants of the towns mentioned had already seen the Association at York, and strongly supported the invitation as a duty which they owed to science. It was ultimately resolved to adopt the invitation, and a deputation was appointed to communicate it to the Association.—A fatal accident happened at Cambridge on Thursday, in consequence of which Mr. Edward Jones Fox, an undergraduate of St. John's College, lost his life. Mr. Fox and three of his friends were going towards Trumpington in a phaeton and pair, when one of the reins broke, and Mr. Fox leapt out of the vehicle, sustaining in his fall injuries of which he died the same night. He was the son of Dr. Fox, of Berkeley-square, Bristol.

Cardigan.—The turnpike-gate recently put up at the upper end of this town, on the road to Aberystwith, was entirely destroyed by Rebecca and her daughters last week, although it was within 6 yards of the county gaol, 200 yards from the barracks, and the London police regularly perambulate the town night and day. The commissioners when in the town were informed that this gate was unnecessary and the cause of the grievances; notwithstanding which it was again replaced, and has again fallen.

Derby.—The colliers have at length turned out in all the collieries of this county. On Wednesday last, considerable sensation was created in Derby by the arrival of a body of colliers, numbering about 340, from Pinxton, Ripley, and other places in the mining districts. They entered the market-place, from whence they proceeded in procession, three or four abreast, through the town to the Exchange, where they held a meeting, after which a collection was made among the people assembled, and the meeting dispersed. On Monday last a meeting was held at Chesterfield, by the colliers and iron-stone getters, who in Chesterfield joined the Union. A large concourse of people assembled to hear the statements of the speakers concerning the condition of the miners. Meetings have been held at Belper, Alfreton, Ilkeston, Mansfield, and other places, and coals have risen considerably in price.—Accounts from Leicester state that the strike has extended to the Whitwick, Snibston, and other coal-pits in that county. For several weeks past the men have been working only three or four hours daily, and intend to discontinue their labour altogether, unless their terms are agreed to by the proprietors of the different collieries.

Isle of Wight.—An evening paper states that the Isle of Wight Joint-stock Bank, which was formed on that of Rice and Bashford's, of Newport (better known as Sir Richard Bassett's), has suffered severely by the conduct of their managing directors, having, in less than two years, lost the whole of their paid-up capital. The shareholders, finding themselves such considerable losers, involved in law suits and their issues contracted, have resolved on closing the concern this week, in favour of the National and Provincial Bank of England, which will open on the same premises this day. The losses in the island by the last three banking establishments, have been immense.—It is said to be in contemplation to erect a pile pier in the vicinity of Osborne-house, for the use of Her Majesty and the Royal Family, whereby they will be able to proceed by their private road to embark in the Royal yacht. Some of the members of the Board of Admiralty, accompanied by Capt. Brandreth, director of the works, have visited the neighbourhood to ascertain the proper site for such a pier.

Liverpool.—A public demonstration in this town was given on Thursday week to Mr. O'Connell, W. Rathbone, Esq., in the chair, supported by many hundred persons. The meeting took place in the Amphitheatre, which was crowded to excess. Several speeches were delivered in favour of justice to Ireland, and in condemnation of the proceedings adopted at the late trials in Ireland, as a violation of constitutional rights. Mr. O'Connell addressed the meeting at great length.

Oxford.—On Friday Elliott, the cigar merchant, who has been in custody for the last fortnight on suspicion of being concerned, with others not yet in custody, in robbing the Defiance Oxford coach of 1500 sovereigns, was for the third time brought before Drs. Harrington and Marsham, magistrates for Oxfordshire, and, after undergoing a private examination, was remanded for ten days longer. From all that can be learned about the robbery, it appears that it still remains in profound mystery. It had been stated that the other parties concerned in it were well known to the metropolitan police; but notwithstanding this and the profound secresy observed in the whole affair, it does not appear that the persons engaged in the investigation have been able to advance a single step in the matter.

Shrewsbury.—The *Shrewsbury News* states that the vast property belonging to the bankrupt estate of Messrs. Harford, Davies, and Co., consisting of the Ebbw Vale and Sirhowy Iron Works, were on Monday last purchased by certain partners in the Colebrook Dale Company, who come into possession in the week ensuing. The purchase money is 216 000*l.* Upon the property upwards of 6000 persons are located, and the total extent of land is upwards of 3500 acres. In consequence of this fortunate arrangement, the creditors of Messrs. Harford, Davies, and Co., anticipate that a dividend of 14*s.* or 15*s.* in the pound will be immediately paid them.—The Tixall estate, consisting of Tixall-hall, and the entire domain of Tixall, nearly 4000 acres of land, situated in the Garden of Staffordshire, has been purchased by Viscount Ingestrie from Sir Clifford Constable; Sir Clifford reserving to himself Haywood Abbey, the ancient seat of the Aston family.

Railways.—The following are the returns for the last week:—Birmingham and Derby, 1279*l.*; Birmingham and Gloucester, 1988*l.*; Eastern Counties, 3331*l.*; Edinburgh and Glasgow, 1982*l.*; Great Western, 12,030*l.*; Grand Junction, 6651*l.*; Glasgow, Paisley, and Ayr, 1428*l.*; Great North of England, 1253*l.*; London and Birmingham, 14,190*l.*; South-Western, 4631*l.*; Blackwall, 620*l.*; Greenwich, 678*l.*; Brighton, 2551*l.*; Croydon, 208*l.*; Manchester, Leeds, and Hull, 5383*l.*; Midland Counties, 2371*l.*; Manchester and Birmingham, 2828*l.*; North Midland, 4047*l.*; Newcastle and Carlisle, 1415*l.*; South-Eastern and Dover, 2745*l.*; Sheffield and Manchester, 469*l.*; York and North Midland, 1784*l.*—The meeting of the Dublin and Kingstown Company took place last week, when a dividend of 6*l.* per share was declared payable out of the year's working, the surplus of profits, after providing for contingencies, being 2395*l.* 19*s.* 7*d.* The gross revenue of the undertaking appears to have amounted to 23,689*l.* The Dalkey line, which is worked by the atmospheric principle, was opened to the public last week, and an experimental trip made a few days previously is spoken of by the Irish journals in the most satisfactory manner.—The dividend declared at the Newcastle and Carlisle meeting was 4 per cent. for 100*l.* share, free of income-tax. Although the receipts of the line have fallen a trifle below those of last year, the directors seem to have every confidence in the ultimate success of the undertaking, and they are using every endeavour by the reduction of interest on their bonded debt and curtailment of general expenditure to exercise a proper economy for the benefit of the shareholders. It was stated at the meeting that the line will be completed for a sum less by 120,000*l.* to 130,000*l.* than the amount allowed to be raised by the powers of the act of Parliament. The act allowed 1,250,000*l.*, and at present little more than 1,000,000*l.* had been expended, in which is included, not only the formation of the line. but also the depots, engines, carriages, and other machinery.—The committee of the House of Commons appointed to try the merits of two bills brought into Parliament by the Great Western and South Western companies, the one for constructing a branch line from the South Western line to Newbury, and the other for the construction of a branch line from the Great Western line to the same place, concluded its labours on Tuesday, after having sat nearly a fortnight. Mr. Austin, Mr. Talbot, and Mr. Gurney appeared for the Great Western Company; and Mr. Hill, Q.C., Sergeant Wrangham, and Mr. Hilliard for the South Western Company. The evidence on both sides was very voluminous, but the principal evidence was given by Mr. Brunel, the engineer for the Great Western, and by Mr. Locke, the engineer of the South Western. Mr. Pakington, the chairman of the committee, on Tuesday stated that the committee had come to the determination of granting the line from Basingstoke to Newbury, which was the one proposed by the South Western Company, and rejecting the line proposed by the Great Western Company from Reading to Newbury.—The Dover railway company have given notice of cheap excursions to Dover from the London-bridge station, on Easter Monday and Tuesday, being no less than 176 miles by railway for 6*s.* 6*d.*! The South Western Company have also announced excursions to Southampton and back for 14*s.*; and to Gosport and Portsmouth for 15*s*; while the Brighton Company offer an excursion to Brighton and back for 5*s.*, and to Tunbridge for 2*s.* 6*d.* This spirited and liberal example will no doubt be appreciated by the public. An interesting country and a healthful enjoyment of sea air is thus put within the reach of thousands, and it is said that these excursions will be extended to the Continent as the season advances.

IRELAND.

Dublin.—It having been generally known that Mr. O'Connell had arrived from England, and would attend the weekly repeal meeting on Monday, the doors of the Conciliation Hall were at an early hour besieged by applicants for admission, who were anxious to greet him on his arrival. Mr. S. O'Brien presided, and Mr. O'Connell opened the proceedings by announcing the receipt of 600*l.* from the New York Repealers. Mr. J. O'Connell said he had been honoured by Lord Ffrench with the perusal of a correspondence which passed between him and Lord Charlemont upon the subject of Repeal, and as he had been permitted by his lordship to make it public, he would read it for the meeting. He then read Lord Charlemont's letter, which proposed periodical sittings of the Imperial Parliament in Dublin, and requesting his signature to an address to the Queen for that purpose. Lord Ffrench's answer was of great length, but its substance stated that he did not approve Lord Charlemont's plan of an itinerant Parliament, and would not therefore append his signature to the address. Mr. O'Connell then addressed the meeting at great length on the reception he had met with in England, on the question of the Presbyterian Marriages, &c. He said that although he should be sent to prison the cause of Repeal would still prosper, and that if the people followed the same peaceable course in 1844 that they did in 1843 the question of Repeal would be clenched. The funds of the Repeal Association would be the pulse of the Nation which would truly tell the real condition she was in. Let the people go on subscribing their penny a month, and the year 1844 would give them more members than they had in 1843; those numbers would be counted in the amount of their funds instead of millions meeting in noon-day; and if the people persevered, as he knew they would, nothing could retard their cause. For himself he cared little what would become of him, but he felt a serene conviction on his mind that a day of peace, prosperity, and happiness was about to dawn on Ireland. He would conclude by moving three resolutions. First, that it be referred to the committee to devise the best means of rendering assistance to the Presbyterians in their present circumstances. Secondly, That an address of affection and gratitude from the Irish nation be prepared and presented to the English people. Thirdly, That an address to the Irish people be prepared, calling upon them to persevere in the same peaceable cause that had marked their progress up to the present period. These propositions were put and carried amidst loud cheers. The amount of rent for the week was about 910*l.*—The landlord and tenant commission, consisting of Sir R. Ferguson, Mr. G. Hamilton, Mr. Redington, and Mr. Wynne, were actively engaged at Belfast on Monday, Tuesday, and Wednesday last week, in making inquiry respecting the occupation of land in the counties of Down and Antrim. They examined at great length the agents of the Marquises of Hertford and Londonderry, Mr. D. Ker, and other proprietors, together with a number of occupying tenants and farmers, as well as the persons selected for examination by the several boards of guardians in the neighbourhood of Belfast. On Thursday they proceeded to inspect the improvements now in progress on Lord Dufferin's estate, near Donaghadee, and on Lord Londonderry's near Newtownards, and the draining, &c., on the property of Messrs. Andrews, at Cumber. On Friday they held their inquiry at Antrim. On Saturday they were joined by the Earl of Devon, at Banbridge, and examined a number of witnesses respecting the occupation and management of land on the large estates in that neighbourhood of the Marquess of Downshire, Lord Roden, Mr. Whyte of Loughbrickland, and others. During the present week they were to visit Larne, Colraine, and Moneymore.

SCOTLAND.

Edinburgh.—On Saturday, the 23d of March, the Senatus Academicus reduced the list of candidates for the Professorship in the Edinburgh University to three—namely, Messrs. Donaldson, Bennet, and Mainzer, and agreed to meet on that day week for electing a Professor. In the interval, however, another candidate sent in his claims—a gentleman, it is said, possessing high qualifications for the chair, namely, Henry H. Pearson, Esq., at present residing at Dresden, and son of the Dean of Salisbury. In consequence of this application, the Senatus, on a motion made to that effect, and by a majority of one, agreed to postpone the election till the 1st of June next, in order to give time for the electors to investigate the claims of the new candidate.—The Lords of the Treasury have authorised the erection of four new and greatly-enlarged Lords Ordinaries' court-rooms, to replace the present small and inconvenient courts of law in this city.—The directors of the public baths recently established in Edinburgh, have received, by letter, a donation of 100*l.* from Prince Albert, who has been also graciously pleased to intimate that he feels "most happy to contribute that sum to the effecting of so very praiseworthy an object."

Law.

HOUSE OF LORDS.—*The Queen* v. *Millis.*—*Appeal.*—We noticed briefly in our Parliamentary Report last week, that this case had been decided on Friday. The following is a summary of the proceedings:—After a long conversation between the Lord Chancellor and Lords Brougham, Cottenham, and Campbell, the above case was called on. Lord Brougham thereupon moved that judgment be entered for the plaintiff in error. (Had this proposition been adopted, the first marriage—namely, that which had been performed according to the Presbyterian form *per verba de præsenti*, would have been held to have been a valid marriage. The Lord Chancellor having put the question, declared the division to have been in favour of the "Contents." Lord Cottenham then moved that the House do divide. Strangers were ordered to withdraw, and the House divided, when there appeared—Contents, 2; Non-contents, 2. The result of this division therefore will be, that the judgment of the Court below, declaring the first marriage to be invalid, will stand undisturbed, each party of the law Lords present being equal in number.

NORFOLK CIRCUIT, NORWICH.—*John Knowles, sen.*, and *John Knowles, jun.*, were indicted, the latter for feloniously setting fire to a dwelling-house and some corn-stacks, &c., with intent to defraud the Norwich Union Insurance Company, and the former for procuring him to commit that felony. The prisoners are father and son, and the former before and at the time of the commission of the felony in question was by trade a cooper, and also head keeper of the Happisburgh lighthouse on the Norfolk coast, and the tenant of a small farm at East Ruston; his son resided with him at the lighthouse. The elder prisoner was about to quit his farm at Michaelmas, and in the course of last summer he insured his stock in trade, his furniture, and farming produce, in the office of the prosecutors, in a sum which appeared by the evidence to be beyond the value of the property insured. On the 10th Oct. the farm was fired, and the younger prisoner was seen on the premises shortly before the flames burst forth. The elder prisoner was also absent from his lantern that night. The Jury found both prisoners *Guilty*, and they were sentenced to transportation for 15 years.

POLICE, MANSION HOUSE.—On Saturday *Mrs. Dorey*, *Mrs. Saunders*, alias *Emma Slack*, and the other persons charged with being concerned in the Wills Forgeries, were brought up for final examination. The evidence adduced was for the purpose of connecting Mrs. Saunders with the other prisoners. After a long examination the Lord Mayor committed all of them to Newgate to take their trial at the ensuing sessions.

BIRTHS.—On the 26th ult., at Bordeaux, the wife of N. JOHNSTON, Esq., of a daughter—25th ult., at Lynn Regis, Dorset, the wife of Major MASTER, 4th Light Dragoons, of a son—Lately, at Stretton-hall, Staffordshire, the lady of Lieutenant-General MONCKTON, of a son—26th ult., at the house of her father, West Exe Lodge, Tiverton, the lady of the Rev. E. POLE, of a son—27th ult., at Edinburgh, the lady of Sir D. DUNDAS, of Beechwood, Bart., of a son and heir—29th ult., at the Vicarage, Warkworth, the lady of the Rev. H. PERCY, of a son.

MARRIED.—On the 24th Feb. last, at St. Mary's, Islington, W. H. F. PLATE, LL.D., third son of H. Plate, Esq., Governor of Delmenhorst, Germany, to EMILY BARNARD, widow of the late James Barnard, Esq., of Park-street, Islington, and daughter of the late J. Daniel, Esq., of Newgate-street and Camberwell—21st ult., at Kenton Church, W. E. S. CLARK, of Buckland Tout Saints, Devon, Esq., to MARIANNE NEWMAN, eldest daughter of Sir R. W. Newman, Bart., of Mamhead.

DIED.—19th ult., at Dover, ROBT. WRIGHT, formerly of London, merchant, aged 72—25th inst., at her residence, No. 112, Camden-road Villa, Mrs. H. SMITH, late of the Island of Nevis, aged 69—26th inst., at his residence in the Close, Norwich, the Rev. F. HOWES, minor canon of Norwich Cathedral, and rector of Warningham Pigott, Norwich, aged 68—28th inst., at Bath, F. W. FANE, Esq., Rear-Admiral of the White—29th inst., ELIZ. VIGERS, relict of the late Edward Vigers, of Kennington, Surrey, aged 79—29th ult., at her residence, 36, Fitzroy-square, London, Mrs. K. BROWN, aged 83—30th ult., after a few days' illness, CATHERINE LEGH, wife of E. Legh, Esq., of the Limes, Lewisham, Kent—30th ult., at Portland-square, Bristol, MARY WYNDOWE, relict of the late S. Wyndowe, Esq., of Kingsdown, in the county of Gloucester, aged 85—30th ult., at the residence of his son, Farnham, Surrey, S. CLARKE, Esq., late of Poole, Dorsetshire, aged 72—30th ult., at Sheffield, T. D. PHILIPPS, Esq., surgeon, youngest son of the late Rev. N. Philipps, D.D., of Moor-lodge, near that place—30th ult., at Lambeth, FRANCES GOULDHAWKE, widow of the late Capt. James Gouldhawke, of the Hon. East India Company's Service, aged 44—31st ult., at his residence in Kennington-lane, sincerely beloved and regretted, J. D. NIXON, Esq., only son of the late J. Nixon, Esq., of Knockholt, Kent, aged 47—31st ult., of apoplexy, J. H. MITCHELL, Esq., eldest son of J. T. Mitchell, Esq., of Kennington, surgeon, aged 18—2d inst., at his residence, Queen's-road, Bayswater, Mr. G. B. THOMPSON, of 390, Oxford-street, aged 63.

NEW GARDEN AND AGRICULTURAL SEEDS.

SCOTT, BROTHERS, in announcing to their friends and the public the arrival of their Stock of AGRICULTURAL, GARDEN and FLOWER-SEEDS, for the present season, beg to observe that the entire have been selected, under their own immediate inspection, from the best growers, so that there cannot be a doubt as to the genuineness and superior quality of the Seeds; and, as they have been purchased on the most advantageous terms, they are enabled to offer them at very low prices. Their assortment of

GARDEN AND FLOWER-SEEDS

Comprise many New and Approved Varieties; and, in

FARM SEEDS,

They would particularly call the attention of Agriculturists to the collection of TURNIPS, and especially to the "Dunmurry Nonpareil" Green-top Swedish, which has fully sustained the high character with which they last year introduced it, for the first time. It has given the highest satisfaction to all who have grown it, and is decidedly the best variety of Swedish Turnip known.

IN NATURAL GRASSES, FOR PERMANENT PASTURE, LAWNS, &c.,

Their collection will be found equal to that of any house in the three kingdoms; and the circumstance of their having gained the first prize at the Royal Agricultural Improvement Society's Show last year, for the best and most extensive collection of specimens, grown by themselves, attests the care and attention they pay to this highly important branch of their business.

THEIR NURSERIES

Have been very greatly enlarged, and extensive ranges of glass erected, by which they can at all times supply the most extensive orders, either for the Plantation, the Farm, the Pleasure-ground, the Garden, or the Conservatory.

By unremitting exertions and attention, by every endeavour to extend their business, and by moderate prices, they hope to merit a continuance of that very liberal support with which they have hitherto been honoured, and for which they now respectfully return their best thanks.

Exchange-buildings, Belfast, March.

S., B. are Agents for several of the most eminent Agricultural Implement Makers in England and Scotland; for the sale of Mr. J. D. Young's (of Perth) celebrated Wire-fencing, Iron Gates and Hurdles; Gilchrist's Improved Sheep-Netting, &c.; Specimens of all of which they have constantly on hand.

*** *Goods delivered FREE at Dublin, Drogheda, Newry, Liverpool or Glasgow.*

YORKSHIRE LAND-DRAINING ASSOCIATION.

Capital, 500,000*l.*, in stock of 25*l.*—Deposit, 5 per cent.

PATRONS.—The Right Hon. Lord Beaumont.
The Right Hon. Lord Viscount Morpeth.
Sir William M. Milner, Bart.
Edward Stillingfleet Cayley, Esq., M.P.

PROVISIONAL COMMITTEE.

Mr. James Andrew, Kirkham Cottage, Wakefield.
Mr. Caleb Angus, Neswick, Driffield.
J. Barkerridge, Esq., Bretton, Wakefield.
Thomas Bradley, Esq., Richmond.
Christopher Bradley, Esq., Richmond.
Henry Briggs, Esq., Overton, Wakefield.

Joseph Dent, Esq., Ribstone-park, Wetherby.
J. Bailey Denton, Esq., 9, Gray's-inn-square, London.
John Grey, Esq., Dilston.
Mr. Edwin Green, Havercroft, Barnsley.
James Hall, Esq., Scorborough, Beverley.
James Hammerton, Esq., Hellifield Peel, Skipton.
J. Mildred Hustler, Esq., Bradford.
R. M. Jaques, Esq., Easby Abbey, Richmond.
James Smith, Esq. (Deanston), 13, Queen-sq., Westminster.
Mr. William Tuke, Bradford.

With power to add to their number.

BANKERS.—The York City and County Banking Company.
STANDING COUNSEL.—H. Bellenden Ker, Esq., Lincoln's-inn.
DRAINING ENGINEER.—James Smith, Esq. (Deanston.)
SOLICITORS.—Messrs. Blanchard, Richardson, and Gutch, York.
SECRETARY.—John H. Charnock, Esq., Wakefield.

This Association is formed for the purpose of affording to the Agricultural Interest, by means of its collective capital, the funds necessary for the THOROUGH DRAINING OF LAND; and of executing and superintending the execution of the works required for this purpose on the most economical and effective principles—repayment of the money advanced to be made, with interest, by such equitable half-yearly instalments as in the several cases may be determined.

Among the various objects to which of late years collective capital has been more or less successfully applied, it is not a little surprising that the one which, of all others, offers the most certain and profitable return, with the soundest security, should have hitherto been almost disregarded. The time, however, has arrived, when an urgent desire for Agricultural improvement on the one hand, and a dearth of safe and profitable investment for superabundant capital on the other, renders such an Association highly desirable to both the landed and monied interest, whilst to the community generally an almost incalculable advantage will be secured by a proportionate increase of labour and food.

At a meeting of the council of the Yorkshire Agricultural Society, held in York, on the 20th of December, 1843, a resolution was passed, approving generally of the objects of this Association, and at the monthly meeting of the Wakefield Farmers' Club held on the 5th January, 1844, a resolution approving of the principle and objects of the Association, was unanimously adopted.

At the meeting of the Royal Agricultural Society of England, at Liverpool, in July, 1841, Lord Stanley remarked—that "there was no bank in the whole country—no commercial speculation—no investment so safe, so sure and profitable, as that in which even borowed capital may be engaged, by investing it under the ground of your own soil." And in reference to this Association, his Lordship, in a letter to the Committee says:—"I am fully satisfied of the benefits which such an Association is capable of conferring on the country, if confined to its legitimate object—the lending of capital on the security of an investment in draining; and I think it very probable that many landed proprietors would avail themselves of the facilities afforded by an institution lending money on land, repayable by instalments—a condition on which few private parties are willing to lend.

Bearing in mind the important objects of the Association, and the perfect security with which its operations can be conducted, at a comparatively trifling expense (no large expenditure for previous outfit being required), it may be reasonably expected that the return for the capital embarked will be such as to insure the support of prudent and permanent investors, thereby divesting it of that speculative character which has stigmatised so many modern projects, and which it is the especial desire of the Committee to avoid.

Application for prospectuses, and further particulars to be addressed to the Solicitors, Messrs. BLANCHARD, RICHARDSON, and GUTCH, York; or to J. H. CHARNOCK, Esq., the Secretary, Wakefield.

BERDOE'S SUPERIOR LIGHT WATERPROOF

FROCKS for the spring and summer.—An extensive variety of the above, in New and greatly improved materials (in lieu of the unsightly rubbish made by Slopsellers). Now ready, guaranteed to exclude any rain whatever, and confidently recommended to those who regard a respectable appearance, or wish to avoid disappointment and vexation, made in the best manner, price 45*s.* The only measure required are—height, and size round breast and waist, under the coat. First-rate Clothing of every description upon the lowest terms possible, consistent with true economy and ultimate satisfaction.—W. BERDOE, TAILOR, WATERPROOFER, &c., 69, Cornhill (north side).

A SINGLE BOTTLE OF BETTS'S PATENT

BRANDY may now be obtained in a perfectly genuine state. This convenient arrangement for both vendor and purchaser, and their mutual security against deception, is effected by the use of BETTS'S PATENT METALLIC CAPSULE, made of pure and SOLID METAL, (not Tin Foil) which completely encloses the cork and mouth of the bottle, and is embossed with the words "BETTS'S PATENT BRANDY, 7, SMITHFIELD BARS," the *fac-simile* of which is engraved on a label affixed to each bottle.

In the present day it is impossible to produce anything new and useful without exciting the cupidity of imitators. Already attempts are made to mystify the identity of the original and genuine article, by foisting upon the public the contents of bottles having a Tin Foil covering, falsely denominated "a neat metallic capsule." J. T. BETTS & Co. therefore deem it essential to impress upon purchasers the absolute necessity of comparing the embossed Capsules with the Labels, as an infallible mode of detecting fraudulent substitutions.

BETTS'S PATENT BRANDY, thus protected, may be obtained of the undermentioned Wine and Spirit Merchants, at 3*s.* 6*d.* per Bottle, Bottles included; or at 18*s.* per Gallon, as heretofore, at

Bishopsgate Street	W. Stevens, Nos. 78 and 80.
Bayswater	Charles Simpson, 22, Bayswater Terrace.
Blackfriars Road	S. Silcock, No. 1.

METCALFE'S NEW PATTERN TOOTH-BRUSH

and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

DRAWING ROOM CLOCKS.—A. B. SAVORY

and SONS, No. 9, Cornhill, London, opposite the Bank of England, invite attention to a splendid variety of Rosewood, China, Bronze, and Ormolu CLOCKS; they go for eight days, and strike the hours and half-hours. Price 4 guineas, 7 guineas, and 10 guineas each, and upwards. The performance is warranted.

A pamphlet, with detailed lists of prices, and illustrated with sketches, may be had on application, gratis, or sent to all parts of Great Britain and Ireland, postage free, in answer to a post letter.

TO LADIES.

ROWLAND'S KALYDOR.—This Royally Patronised

and universally adopted Specific is a balmy, odoriferous creamy Liquid, composed chiefly of extracts from the most rare Flowers and Herbs of an Eastern Clime. Its discovery was no less singular (by a Lady of rank,) than its effects have been felicitous, during the last thirty years. It is the mildest and most efficacious preparation ever known for dissipating Tan, Pimples, Freckles, Discolorations, and other Disfigurements of the Skin. The radiant bloom it imparts to the Cheek, and the softness and delicacy it induces on the Hands, Arms, and Neck, render it indispensable to every Toilet.

Gentlemen will find it peculiarly grateful after shaving, in allaying irritation of the skin, and in rendering it soft and smooth.

Price 4*s.* 6*d.* and 8*s.* 6*d.* per Bottle, duty included.

CAUTION.—The great demand for this article excites the cupidity of *unprincipled Shopkeepers*, who vend the most *spurious trash* as the "GENUINE KALYDOR:"—whereas the genuine article is prepared solely by A. ROWLAND and SON, and the amalgamation of its *costly exotic* materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "KALYDOR." The genuine article has the words "ROWLAND'S KALYDOR" on the Wrapper.

*** All others are FRAUDULENT COUNTERFEITS!!!

MINIATURE GREENHOUSE, or PORTABLE

CONSERVATORY, for the Drawing-room.—H. HEWETSON has manufactured a good assortment of the WARD CASE, now so much and deservedly admired; and he begs particularly to call the attention of amateurs to one he has recently made, with 12 sides, and which has been so highly spoken of in the *Gardeners' Chronicle* of the 9th March (No. 10).

At HEWETSON'S Zinc Manufactory, 57, Cannon-street, near London Bridge. Horticultural articles of every description made on the premises to the taste of parties ordering them.

WANTED, a FOREMAN in a Provincial Nursery.—

A sober, industrious Man, that well understands the Propagation of Plants, Budding, Grafting, and Layering, and all out of door Nursery work in general, and can write a good hand. Apply, with terms and reference as to capability, to C. W. SHARPE, Seedsman, Wisbeach, Cambridgeshire.

WANTED, immediately, a middle-aged Man, as

FOREMAN and PROPAGATOR in a small Establishment in the neighbourhood of London, where nothing but Pot Plants are grown. He must thoroughly understand his business in all its branches.—Apply by letter, post-paid, to A. Z., 37, Duke-street, Grosvenor-square.

WANTED, a single, active Man, of sober, industrious

habits, from 25 to 30 years of age, who understands the Nursery business, &c. Wages, 11*s.* a week, and his board found him when out of town, which is sometimes twice a week. Unexceptionable references as to ability and integrity will be required.—Direct to J. FRAZER, Nurseryman, Aylesbury.

WANTED, a FOREMAN.—Messrs. VEITCH & SON

are in immediate want of a respectable person to act as FOREMAN in the PLANT DEPARTMENT of their Nursery. It is not requisite he should understand Propagation, as a Propagator is kept in the same department.—Exeter, April 4, 1844.

WANT PLACES.—All Letters to be post-paid.

AS HEAD-GARDENER.—A respectable middle-aged Man, who can give satisfactory reasons for leaving his situation, and whose present employer, as well as numerous gentlemen to whom he is well known as a very successful grower of Pines, Grapes, Orchidaceæ, &c., would be ready to give him testimonials of first-rate abilities as a general Horticulturist and Gardener.—Direct to R. P., at WHITE and Co.'s Nursery, Poole.

AS HEAD-GARDENER, a married Man, 32 years of age, who perfectly understands the cultivation of Hot and Greenhouse Plants, Forcing, and the management of Vines. He can be well recommended by the son of the late J. B. Nevill, Esq., with whom he lived eight years.—Direct to J. WARE, Colonnade House, Holloway, near London.

AS HEAD GARDENER.—A middle-aged married Man, without family, who has a good knowledge of Pines and Vines, also of Hothouse, Greenhouse, and has had great experience in the Pruning and Training of Wall-trees, and is a good Flower and Kitchen-Gardener. Can have an unexceptionable character from the situation he lately left.—Direct to A. B., No. 9, Brewer's-buildings, Wandsworth-road, Surrey.

AS GARDENER.—A young Man, aged 28, who has a thorough practical knowledge of his business in all its branches, and whose character will bear the strictest scrutiny.—Direct to WILLIAM THOMSON, Gardener to George Byng, Esq., M.P., Wrotham Park, Barnet, whom the advertiser has served as Foreman for six years.

AS GARDENER.—JAMES ROBERTS (Author of a "Comprehensive View of the Culture of the Vine under Glass"), Gardener to Matthew Wilson, Esq., Eshton-hall, Skipton, Yorkshire, is desirous of changing his situation, having been engaged by his venerable and esteemed employer (with whom he has been ten years), in designing and completing extensive new Kitchen and Forcing departments, Pleasure Grounds, Flower Gardens, &c. &c., which are in the highest state of cultivation. As such he begs to refer to the reports of the London Horticultural Society—to their awards of Medals. Would be glad to engage with any Nobleman or Gentleman contemplating extensive improvements, or requiring a Gardener in the highest departments of his profession, more especially in the culture of Exotic Fruits. He will be at liberty on the 16th of May next; can produce the highest testimonials; is married, and aged 40.—Letters addressed as above shall have his best attention.

AS GARDENER.—A married Man, aged 36, who perfectly understands his profession; has been accustomed to the management of Land, and will be highly recommended by the gentleman he has just left, with whom he lived above eight years.—Direct, W. Z., Montpelier Nursery, Cheltenham.

AS GARDENER.—A married Man, aged 36, without incumbrance, who perfectly understands his business in all its branches—with Land and Stock, if required. Can have eight years' character from the lady he is about to leave early in May next.—Direct to J. B., care of Mr. Fuller, Nurseryman, Chertsey, Surrey.

AS GARDENER.—A single Man, who thoroughly understands his business in all its various departments. His character, and testimonials from the gentleman he has just left, will bear the strictest investigation. No objection to reside in or out of the establishment.—Direct to A. B., Mr. BAKER'S, 3, Cottage-place, Kentish-town.

AS GARDENER.—A respectable married Man, 40 years of age, who is perfectly acquainted with the most approved systems of Horticulture and Floriculture, from long practice. References as to ability, &c., will be given to a family of the highest respectability. No single-handed place will be accepted.—Direct to A. B., Post-office, Croydon, Surrey.

AS GARDENER.—A married Man, aged 33, who thoroughly understands his business, with the management of Woods and Meadow-land. Can have upwards of four years' character from his late employer, and be highly recommended by several eminent Horticulturists.—Direct to A. B., Post-office, Hammersmith.

AS GARDENER.—A Married Man without encumbrance, age 28, who understands Greenhouse, Vinery, Kitchen Gardening, and Pleasure Grounds, with three years' good character from the place he is about to leave. Direct to E. W., 6, Hot Bath-street, Bath.

FIVE POUNDS will be Given to any good Practical Gardener, by a young Man, aged 21, for Two or Three Years' Instruction in Forcing and Plants. He has a good knowledge of Kitchen-Gardening; can have a good character from his present employer, whom he is about to leave. All Letters must be post-paid.—Direct to A. R., at Mr. CRASTIN'S, Seven Sisters' Nursery, Seven Sisters' Road, Upper Holloway.

AS GARDENER.—A Married Man, who thoroughly undertands his business. His Wife as Plain Cook; can also take charge of a small Dairy. They would make themselves generally useful. They can have an excellent character from their last place. Direct to R. POVEY, Parson-street, Hendon.

AS GARDENER.—A respectable Single Man, who has served a regular apprenticeship to his profession. The Advertiser has a thorough knowledge of the Stove, Greenhouse, Conservatory, Early Forcing, Cultivation of Plants, the Fruit, Flower, and Culinary Gardens, and can be highly recommended by his late employer. Direct A. B. C., Messrs. HENDERSON'S, Pine-apple Place, Edgware-road, London.

THE FRIENDS of a healthy, well-grown YOUTH who has just entered his 16th year and who for the last two years has been constantly employed in a Gentleman's Garden, are desirous of placing him for three or four years as indoor apprentice with a Gardener possessing the ability and opportunity to instruct him in the various departments of Horticulture. In addition to board and lodging, he must be found in washing. A moderate Premium will be given. Respectable references required. Letters, post-paid, stating full particulars, may be addressed to J. FLUDDER, Wallington, near Carshalton, Surrey.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN.—Notice is hereby given that Tuesday next, the 16th inst., is the last day for issuing tickets at the privileged price of 3*s*. 6*d*. each.

ROYAL BOTANIC SOCIETY, Regent's Park.—The Days for the Exhibition of Plants, Flowers, and Fruits, in the Gardens of this Society, are—

Tuesday, April 30,
Tuesday, June 4,
Tuesday, July 2, 1844,

when Prizes exceeding in value 90*l*. will be distributed. Fellows, Members, and bearers of Ivory Tickets will be admitted on producing their names at the gate. Other persons may obtain Tickets for admission at 5*s*. each, except on the days of exhibition, when they will be 7*s*. 6*d*., by orders from Fellows or Members.

Tickets and further particulars to be had at the Gardens, Regent's Park.

*** Promenades on May 21, June 18, and July 16.

UNDER THE PATRONAGE OF HER MAJESTY.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—The First Flower-show of the Season will be held at the Horns Tavern, Kennington, on Tuesday, April 23d. Open from One till Half-past Six. Admittance, 1*s*.

R. H. Cuming, Hon. Sec.

FLOWER-SHOW.—The Annual Flower-Show, under the Superintendence of Mr. J. T. Neville, of Ebenezer-Place, Lambeth, will be held in the Grounds of the Almshouses belonging to the Gardeners' Charitable Institution at Walham Green, Fulham, at the latter end of June or beginning of July, of which further notice will be given.

James Ness, Secretary.

NURSERIES, SAWBRIDGEWORTH, HERTS, EQUIDISTANT FROM THE HARLOW AND SAWBRIDGEWORTH STATIONS, ON THE NORTHERN AND EASTERN RAILWAY.

NEW ROSES.

T. RIVERS, Jun., has now to offer healthy Plants, which will bloom this season, of the new hybrid perpetual Rose, Madame Laffay. These are grafted in pits on stocks of the Rosa Manetti, and may be planted out with safety towards the end of April. This large and splendid Rose has bloomed with great success at Sawbridgeworth, and is undoubtedly one of the finest hybrid perpetuals known, colour brilliant Rose, very slightly tinged with lilac, in size it is larger than William Jesse, very double, and perfectly cupped, highly fragrant, and opens freely. Price 3*s*. 6*d*. each package included. Also a few plants of the old Hybrid Rose, Queen, or Beauty of the Prairies, a variety raised in this country from North America, perfectly hardy. This variety bears as large flowers as those of the Crimson Boursault, very double; and is a most charming Rose, it has thick enduring petals. Price 2*s*. 6*d*. each. *Carriage paid to London.*

The above Roses will be ready for delivery early in May. In consequence of the frequent complaints made of Roses in pots being broken when packed in baskets, by heavy weights being placed on them in the railway trucks, they will in future be sent from the Sawbridgeworth Nursery, packed in wooden cases.—April 9, 1844.

SPLENDID NEW VERBENAS.—BLUE QUEEN AND ZEUXIS.

W. MILLER, Ramsgate, will send out from his Nursery the above elegant Plants on the 22d inst.

Blue Queen.—The best Blue Verbena yet out (see Dr. Lindley in *Gardeners' Chronicle*, July 15, 1843, page 721). "M. Miller's new sweet-scented Seedling, No. 105, is the best we have seen of this colour—bright blue lilac; the flower is large, fine shape, and perfectly free from crumples." Price per plant 2*s*. 6*d*., post free.

Zeuxis.—Beautiful, novel, rosy vermilion, with large light eye. See Lindley's opinion in *Gardeners' Chronicle*, Sept. 30, 1843, page 643, "J. Miller, your Seedling, named Zeuxis, is large and fine." Price per plant 3*s*. 6*d*., post free.

W. M. has a liberal allowance to the trade when three or more are taken at once.

W. M. has plants of rich coloured scarlet Geranium, "Firebrand," now ready at 5*s*. each, post free. The Verbenas are described in the "Florists' Journal" for March, 1844.

CHOICE PANSIES.

J. HENCHMAN begs to inform cultivators of the PANSY that he is now sending out healthy plants of six good seedling varieties, for 21*s*. the set. Also a few choice kinds at 18*s*. and 10*s*. per dozen.—Edmonton, April 1844.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

YOUELL AND CO.,

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN; HIS MAJESTY THE KING OF THE BELGIANS; NURSERYMEN AND FLORISTS BY SPECIAL APPOINTMENT TO HER MAJESTY THE QUEEN DOWAGER.

NOW READY FOR SENDING OUT.

THE NEWEST AND VERY BEST FUCHSIAS, VERBENAS, PETUNIAS, ANAGALLIS, &c.,

FOR 1844.

YOUELL AND Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Catalogue of the above, which appeared in this Paper of last week, and will be found to contain such varieties only as are worthy of cultivation.

Youell & Co. being the parties who first sent out per post, with safety, these tribes of plants, are desirous of calling attention to their advantageous method of executing orders, namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, upon the following terms:—

12 Extra Fine varieties,		12*s*., the Selection left to Youell & Co.
12	ditto ditto	21*s*., the Selection left to the Purchaser.
50 Fine varieties		40*s*., the Selection left to Youell & Co.
50 Extra Fine ditto		60*s*., the Selection left to the Purchaser.

VERBENAS.

12 Extra fine Varieties, 6*s*., the selection left to Youell & Co.
12 Ditto ,, 10*s*., the selection left to the purchaser.

PANSIES. [Sent postage free.]

12 Fine Show Varieties, by name . . 10*s*. per dozen
12 Extra Fine ditto, do. . . 18*s*. ,,

FLOWER-SEEDS.—30 Packets of the choicest and newest kinds sent per post free for 6*s*.

TWO NEW SEEDLING PICOTEES.—"Lady Alice Peel," 10*s*. 6*d*., and "Mrs. Benyon," 10*s*. 6*d*. per pair.—These two splendid Picotees were raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, and kindly presented by that gentleman to Messrs. Youell & Co., for particulars of which see their Advertisement in this Paper of last week.

FINEST CARNATIONS AND PICOTEES.

YOUELL AND Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly esteemed Flowers, which appeared on the Advertising pages, 706 and 707, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

Prices as follows:	£.	s.	d.
12 pair of good Show Sorts	1	4	0
12 ditto fine ditto	1	10	0
25 ditto ditto	3	0	0
12 ditto extra fine and very superior ditto	2	10	0
25 ditto ditto ditto	5	0	0

The selection being left to Youell & Co.

FASTOLFF RASPBERRY.

For Particulars of this highly-valuable and much-esteemed Raspberry, Patronised by her Most Gracious Majesty the Queen, and most of the Nobility, see their Adv. of last week.

Fine Canes are ready for delivery, and can be sent with safety to any part of the United Kingdom (on the receipt of a Post-office order), upon the following terms:—

Packages containing 100 Canes	.	£2	5*s* 0*d*
Do. do. 50 do.	.	1	8 0
Do. do. 25 do	.	0	14 0

Package included.

☞ CAUTION.—Youell and Co. deem it requisite to inform their Friends and the Public in general of the fact, that other varieties of Raspberries are being offered for sale under the title of "Fastolff," and such having no pretensions whatever to the genuine variety, they beg to state they cannot be held responsible unless it has been supplied from their Nursery; neither have they appointed any Agents for the sale of it.

ARAUCARIA IMBRICATA IN POTS.

Recently planted most extensively at Her Majesty's Gardens at Windsor, and also at the Royal Gardens, Claremont, furnished by Youell and Co.

YOUELL AND Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 10 inches high, 10*l*. per 100, or 30*s*. per dozen.

Fine Plants of CEDRUS DEODARA, 2ft. to 2ft. 6 ins., 10*s*. 6*d*. each.

Great Yarmouth Nursery, April 11, 1844.

N.B. All Orders above £2 will be delivered carriage free either to London or Hull, or goods added to compensate for the same.

W. IVERY, Florist, Peckham, near London, begs most respectfully to offer after the 23d inst. the following beautiful Seedling PETUNIAS, FUCHSIA, and VERBENA.

PETUNIAS.

Favourite.—Large, light, with a fine blue pencilled eye, 3*s*. 6*d*.
Magna Charta.—Large, light, shaded with rose, and a very fine pencilled eye, 5*s*.
Ovid.—Very large, purple, and good shape, 3*s*. 6*d*.
Prince Albert.—A very distinct, bright rose, 3*s*. 6*d*.
Reliance.—Large, light, with a beautiful pencilled eye, and good shape, 5*s*.
The Pet.—Small, light, with a beautiful rose edge, and striped eye, 5*s*.

FUCHSIA.

Pride of Peckham.—Tube flesh-coloured, sepals tipped with green, corolla scarlet, very distinct, and fine habit, 7*s*. 6*d*.

VERBENA.

Purple Queen.—Extra fine in colour and shape, 5*s*.

N.B.—A select Catalogue of Geraniums, Fuchsias, Verbenas, Cinerarias, Petunias, Phloxes, &c., may be had on application.

NEW AND CHOICE FUCHSIAS, VERBENAS, PETUNIAS, Sold by WARNER & WARNER, Seedsmen, 28, Cornhill, London.

WARNER & WARNER beg to inform their Friends they can supply all the varieties of Fuchsia, Petunia, and Verbena now out, either in single plants or collections. They have also all the new Cinerarias, Calceolarias, Geraniums, Dahlias, &c., now in cultivation.

Catalogues of the above may be had. Plants of the new black Nemophila, 9*d*. each.—Agents for the late Mr. Loudon's works.

MESSRS. MARNOCK and MANLEY beg to inform their Friends and the Public, that their DESCRIPTIVE CATALOGUE OF FUCHSIAS, VERBENAS, CINERARIAS, DAHLIAS, &c., with a Treatise on the best and most successful Modes of Cultivation, is now ready, and may be had on application.

N.B.—Their beautiful Fuchsia, Marnock's Princess Sophia, is now ready to be sent out; the stock is not large, therefore early orders will prevent disappointment.

Messrs. Hurst and M'Mullen are Agents for their Fuchsias and Cinerarias. Nursery, Hackney, April 12, 1844.

NEW HARDY ANNUAL.

VISCARIA OCULATA—DARK EYED VISCARIA.

T. AND J. BACKHOUSE, Nursery and Seedsmen, York, have the pleasure of offering to the Public the above new and beautiful Annual, which is figured at page 53, (No. 10), of the "Botanical Register" for 1843. The blossoms are of a bright rose-colour, with a deep crimson eye, and changing to a pale purple. It flowers very abundantly through the greater part of the summer and autumn. It is a native of Algiers, and may be sown either in the open ground in spring, or raised in pots and planted out.

Packets, 2*s*. 6*d*. each, will be sent, on the receipt of a Post-office order, postage free, to any part of the Kingdom.

SEEDLING FUCHSIA, CACTUS, and PANSY, HOLLYHOCK SEED, &c.—LYNCOMBE VALE NURSERY, BATH.

J. KITLEY begs to inform the Nobility, Gentry, and the Public that he has purchased of Mr. Pond his unequalled SEEDLING FUCHSIA (PONDII), allowed by all who have seen it to be one of the largest and handsomest Fuchsias of the day; tube and sepals bright crimson, with darker corolla, and extremely free bloomer; fine compact habit; cannot fail to give satisfaction. 5*s*. per plant.

J. K. has a few more plants of fine SEEDLING CACTUS (SPECIOSA SUPERBA), 10*s*. 6*d*. per plant. Also, good healthy plants of his SEEDLING PANSY (LYNCOMBE VALE RIVAL). This Flower, both for shape and decision of colour, is decidedly the best light PANSY out. 3*s*. 6*d*. per plant.

J. K. can recommend his HOLLYHOCK SEED with the greatest confidence, having taken great care to select from his best full and very double Flowers of 1843 20 distinct varieties, named to colour, which he will forward to any purchaser post-free, on the receipt of a Post-office order for 5*s*. The whole of the above are now ready to send out.—Bath, April 12, 1844.

MAY'S "QUEEN OF MAY" CINERARIA.—The above new and beautiful Cineraria is now ready to be sent out by post, or otherwise, at 5*s*. 6*d*. each, including case, prepaid. It is confidently recommended as being one of the most splendid novelties that has been offered in Cinerarias; the colour being a beautiful light sky-blue; the flowers large and of good form; the plants compact, shrubby, and dwarf in growth.

W. M. begs to state that his descriptive List of new, superb Calceolarias may be had on application to William May, Hope Nursery, Bedale, Yorkshire.

W. M. also begs to intimate that he cannot supply any more Eucharidium grandiflorum.

PELARGONIUMS, AURICULAS, CARNATIONS, AND LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by Appointment Florist to Her Majesty, begs to inform the Nobility, Gentry, and Amateurs, that in consequence of the success he has had in the cultivation of the above Flowers at his new Garden (where he requests an inspection of the quality of his plants), he can offer them at very moderate prices. His Catalogue of PELARGONIUMS, AURICULAS, and NEW PLANTS, is now ready, and will be forwarded by post on application. The Trade supplied.

CROSS LANES NURSERY, near BEDALE, YORKSHIRE.

WM. JACKSON AND CO., beg to state that they can still supply the following Plants, strong and well-established:—Veronica speciosa, 12*s*. 6*d*.; Tropæolum azureum, 12*s*. 6*d*.; Clematis Sieboldii, 1*s*. 6*d*.; Clematis azurea grandiflora, 2*s*. each; Fuchsias, 12 of the most approved and distinct varieties for 12*s*. 6*d*., including Exoniensis, Prince Albert, Stanwelliana, Prince of Wales, and their Seedling "Conqueror," a very fine variety, with long tube and sepals, of a fine bright scarlet, corolla salmon colour; an abundant bloomer.

A reference or remittance from unknown correspondents is respectfully solicited.

SLOUGH NURSERY, NEAR WINDSOR,
CHOICE SELECTION OF NEW DAHLIAS, 1844.

THOMAS BROWN directs attention to his beautiful SEEDLINGS, particularly that unrivalled light flower, "LADY ST. MAUR," the superiority of which over every other of its class is too well known to need further comment. Strong and healthy plants will be ready for delivery early in May.

AURANTIA (Spary's)—Orange buff; fine form and petal. A very desirable show flower; obtained numerous prizes; 3 ft. 10s 6d

ALEXANDER (Brown's)—Maroon and crimson mottled; full and constant, centre well up, and a very useful show flower; 5 ft. 7 6

DELIGHT (Brown's)—Cream, veined and tipped with purple; petal of fine substance and high centre; very distinct to any in cultivation; 4 ft. 7 6

DESIRABLE (Brown's)—Shaded buff, quite new in colour; a good show flower; 5 ft. 7 6

LADY ST. MAUR (Brown's)—White, delicately tipped with violet purple; very deep and full, high centre, forming a beautiful outline; the petals are round, and smooth at the edge; habit of Perpetual Grand: it is decidedly the finest light flower ever offered. It attracted great admiration at Windsor, and was universally acknowledged to be the finest flower in the Exhibition: 4 to 5 ft. 10 6

NUTWITH (Brown's)—Bright crimson; a fine open-cupped petal, and a good show flower; 4 ft. 7 6

RAPHAEL (Brown's)—Dark maroon, beautifully shaded with light crimson; superior petal, of excellent form: a very novel and striking variety, and will be an acquisition to any stand; 4 ft. 10 6

REMBRANDT (Brown's)—Dark purple, very round and double, rising well in the centre, and a constant show flower. It was very successfully exhibited; 3 to 4 ft. . 10 6

EMMA NOKE (Dowding's)—Blush white, good general form and centre: a good useful show flower; 4 ft. . 10 6

ESSEX BRIDE (Turville's,—Delicate peach lilac, of excellent petal and form; 5 ft. . . . (*no discount*) 10 6

LADY ANTROBUS (Spary's)—White and lilac, mottled; good form, constant, and very useful show flower; 3 ft. 10 6

NONPAREIL (Proctor's)—Ruby scarlet, of first-rate properties; extra show flower; 4 ft. . (*no discount*) 10 6

STANDARD OF PERFECTION (Keynes')—Crimson; of very superior form; 4 ft. . . . . (*no discount*) 10 6

SIR J. STEWART RICHARDSON (Union)—Brown ruby, great depth, and excellent show flower; 4 ft. (*no discount*) 10 6

T. B. has also Selections of fine Carnations, Picotees, and all other Florists' Flowers; Plants, Fruit-trees, Shrubs, and general Nursery Stock.

A general Catalogue of Dahlias, with a List of Superb New Pansies, to be had on application.

LYCESTERIA FORMOSA.—One dozen fine healthy seedling plants of this perfectly hardy, fast-growing, and free flowering shrub, so justly recommended for undergrowth, and food for game, will be sent (post free) to any part of the kingdom upon the receipt of a Post-office order for 3s. 6d. It is of early habit, and must be planted immediately.—Direct to Mr. FENN, 24, Lamb's Conduit-street, London.

WOODLANDS NURSERY, MARESFIELD, near Uckfield, Sussex.—New and Superb Fuchsias, Verbenas, Petunias, Cinerarias, Camellias, Greenhouse and Herbaceous Plants, Hardy Climbers, and Plants adapted for Bedding.

WM. WOOD AND SON beg to inform their Friends and Amateurs that a Catalogue of the above, together with a List of entirely New Roses, is now ready, and may be had GRATIS, on application at the Nursery, and in London, of Messrs. WARNER and WARNER, 28, Cornhill; Mr. JAMES CARTER, 238, High Holborn; and at Edinburgh, of Mr. ROBERT M'INTOSH, 13, Green Side-street.

KEYNES' STANDARD OF PERFECTION; DODD'S ORANGE SUPERB; DOWDING'S EMMA NOKE.—Nurserymen who can supply fine plants of these first-rate varieties, the first week in May, 1844.

LOW and Co., Clapton	GARRAWAY, Bristol
HURST and M'MULLEN, London	MEAD, Lewisham
NUTTING, Cheapside, London	WHEELER, Warminster

SPARY, Hungerford	BROWN and ATTWELL, Uxbridge
PONTEY, Plymouth	HODGES, Cheltenham
BROWN, Slough	

MESSRS. W. ROGERS & SON, FLORISTS, &c., beg to call particular attention to their splendid Seedling Fuchsias, Aquilegia and Pansy, which they are now prepared to send out by Post, or otherwise, viz.,

	PER PLANT. s. d.		PER PLANT s. d.
Fuchsia, Uttoxeter Beauty	10 6	Aquilegia Grandiflora . .	5 0
" " Rival .	10 6	Pansy, Lord Vernon . .	5 0
" Pendula Elegans	5 0		

For DR. LINDLEY's opinion, description, &c. see *Gardeners' Chronicle*, March 16th, *Gardeners' Gazette*, March 23d.

The above will be found indispensable to those intending to compete for Prizes.

Fuchsia Exoniensis, 2s. 6d. to 3s. 6d.; do. Rogersiana, 2s. 6d., with all the best kinds out.

GERANIUMS.—Lyne's Sunrise, Duke of Cornwall, Hamlet; Gaskell's Lady Sale, do. Mars; Gaines's Pride of Surrey, do. Duchess of Sutherland, do. Lady Sale; Blackford's Thunderer, do. Jersey Maid; Wilson's Count d'Orsay; Hancock's Northern Beauty. The above 12 splendid kinds for 4l. 4s., or any 6 for 2l. 10s.

The above may be had by applying to Messrs. HURST and M'MULLEN, 6, Leadenhall-street, London.

W. R. & SONS' Catalogue of Dahlias, Pansies, Geraniums, Fuchsias, Cinerarias, Phloxes, &c. &c., may be had, prepaid, by a prepaid application.—Uttoxeter, Staffordshire, April 8, 1844.

IMPORTANT TO SEEDSMEN, &c.

GREAT FALL IN TURNIP SEEDS.

J. G. WAITE most respectfully begs to inform the Country Trade that a great fall has taken place in the price of TURNIP SEEDS, and that he can supply all sorts considerably below any other house. This his Catalogues will testify, which may be had on application at his Establishment, 1 and 4, Eyre-street, Hill, Hatton Garden, London.

J. G. W. has about 300 very fine RIPLEY SUCCESSION PINES, at 1s. 9d. per plant. Any person requiring 50 or 100 will be allowed a liberal discount.

N.B.—Cash, or reference in London, is expected from unknown correspondents.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, Hothouse Builders, &c., Gloucester-place, Chelsea, beg to inform Horticulturists that they have made great improvements in their excellent and simple plan of Shading, whereby the largest or smallest can be instantly covered or uncovered with a sheet of canvas. To be seen in use at most of the London Nurseries, and at the Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

FLORIST TO HER MAJESTY THE QUEEN.

PETUNIA PUNCTATA.

W. MILLER refers the readers of the *Gardeners' Chronicle* to his full advertisement of this beautiful flower—just remarking that its *Strong, Dwarf habit*, and *Glossy Dark Green* foliage, contrasted with its lovely, large, spotted flowers (far surpassing any Petunia yet out), render it a desirable object for any greenhouse, and especially to all Exhibitors. He will commence sending out the plants on the 22d inst., at 7s. 6d. each, packed in strong tin cases, to insure their safety, to any part of the United Kingdom, post paid.

The following Nurserymen have ordered plants, and will be enabled to supply them true:—

Messrs. Henderson and Co., Pine-apple-place, London
Low and Co., Clapham, London
Wood and Son, Maresfield, Sussex
Marnock and Manley, Hackney
Veitch and Son, Exeter
Hancock and Son, Durham
Mountjoy and Son, Ealing
Sage and Son, Southampton
Jeyes and Co., Northampton
White and Son, Poole
Garraway, Mayes, & Co., Bristol
Fisher, Homes, and Co., near Sheffield
Rogers and Son, Uttoxeter

Warner's Incomparable Large, late Marrow Peas, 2s. per quart. Potter's celebrated Liquid Guano, in quart bottles. 1s. 9d. each.

VEGETABLE.—Turnip-rooted Chervil, very delicious, 6d. per paper; Potatoes, new early American, a very superior kind, 3s. per peck.

W. and W. beg to refer their friends to their list of New and Choice Flower and Vegetable Seeds in *Harrison's Floricultural Cabinet*, and the *Gardeners' Chronicle* for April and the preceding months; also to inform them they have now ready a Choice Collection of Herbaceous and Rock Plants, including all the New Varieties.

A General Catalogue of Garden and Flower seeds may be had, on application by post, as a single letter.

G. CHARLWOOD, 14, Tavistock-row, Covent-garden, begs to inform his numerous Friends and the Public in general, that his Catalogue of AMERICAN SEEDS is now ready for distribution. In it will be found Cones of Pinus Douglasii, 21s. per doz.; likewise, his new General Catalogue, containing all the newest and most improved Vegetable and Flower Seeds, together with an abridgment of the same, containing the more select and rare Sorts.

He has likewise received his annual importation of German Stocks, Asters, Wall-flowers, Carnations, &c. &c. List, with prices, will be found in the Abridgment.

G. C. having been many years in the habit of making mixtures of the different kinds of Grasses for Pasturage of all descriptions, can supply the same from 24s. to 36s. per Acre; or, in distinct Sorts, as may be desired. The finer Sorts, mixed for Lawns, at 1s. 6d. per lb. Also Lucerne, 1s. per lb. White Belgium Carrot, 1s. per lb. Altringham Carrot, 1s. per lb. Mangold Wurzel, 1s. per lb. Yellow and Red Globe Mangold, 1s. per lb. Laing's Improved Swedish Turnip, 1s. per lb. Skirving's do., do., do., 1s. per lb. All other Sorts of Agricultural Seeds equally low, and of genuine quality.

WM. JOHN CORMACK, AGRICULTURAL SEEDSMAN by Appointment to His Royal Highness PRINCE ALBERT, New Cross, Surrey, and Bedford Conservatory, Covent Garden, begs to call the attention of the Nobility, Gentry, and Agriculturists in general to his combinations of GRASS SEEDS for Permanent Pasture, the Alternate Husbandry, Parks, Lawns, &c. (as recommended and practised by his partner, the late Mr. GEORGE SINCLAIR, Author of the "Hortus Gramineus Woburnensis.") Upwards of 25,000 acres have been converted to permanent pasture by this establishment with the greatest success. Parties requiring Seeds are respectfully requested to state the nature of the soils. Mangold Wurzel, Carrot, and Turnip-seed of excellent sorts, saved from transplanted bulbs. Garden and Agricultural Seeds of the best quality and most approved kinds.

N.B.—Cormack's British Queen and Prince Albert Peas, at 3s. 6d. per quart.

GRASS SEEDS.

HENRY D. CORMACK, SEEDSMAN, &c. begs to inform Agriculturists in general that they can be supplied with every variety of the Natural Grasses, adapted to the soil, properly apportioned and combined, from his Wholesale and Retail Seed Warehouse, 106, Dean's-gate, Manchester.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	
Garden Edging	Orange Tubs, Flower Boxes, &c

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to Public competition, at the Auction Mart, Bartholomew-lane, on Thursday, April 18th, 1844, at 12 o'clock, a splendid assortment of Dahlias, Geraniums in bloom, New Fuchsias, Verbenas, Pinks, Heartsease, and a variety of other Flowering Plants. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

SPLENDID COLLECTION OF PLANTS.

MESSRS. ENGLISH AND SON have the honour to announce for SALE the WHOLE COLLECTION of ORCHIDACEOUS and STOVE-PLANTS, &c. &c., from the extensive Conservatories of JOHN JARRETT, Esq., of Camerton Court, near Bath, which they will sell by Auction, at their Rooms, Milsom-street, on THURSDAY, MAY 16th, at Twelve o'clock, punctually.

In offering this rare and beautiful Collection the Auctioneers feel that any of the usual superlative expressions in its favour, however well merited, would be unnecessary—the highly-respected proprietor having long been well known as a connoisseur of the most liberal expenditure, and of the highest taste and judgment in his selection and culture, adding, by his extensive contributions, more highly than any to the interest of the Bath, Bristol, and other Horticultural Exhibitions, and the most successful in obtaining the first-class prizes.

This genuine and splendid Collection comprises about 200 ORCHIDACEOUS PLANTS, including many very fine Specimens of CATTLEYA, IN VARIETY; several magnificent ARAUCARIAS EXCELSA; about 500 RARE STOVE PLANTS; and about 100 of the finest ERICAS, &c. &c. The whole will be found to be one of the very choicest assemblages of Floral varieties ever offered to public competition in the neighbourhood of Bath, there being not a production among them but would be an acceptable addition to the garden of any gentleman in the kingdom.

Catalogues are in preparation. Further particulars in next Advertisement.

TO GROWERS OF ORCHIDACEÆ.

MESSRS. J. C. and S. STEVENS beg to announce they will sell by Auction at their Great Room, 38, King-street, Covent-garden, on WEDNESDAY, April 24, at 12 o'clock, the valuable collection of ORCHIDACEOUS PLANTS, the property of Valentine Morris, Esq., of the Retreat, Battersea, amongst them will be found many fine examples of the rare varieties in the finest health: they number about 200 specimens. May be viewed the day prior and morning of Sale, and Catalogues had of the Gardener on the premises, and of Messrs. J. C. and S. STEVENS, 38, King-street, Covent-garden.

TO GENTLEMEN, FLORISTS AND OTHERS.—A FINE COLLECTION OF CARNATIONS, DAHLIAS, FUCHSIAS, GERANIUMS, AND MISCELLANEOUS PLANTS; THE PROPERTY OF MR. ALEXANDER, LAMB FARM, KINGSLAND.

TO BE SOLD BY AUCTION, by MR. JAMES IZOD, at the Auction Mart, Bartholomew Lane, on Wednesday, April 17, 1844, at 12 for 1 precisely.—The *Dahlias* comprise Perpetual Grand, Blue Bonnet, Essex Triumph, Madeline, Antagonist, Mrs. Shelly, Victory of Sussex, &c. The *Fuchsias* Exoniensis, Britannia, Cormackii, Champion, Defiance, Gem, Prince Albert, &c. *Carnations*—Martin's Splendid, Hepworth's True Briton, Chadwick's Brilliant, Bonnie Bess. *Geraniums* in all the leading varieties. May be viewed the morning of sale. A Catalogue may be had at the Mart, and of Mr. Izod, 2, Castleford Court, Throgmorton Street, City.

PICOTEE CAPS.

TO BE SOLD, a few dozen at 9s. a dozen, quite new, and well made, painted green, and zinc tops. To be seen, after 5 o'clock, at Mr. CHAPMAN'S, near Holland Chapel, Brixton-road, near Kennington.

AN EXCELLENT FAMILY RESIDENCE DETACHED.

TO BE SOLD OR LET very reasonable, fit for immediate occupation, on an eminence, with the most extensive and beautiful views, and about 14 acres of superior Meadow, Garden, and Pleasure Grounds, Hot and Greenhouses, Stables, double Coach-house, &c. &c., about 4 miles south of London. The House contains lofty Drawing-rooms, Dining-room, Library, double Entrance Hall, ample Bedrooms, Servants' Offices, &c. Apply to Messrs. WINSTANLEY, Paternoster-row, or Messrs. BARRON & CULLEN, 29, Bloomsbury-square.

TO BE SOLD.—A HIGHLAND COW.—A White Highland Cow, of the purest Argyleshire breed, for address, apply (if by letter post paid) to B., Mr. Briggs, 27, Piccadilly.

UNIVERSITY COLLEGE, LONDON. — ELEMENTARY COURSE OF BOTANY.—Professor Lindley will commence a Course of Lectures on Botany to a Junior Class on Tuesday, April 16.

"Science."—The distinctions between the principal Natural classes and orders of plants belonging to the Flora of Europe. The Course is adapted for persons commencing the study of Botany. Fee 2*l*.

The Course to the Senior Class will commence early in May.

Further particulars may be obtained at the Office of the College.

P. S. Carey, A.M., Dean of the Faculty of Arts.
Thomas Graham, Dean of the Faculty of Medicine.
Charles C. Atkinson, Secretary to the Council.

April 1, 1844.

MEETINGS FOR THE FOLLOWING WEEK.

Tuesday, April 16	Horticultural	. .	3 P.M.
	Linnæan	. .	8 P.M.
Wednesday 17	Society of Arts	. .	8 P.M.
	Microscopical	. .	8 P.M.

[Friday, April the 19th, Royal Institution, Mr. E. Solly.—"On the Chemistry of Vegetation, and its Application to Agriculture."]

Now that the world has been sufficiently misled by assertions, speculations, or crotchets, and that money enough has been spent in looking for improvements blindfold, the value of well-conducted experiments is beginning to be felt, and the importance of theory in suggesting them to be recognised. We do, indeed, sometimes hear even now of a man's trying to do something new, merely for the sake of trying; and cases, doubtless, occur where chance, rather than reason, is looked to; but such instances are few, and not worth notice. Good experiments, wisely planned, skilfully conducted, and carefully worked out, with the strictest attention to the results, are now regarded as the sheet-anchor of improvement, in the all-important art of cultivation. The value of such men as Hales and Knight is felt, and none but blockheads sneer at men for spending their time in experiments, or ridicule them because they fail. Success is only to be obtained by means of failure: if it were otherwise, experiments would not be wanted.

Great Britain is now becoming one great scene of such exertions. Everybody interested in Gardening and Farming is opening a little campaign of his own, and it is to be hoped that, by the autumn, our letters will give us intelligence of a good many strong places taken, and permanently occupied. Our war may be less exciting than that of Algiers, but it will be as glorious.

It is, of course, to public establishments that the public looks for the initiative, as they call it, in these matters; and the Garden of the Horticultural Society is one, in particular, in which they are to be expected. The last Part of the Transactions of the Society contains the details of some of these experimental inquiries; a report on others is in progress; and, in the meanwhile, the Garden will this season become the scene of new operations. In order that the public may know what to inquire about at the Garden, or that those who wish to try the same experiments for themselves may do so, we have obtained permission to mention in our columns, from time to time, the principal trials that are in progress.

The great experiment of the season will be an examination of the results obtained by Mr. Campbell and others (see p. 57), by soaking seeds in various chemical solutions. For this purpose Mr. Edward Solly has selected a number of the most important common seeds, which have been sown in similar soil, after having been steeped in various saline solutions. Some of the seeds were sown without any preparation, some were steeped in pure water alone, whilst the remainder were steeped in solutions of different salts. These experiments will show what effect the various steeps have on the germination of the seeds, and also to what extent they influence the subsequent growth of the plants; and thus it is hoped that the conflicting statements respecting the action of steeps will be fairly examined. Mr. Solly's experiments on Wheat, which excited so much interest last year, are again repeated on the same ground. Each plot of Wheat is manured with the same simple manure as was applied last year; thus a fairer and more correct result may be anticipated, as the soil having been to a certain extent exhausted or weakened by last year's crop is in a better state to exhibit the effects of each individual manure, and it will be seen whether simple saline substances will maintain the fertility of land year after year, if annually repeated. Ground on which Potatoes were grown last year with saline manures will this year be cropped with Barley, in order to ascertain the influence which those substances applied last year to the Potato have had on the soil, and how far the Potato-crop exhausted it.

In the Arboretum superphosphate of lime has been employed upon Grass as a top-dressing, and upon trees and shrubs, in places that are greatly run out. This substance has been administered in the proportions of one or two ounces to a plant when removed, according to the size, and it has also been dug into the borders at about the same rate.

A collection of crimson early-flowering hybrid Rhododendrons has been planted at the back of a north wall, with a view to ascertaining whether by thus retarding their spring growth they may not become much hardier than they now are.

Some very singular and unexpected results were last year obtained, by increasing the daily rate of growth of plants in a hothouse, as has been reported in the last part of the Transactions. In order to ascertain how far the same results are to be expected from plants growing in the open air, the following trial is to be made:—A Vine, a Fig, a Sweet Willow, plants experimented with last season, and, in addition, a Jerusalem Artichoke and Scarlet Runner have been planted in rich soil in front of one of the Vineries. When fairly started it is intended to register their respective growths during three equal portions of the 24 hours, the observations being made at 4 A.M., 12 noon, and 8 P.M.

Calico screens, prepared with Whitney's composition, have been employed in front of Wall-trees for protecting the blossoms.

As manure for Onion crops, Charcoal-dust has been applied at the rate of 1½ peck per rod; superphosphate of lime, at 5 lbs. per rod; Potter's guano at 3 lbs. per rod; soot 3 lbs. per rod; and a mixture of 1 of salt and two of soot, in rather less quantity than that of the preceding application.

A Vine border has been covered with a roof of black asphalte sheeting, with a view to determine whether, by thus keeping off cold rain on the one hand, and absorbing heat on the other, the Vines will be maintained in a more steady rate of growth. This is also done for the purpose of ascertaining how far such a material can be substituted for hot stable-dung, as employed for the same purpose by Mr. Roberts and others.

It is a well-known fact that the Diseases of Plants, like those of animals, are occasionally epidemic, prevailing over the vegetation of large districts; and the question has been often asked—Are they *contagious* or *infectious?*—Are they propagated by matter engendered in one individual and communicated to another? We shall endeavour to answer these questions; and we think that the conclusion must be arrived at, from the evidence before us, that the diseases of plants may be, like those of animals, produced by contagion.

Amongst animals, diseases are engendered by the application of organic matter in three forms:—1st, that of animals, as in the case of the itch-mite, rot-worm, and the various forms of epizoa and entozoa; 2d, that of vegetables, as in the fungi of scald-head, the confervæ of impetigo, and other cutaneous diseases; 3d, that of organic cells, which do not give evidences of the possession of a specific animal or vegetable life, as in the case of small-pox, measles, scarlet fever, typhus fever, &c.; and it is these diseases which are most frequently epidemic.

The same agents are capable of producing diseases in vegetables. The attacks of the aphis, the scolytus, and other insects, are well known as producing extensive destruction of herbs and trees over large districts; and the most frequent pestilences that desolate the cultivated plants of our fields are produced by various forms of fungi. The agency of fungi is so great in producing blights, that some writers have been inclined to attribute all the diseases of the vegetable kingdom, not produced by insects, to this cause; and the peculiar characters which the cells of plants assume under disease have been named as though they were so many species of fungi. We are indebted to Unger, a German botanist, for having pointed out this error, and the real source of the supposed forms of fungi. There is not, however, any doubt that the greater number of the most destructive pests of our fields—as those known by the names of smut, brand, mildew, rust, &c.—are produced by the introduction of the seeds of fungi into the tissues of the affected plants. With the history and nature of these, we are happy to say we shall be able to make the readers of the *Gardeners' Chronicle* acquainted, through the able pen of the Rev. Mr. Berkeley.

These cryptogamic diseases of plants must be regarded as contagious, since they are produced by the contact of one portion of organic matter with another. But the diseased cells of a vegetable are capable of communicating their diseased action to healthy cells, just as the cells from an animal affected with small-pox are capable of giving that disease to another. If a healthy plant of Cactus be inoculated with some of the fluid from a plant affected with *moist gangrene*, diseased action will immediately commence, and extend more or less rapidly according to the condition of the plant thus inoculated; and this is the case with some other forms of vegetable disease. The kind of action thus established is analogous to that which occurs when a small quantity of ferment is introduced into a saccharine fluid, the consequence being the impartation of a new character to the particles of the fluid, and an entire change in the relation of its chemical constituents. In order that diseases may be thus produced, it is not necessary that the contagious matter be conveyed from one plant to another in a tangible form, but the diseased cells may be conveyed through the medium of the air, in the same way as the sporules of fungi which produce blights.

In treating of contagious diseases, or those produced by animals and plants, most writers have paid almost exclusive attention to the agent producing the disease, not taking into consideration the condition of the plant attacked. In human beings it is well known that only a small proportion of persons exposed to the influence of contagion will take the disease that it is calculated to produce. There is, in fact in both animals and plants a condition of the tissues of the individual, brought on by circumstances, which favours the production of disease, and it is alone in our power over this condition that we can expect to control the visitation and destruction of epidemic diseases. That such a condition of plants exists is, we think, proved by the fact that epidemic diseases arising from the attacks of insects and fungi do not occur in the same districts in following years, although there can be no doubt that there are more of the seeds of disease,—as the ova of insects, the seeds of fungi, &c., in the vicinity of crops, in the year following an attack of the disease, than in years either previous or subsequent to the attack. We think, then, that there is reason to conclude that there are constantly in the atmosphere germs which are capable of producing disease in a plant, provided the plant gets into a condition to be attacked.

The circumstances that would produce such a condition of a plant as to render it liable to the development of epidemic diseases, are of a general nature. The state of the atmosphere in relation to moisture, the prevalence of unseasonable, hot or cold weather, the amount of light, and probably the electrical condition of the air and earth, are the circumstances which act on plants generally, and which may produce a state in which insects, fungi, or organic germs, may generate disease.

A more limited cause of predisposition to contagious disease is the natural decay of a plant or parts of a plant. Thus we find that the leaves are more exposed to the attacks of fungi just before the fall than at any other time. The trunk and branches of a tree become most frequently gangrenous when they have attained maturity. Soft fruits—as Apples, Pears, Oranges, Melons, Grapes, &c.—are more exposed to the attacks of disease the riper they get. Ripe fruit is already entering into a state of decay, and this process is hastened by the introduction of the seeds of fungi or the cells of diseased tissue.

Can the epidemic diseases of plants be averted? We think in some cases they may, and in others very much mitigated. We cannot control the sun and the wind, nor prevent electrical accumulations and escapes; but we may act in anticipation of their influence, and, if we cannot altogether prevent the occurrence of epidemic diseases among plants, we may do much to prevent their destructive consequences. Plants which have the most perfect health will always withstand depressing or exciting influences best, and the most carefully cultivated farms and gardens will always be those which, in the long run, will suffer least from blights of any kind. It is not our object here to point out the means of keeping plants in a healthy state; but we would say to farmers and gardeners—Take all care that your plants are healthy; be careful of stimulating them with heat, light, water, or manures; be equally careful of depriving them of a sufficient quantity of these things; and guard against poisoning them by noxious gases or improper manures. The influence of particular varieties of plants, and the age of them, in producing disease, we shall discuss in a separate article.—*L. E.*

FUCHSIAS.

(*Continued from page* 212.)

The last Paper recommended young plants which are found in a defective state of bottom-drainage, or in too retentive a soil, to be first excited to a healthy circulation of moisture, and then to be removed to 48 and 32 pots, or larger in proportion to their vigour. Well established plants in small 60s, of the present year's growth, may be removed to 24s, to be therein established prior to receiving a larger or final shift.

A difference of opinion exists as to the fitness of peat for Fuchsias. In the Natural Order, Onagraceæ, to which the genus belongs, it is found, in connexion with other genera characterised by requiring loam principally for their growth. Judging from those plants, to the cultivation of which peat is essential, such as Heaths, Epacrises, Pultenæas, Dillwynias, &c., it will be found that the habits and structure of the Fuchsia are very opposite. Therefore loam, with its usual accompaniments of leaf-mould or decomposed manure, may be considered as the most natural material for the cultivation of Fuchsias in pots. The fitness of peat depends upon the conditions to which their growth is subject, and will be alluded to hereafter.

That the perfect condition of this genus depends upon a partial exclusion of intense sun-light, must be known to all who have experience in its culture under artificial means. If a plant is placed in the open ground where it is exposed to intense light for only half the day, its foliage and flowers will be much more perfect and healthy than when they are exposed to the unintermitting glare of a summer's sun. Again, place two plants under equal conditions of exposure to intense sun-light, and give one a screen for a few hours each day, or grant it but the boon of a gentle syringing morning and evening, when sultry, and in this, as in the former case, the benefit of a partial shade and cool atmosphere will be sufficiently obvious. The genus, in fact, consists of beautiful under-shrubs, in their native country occupying at one time the fore-ground of lofty and luxuriant vegetation, and at another gracing shady recesses and streams.

Though the general habit of this favourite plant is such as to enable it to withstand exposure better than many others, it is only on condition that the supply of moisture is equal to its rapid absorption. When properly treated, few plants better deserve the character of "gross feeders." The essential conditions required for its "perfection of beauty" are heat, shade, and moisture. It is also capable, to a great extent, of assimilating food from materials in a gross and partially-decomposed state.

Bottom-heat is not essential further than as a means of maintaining a uniform and humid atmosphere. The period from which the present paper dates (March) is one which all who possess a Vinery or forcing-house may render convenient for its earliest growth. Where the communication of heat interferes with a maintenance of the necessary moisture, by the pipes or flue being too near the stage upon which the plants are placed, the following means are efficient in this and all similar cases. Where occasional excessive humidity is required for the young growth of plants, a platform of trellis-work is preferable to one of slate or stone. Fill up the interstices of the trellis-work with Moss (wedged in longitudinally), and over the entire surface add a heavy layer of the same material (the latter having been repeatedly immersed in boiling water, or heavily watered, in order to destroy slugs, &c.); over this place inverted pots or pans, upon which the plants are placed, their elevation being in proportion to the absence of light in front, or its distance above.

If it is necessary to raise the material, place bricks flatways at each end across the platform, to the elevation wished for, and add a bead, or curb, on the side next the path; then fill up with Moss, as before; and, in order to give a neat appearance, finish with a surface of coarse river sand or coarse gravel. By watering the surface of these materials an atmosphere will be maintained sufficiently humid for Fuchsias, Calceolarias, Lobelias, &c. &c. to luxuriate in during the early spring months, and capable of counteracting the injurious effect of dry, intense heat.
—*William Wood, Pine Apple-place.*

(To be continued).

ON THE CULTIVATION OF THE FIG.

IN compliance with the request of several of my friends, I publish my mode of managing the Fig, for the benefit of amateurs and young beginners; and if the following simple rules are strictly attended to, I am confident that the result must be abundance of delicious fruit with them, as it has been with me here, for the last fourteen years, where there is a good Fig-house, and many plants in pots.

The Fig-wall here is not extensive; but I will commence with it, as it is of greatest importance to the amateur, and those who have little or no glass. I have tried several aspects for the Fig, but I find the south-east to be the best. I have likewise tried several sorts, but, finding them all inferior to the Nerii, I have discarded all others from the open wall. The best soil for this fruit is sandy maiden loam and turf mixed together, without manure of any kind, over-luxuriance being a great evil in their culture. I would advise all who are about to plant a Fig-wall, to form the borders about three feet wide and three feet deep, having a good drainage of any rough material. At the front of this a wall four inches and a half thick, running parallel with the other, should be brought up to within two inches of the surface, the intervening space being walled across, so that each tree may have its own division. This prevents over luxuriance, and causes them to fruit more freely. Any old trees that are growing strong and that do not bear well, might have their roots pruned back in autumn, and walled in as above described. By doing this early, it would afford the tree time to provide itself with new feeders; and by opening a trench in the front of the wall, about the end of March or beginning of April, and applying a pretty brisk lining of leaves and long litter for a few weeks, it would greatly assist the crop for that season, and establish the trees for the following. Water occasionally with soft water, and after the fruit has attained three-fourths its size, two or three good waterings of liquid manure will assist materially in bringing the fruit to a larger size.

With regard to training, it is of minor importance; but as most people are desirous of having a uniform system, the accompanying figure represents a fine tree of the Nerii; the other exhibits a mode of training equally suitable for the Fig against a wall. The walls here are not flued, and consequently the trees derive no assistance from any but solar heat. My system of pruning is merely to thin the branches where they are too thick, and to admit plenty of light and air. The points of any branches that indicate too luxuriant a growth, are pinched out. The tree will show how young bearing wood is procured when the branches get too long, or begin to have a naked appearance. What I use for covering the Fig in winter is a double thickness of old mats, with a little mulching; a wide coping on the wall is very essential, and a canvas covering drawn over them at night in the early part of their growth is of great benefit to them. If it is desirable to increase the stock, if cuttings of well-ripened wood are taken off in spring, and potted singly in small pots, plunging them in a warm Cucumber-frame, and re-potting them two or three times, they will attain a large size in one summer. With these cuttings, as with the trees at all ages, bottom-heat and water is everything.

Fig. 1.

Fig. 3.

Fig. 1 is taken from a fine tree of Nerii, at Hewell. 2 shows where the long branches are cut back to produce young wood.
Fig. 3 is taken from a fine tree that I had the care of many years since, which looked remarkably well when growing in summer. 4 merely shows where the laterals are tied to the old wood.

The Fig-house—At this place is a structure entirely devoted to the growth of the Fig; it is 33 feet long, 14 feet wide, and 11 feet high at the back, which is trellised with wire, two inches from the wall. The trees on this wall are all fan-trained; the roots are walled in, as recommended for the open wall, excepting that the spaces are narrower, being only two feet wide, and two and a half deep; the path leading through the house rests on this partition wall. Between this path and the front is a border for small standards and circular-trained trees, ranging from three to five feet high; these are all walled in with rough stones, for the same purpose as already stated; the sorts in this house are the Nerii, brown Ischia, large white Genoa, and one called Kennedy's Fig, but the greater part is the Nerii. I generally prune them in the latter part of February, but this is a very trifling operation where they have been properly attended to in summer, being only to cut out here and there a superfluous shoot, or to shorten one back to any naked or unfurnished part, in order to procure a supply of young shoots. I then have the whole forked over between the trees, giving them a good watering with pure water. After this is done small fires are lighted, keeping the temperature at 50° Fahr., and syringing morning and evening with tepid water. Air is given plentifully in fine weather, and when the fruit begins to grow, the temperature is raised to 55°, then to 60°, and so on progressively, about the same as for Vines. For the first six or seven weeks water is given only in such quantity as to keep the soil moderately moist, but afterwards more freely.

When the fruit is about half grown, I commence watering freely every morning, and generally about twice a week with liquid manure, which I find of great service. As soon as the young shoots have attained the length of four or five inches their points are pinched out; this shoot is what we call the "second crop wood" for the latter part of summer, or autumn, according as the forcing was commenced early or late. During the growth of the second crop of fruit the tree produces a second shoot, from three to six inches long, which, when properly ripened, contains the crop in the embryo state through the winter for the following spring. A short time before the first crop of fruit is ripe, the watering overhead is discontinued, and abundance of air is given; when the Nerii begins to ripen, the sugar will drop from the fruit down the leaves like honey; in short, the fruit of the first crop has considerable resemblance to small bladders of honey. As soon as practicable, the watering overhead is again resumed in every part of the house where the fruit is not approaching maturity. The succession of fruit in this house generally lasts about four months. The winter management here is merely to keep the borders moderately dry, and to prevent frost from entering. Where houses are about to be heated with hot water, above all things have a pipe to run under the path at the back in a sort of gutter; the pipe may be laid five or six inches under the level of the border; this has a very beneficial effect on the Fig, even under Vines; with this they bear most abundantly, and with great certainty. At Sir H. H. Goodrich's, at Studley Castle, two Vineries were planted at the back, as above described; and, last year having several opportunities of seeing them, I was much pleased with the abundant crops of fine fruit they produced; and Mr. Dytch, the gardener, informed me that these two houses had supplied them well all the summer and autumn.

Culture of Figs in Pots.—Those who wish to force Figs in pots should have their plants examined as early in the autumn, or winter, as possible; and those plants that have got their roots much matted together should have them reduced and potted in sweet maiden loam, ready for the spring forcing in January or February, as they may be wanted. The pots should be plunged in a half-spent tan or leaf bed, either in a pit or forcing-house. If neither of these can be had, prepare a small bed of leaves and manure, and place a deep frame over it, plunging the plants to such a depth as to enable the roots to have 5° or 10° more heat than the tops. By doing this the roots are put in action first, which causes the embryo fruit to come forth in such a strong, healthy manner as will ensure a good crop after the fruit is fairly shown; the plants may then be removed to any forcing-house where they can have plenty of light and air,—if they can be plunged in gentle heat so much the better. It should always be borne in mind that the Fig, in a growing state, is almost an aquatic, therefore little danger is to be apprehended from over watering, but serious mischief may arise from not attending to this; for, if ever the soil gets thoroughly dry when the fruit is far advanced, some evil will be sure to result from it.—*I. Markham, Hewell Gardens.*

ON THE CULTIVATION OF GRAPES IN POTS.

(*Continued from page* 213.)

The next consideration is the time when you wish your Grapes to ripen; this being ascertained, it is easily known when forcing ought to commence. It may be stated that Vines under the above-mentioned treatment will be ready for forcing early in November, and consequently will ripen their crop by the end of March. As the principal use of Vines in pots here are kept to occupy the houses (where Vines are planted on the outside) during the period that they are inactive, say from November to May, those in pots are generally forwarded in their first stage in any pit or house whose temperature may happen to suit them, and, finally, when the wood of the permanent Vines is sufficiently ripened to allow of their being placed outside, the pots are taken in and arranged in their places on shelves put up for the purpose; by these means the houses are of far more use than if they remained empty nearly half the year. However, the precise mode in which the Vines are to be fruited depends on the kind of houses the cultivator has at his command; a flued pit answers well; but the best description of houses is that which admits the rays of the sun to pass through it in the winter at as near right angles as can be. Such a house, admitting considerably more light during the winter months, is much more suitable for such a plant as the Vine than low flat houses. Whatever the house is, if not perfectly ready for the Vines when you wish to begin forcing, get them placed in a dung frame where you can give them a moist heat of 55°, this will cause their buds to swell regularly, and prepare them for their removal to the fruiting-house, when ready, without losing time. Previous to losing their leaves in the autumn, they may, if thought advisable, be disbudded on Roberts' system, leaving a few more buds than you want bunches; but one objection to this system is, that if by any accident through the winter the bud should get injured, it leaves a blank which, had the next buds remained, might easily have been supplied.

The number of bunches that may be left on each Vine will depend on the soil, size of the pot, &c. When the Vines are strong, and No. 2 pots are used, I usually leave six or seven bunches on the Hamburgh, the same on the Sweetwater, and one or two more on the Muscadine. If the Vines are not so strong, four or five bunches on the Hamburgh will be sufficient. It is much better to have rather fewer bunches and the berries fine and well coloured, than ill-coloured puny bunches, which always is the case when too many are left on the Vine. The Vines from being placed in the house, presuming their buds to be swelled, must have their temperature raised from 55° fire-heat to 65° when in bloom, and it will be better if this heat by night is never exceeded; of course on all days when there is no likelihood of sun-heat, the heat of the house should be raised 5° or 10° by artificial means. Air should be admitted by some means or other *every day* early; this is of consequence, or the leaves are apt to get damp and their texture being so extremely thin, when the hot sun and drying winds of March act on the foliage, they often burn and shrivel, and consequently are unable to swell off the fruit or give it colour. During all the time the Vines are in a fruiting state, manure-water in some shape or other must be frequently given. Dung-water is made of various ingredients, but in whatever way it is made, it ought to ferment before using and should be applied in a pure state, and at a temperature equal, at least, to that of the house. The draining from farm-yards is always good and safe. I use manure-water, made by pouring nearly boiling water on equal parts of sheep or deer dung and fresh horse-droppings; this is fined by a lump of fresh lime, is drawn off clear, and when used is diluted with equal parts of rain-water. A very weak solution of guano is beneficial, but great caution is required in using it. It is astonishing during the period of active growth, what an immense quantity of dung-water Vines will take. I have frequently watered them twice a day with it, and this I prefer to placing bottom-pans or feeders under the pots, as is often done. If the dung-water is properly cleared and diluted it may be given twice for fresh water once: when the Grapes are fully swelled, and beginning to colour, water must be more sparingly applied, using clean water only. The flavour of Grapes is often spoiled by being over-watered when ripening their fruit, by the proper proper

tion of carbon and water, which constitutes the saccharine matter in Grapes, being destroyed and water formed in excess.

When the fruit is ripe, if the house is wanted for other purposes, the plants may be removed to any dry house or room, where the Grapes will keep until wanted.

The varieties I have found best for early forcing are, the Hamburgh, Dutch Sweetwater, and Muscadine. The small-berried varieties, as the Esperione and others, are hardly worth growing, compared with the above. Muscats, and all the delicate sorts, as the Frontignan, answer admirably later in the season, and thus the amateur and those who possess but a small extent of glass may cultivate all the varieties of Grapes procurable in British nurseries, at but a trifling additional expense.

Although I have given directions how to render fruitful Vines in one season, yet, when a stock is once acquired they may be kept for years in a fruitful state, by resting them at alternate seasons. Thus those plants which have fruited in spring may be turned out of their pots into a border, where they will require no farther trouble until the following spring, when they may be taken up, their roots reduced in some degree, and placed in pots again, planting them deeper than they previously were: they may then have the same management as young plants, and will make very strong canes in the course of the summer. I have Vines in pots now in fruit that have borne three or four previous crops. Where the cultivator prefers boxes to pots, they may be used, from 14 to 16 inches square, which will be quite large enough; they can be packed on shelves more closely together than pots, and are more handy to move about.

By the above process Grapes may be procured by the end of March and April, without interfering with those planted outside, and I would particularly recommend its adoption by amateurs possessing small establishments, as affording them a means of prolonging their Grape season; besides being productive of gratification and pleasure. It is to this class of gentlemen in particular that I wish the foregoing remarks to be addressed. Although it would be a considerable addition to small places, yet in the large establishments at Tedworth, under Mr. Sanders, and at Tottenham Park, (Mr. Burns) it is an essential feature in their management, and is followed with the most complete success. I imagine the credit of growing plants in one season and fruiting them the next belongs to Mr. Tillans, of Alnwick Castle, who adopted that practice at Woodchester Park, when gardener to the late Lord Ducie.—*John Spencer, Gardens, Bowood.*

FAMILIAR BOTANY.

Morphology.—No. XI.

Nature, the daughter, ever-changing birth,
Of thee the Great Immutable, to man
Speaks wisdom; is his oracle supreme;
And he who most consults her is most wise——
Look Nature through, 'tis neat gradation all.
By what minute degrees her scale ascends!
Each middle nature joined at each extreme,
To that above is join'd, to that beneath.
Parts into parts reciprocally shot,
Abhor divorce. What love of union reigns!

We have now taken a great step in our subject. We have proved that a leaf is a metamorphosed cotyledon, and that a cotyledon is an imperfect leaf. We have shown that the leaf may exist in two very dissimilar conditions, according to the degree in which it is developed; and it is easy to conceive that it may equally occur in any number of other conditions; as, in fact, is obviously the case if we open our eyes wide enough to look into the great field of Nature. Instances meet us at every step. In the Scotch Fir, for example, there are two sorts of leaves; the first-born annually are very thin, narrow, colourless, and perishable, not existing in a living state more than a few weeks; the next-born are stiff, needle-shaped, deep-green, and live for months or years. The leaf of Grass is a thin, narrow ribbon; that of the Horse-Chesnut divides into large, stout fingers. Mosses have their foliage so small that it can hardly be seen without a microscope; in the Fan Palm-tree one leaf is large enough to thatch a house. Both the Nut-tree and the Sycamore have generally green leaves, but the one is sometimes purple and the other yellow; while the Kail-plant assumes the colours of the gayest flowers. The leaf of the Beech-tree becomes almost as dry as paper, that of the House-Leek is as fleshy as an Apple. The Oak-tree has thin, flat leaves, with an upper and under surface; but in the Stonecrop they are cylindrical and succulent, with no distinction of surfaces. It is unnecessary to multiply such instances; those which have been enumerated suffice to show that what is called the leaf of a plant is not to be known either by its uniformity in the same plant, or by its outline, size, colour, texture, solid figure, or any other of the qualities which the multitude assigns to it.

What then is a leaf? *A leaf is an expansion of the surface of a plant, arranged in some regular order as regards other leaves, and either producing, or capable of producing, a bud in its axil* (that is to say, in the angle which it forms with the stem). This being premised, I must next endeavour to show, not only that many kinds of leaves occur in different plants, but that the leaf occurs in wonderfully different states in the same plant, and that the irregularly varied aspect of vegetation is chiefly owing to that cause.

Let us proceed in our examination of the garden Pea, which I take because it gives every one the opportunity of following my observations.

If, when the seed-lobes have burst through the skin, we observe the condition of the plumule, it will be found to be soft, rather angular, and covered by many minute scales placed near together, but in a regularly spiral manner, and each consisting of a thin plate of cells expanded from the surface of the plumule. These are the beginning of new leaves; they are repetitions, upon the surface of the plumule, of the scales which appeared upon the embryo when it was in process of organisation. By degrees the plumule lengthens, and gradually the tiny almost invisible scales will have been transformed into verdant leaves. If we now examine the state of those leaves, we shall find the first, *a*, to be a trident-like scale, with a bud in its axil, the side lobes being anticipations of stipules, and the middle prong the beginning of a leaf-stalk—the plant is young and feeble. The next leaf, *b*, is rather larger; the

side lobes are broader and a little notched; the middle prong is, however, scarcely changed—the plant is still weak, and incapable of producing perfect organs; but it is stronger. The third leaf, *c*, shows a great advance; its stipules are perfect; the middle prong has formed two leaflets at its end, and has extended itself beyond them into a little bristle, which is the beginning of a tendril—the plant has almost gained its natural vigour. At last, at the fourth stage, *d*, the plant has formed its perfect foliage; the stipules are larger, the leaf-stalk is complete, the leaflets are notched and spread open to their full extent, and the tendril is lengthened, branched, and ready to cling to the first object that it touches for support.

Now, see what metamorphoses are these! If you place *a* and *d* side by side, you would not believe them to be the same thing; and yet we have had the plainest possible demonstration that the one is the same as the other in a different state of growth; that the little three-pronged scale which we hardly see, is as much a leaf as the tendrilled full-grown organ placed above it. How true, then, is it in fact as well as in theory, that Nature always proceeds from imperfection to perfection!

But the vigour which the plant has acquired ceases with its youth. By degrees we shall see it become feeble again, unable to expand its organs of growth, and, returning to its early weakness, producing scales for leaves, and out of those scales fashioning its flowers and its fruit.

Home Correspondence.

Gloxinias.—These generally receive the same treatment as other tropical plants, and many persons who have not the convenience of a stove, have been deterred on this account from cultivating this lovely genus. Gloxinias can, however, be cultivated where there is only a greenhouse or a frame, to greater perfection than when they are grown in a higher temperature. The Gloxinia requires a season of rest and another of growth; the roots should be allowed to become quite dry during autumn, and continue so all the winter; they should not be allowed to become dry, however, all at once, but by degrees. While they are in this state the pots may he laid on their sides on a dry shelf in the greenhouse, until February or March, but February is the best time for starting them. In potting them the earth should be carefully shaken from the bulbs, which should be repotted in a mixture of one half decayed vegetable mould, and one half good rich loam, with the addition of a little sand or charcoal. The pots should be well drained. In planting, press the roots gently on the surface of the soil, and give them no water for some time, as the moisture of the pot will be sufficient for them at first. After they are all potted, remove them to a frame where the temperature is about 60°, and when they have commenced growing, give them a little water, increasing the quantity as they advance in growth. A little air should be given them in fine weather. By the middle of May they will have attained a good size, and some of them will be showing flowers, when they may be removed to the greenhouse, where nothing, except proper attention to watering them, is required. When the plants have done flowering, water should be gradually withheld. It often happens, however, that some of the species continue in a growing state all winter; for instance, G. caulescens, which is unlike any of the others in habit and manner of growth. The Gloxinia is readily increased by seeds and cuttings; the seeds should be sown very thinly as soon as they are gathered, in pans that are well drained, and filled with a mixture of fine peat and sand; the seeds should not be covered; they may afterwards be placed in a frame where the temperature is about 60°. When they have acquired one or two leaves they should be potted off into small pots, and not dried off until the second year, as the small fibres are not sufficiently strong to cause them to grow vigorously in spring. This remark is also applicable to young plants raised from cuttings. Gloxinias are readily propagated even by a single leaf pressed firmly into the soil, which may be the same as is used for seeds. I have struck them, but with difficulty, in bottles of water, in the following manner:—Having detached a leaf from the stem with the bud entire, I immersed the leaf-stalk in the water, and placed the bottles in a temperature of 80°. In a few days there was found at the base of the stalk a curious protuberance from which the roots issued, which were extremely fine and delicate. After the roots had grown a little the plants were potted off in the same mixture as is mentioned above for seeds. With regard to kinds for a private garden the following may be recommended: G. coccinea, Youngii, Manglesii, rubra, maxima, speciosa, and candida. If the above directions are attended to, these beautiful plants will find their way into many gardens in which they are at present strangers.—*J. McI., Hillsborough.*

The Forget-me-Not.—There is a little common plant which grows in our woods and adorns the banks of our rivulets, the unassuming beauty of which is acknowledged by all; I mean the common Myosotis, or, to give it its more familiar and more expressive English name, the Forget-me-Not. There is a charm about the very name which tells of friendship and constancy in a fickle world; and though Shakspeare asks "What's in a name?" and adds, "A Rose by any other name would smell as sweet," yet there are many of our common plants which, if they were divested of their old names, would with them lose the power which they possess of calling up old associations, to which very much of their interest is owing. But what I wish to call attention to now is the fitness of this plant for bedding out, for planting in masses in the front of Shrubbery borders, and more especially for winter forcing. It has long been used for bedding out at this place with the happiest effect, and where masses of blue colour are required few plants excel it. It costs little trouble, and continues in flower nearly all the summer. While the almost countless varieties of Verbena furnish us with every shade of red, plants of a blue colour fitted for small beds are scarce. No plant better repays the trouble of forcing than this. It is only necessary to take up the roots from the border where they are growing, divide them into small pieces, plant them five or six in a small pot, and place them on a spare shelf in any house that may happen to be at work. In three or four weeks afterwards they will begin to display their pretty little blue and yellow flowers, which in a nosegay greet us like old friends, and by their associations with pleasant rambles, shady woods, and sunny skies, give rise to pleasurable sensations in the mind, which are not produced by the more gaudy colours of exotics.—*W. H. M., Trentham.*

Annoyances.—About 10 years ago a neighbour of mine (and a very good neighbour he was) kept a large quantity of pigs, which were in the habit of finding their way into my nursery, particularly on Sundays. Whenever my good neighbour met me, he always apologised, and said he had given strict orders to his bailiff to take care the pigs did not trespass again. The way in which the pigs got into the nursery was through gaps in the hedge which were made by my men "creeping" out and in. When I found that I must either lose my good neighbour's friendship, or allow his pigs to have part of my property, I adopted the following plan. One day we met, I said, "You are just the gentleman whom I wished to see. You and I are very good friends and neighbours, and also our families; and I should be truly sorry to be the first to give any offence." He answered, "If it did not begin on my side it should not on his." I then informed him that I had sown some seed of Oaks and Hazel, but found the mice so troublesome, that I had put down some Beans and Peas, which had been steeped in arsenic, and if your pigs should come and eat the poisoned material it will be no fault of mine. My friend gave me a look, but made no reply. From that time I have never seen a pig enter the nursery. If your correspondent, who is troubled with rabbits, was to crop some ground near the fence where they come through, with Potatoes, or have a strip in fallow, and in different parts of the fallow have squares of choice Turnips, &c., that would be guarded with hurdles or nets; and if a tenant has a fancy to put down a little arsenic on a dewy evening on the ground in order to kill slugs or insects, and rabbits come and eat up the food where the fence was taken away, who could help it? One thing is certain, the rabbits would never come again.—*J.*

Durability of Oak.—I beg to state that the date 1035, mentioned by me in a former article on this subject, I have since found, upon close inspection, to be wrong. The

upper part of the 6 is evidently worn off, as that part of the beam, being much exposed to the weather, is decayed, and there can be no doubt but that the date is 1635. From the Philosophical Transactions, Vol. x., Part iii., and p. 1254, it appears that the Indian or Arabic characters were introduced into Europe about the year 1352. In the same vol. are copies of Arabic numerals that were taken from beams; one from Ashford, in Kent, is dated 1295; another from Cambridge is dated 1332; but these are very rude specimens, with the figure 5 inverted thus ς. From this it is clear that these numerals did not get into general use until about the 16th century. The durability of Oak-timber, when felled in winter with the bark on, is, however, fully established, as the Oak-beams of both dates had sound bark on them, and, consequently, the timber was also sound.—*W. Billington.*

Thunbergias.—These pretty climbing plants are generally cultivated in a stove. They will, however, grow and flower freely in a greenhouse; or even when they are planted out in the open border, during the summer months, if the situation is sheltered, and exposed to the influence of the sun, they will flower well. In propagating those that are intended for planting out, take off the lateral shoots when they are of a sufficient length (which, if possible, should be done in March, so that the plants may have attained a medium size before they are put out), pot them in equal quantities of peat and sand, then plunge them in a hotbed, and they will strike root in a week or two. When they are rooted pot them off into small pots filled with good rich loam and leaf-mould, mixed with a little sand; then replace them in the pit, or frame, until the middle of May, when, if the weather is favourable, they may then be planted out. If the soil is not naturally good it should be made so; and as the plants advance in growth, they should be trained to some kind of support, which may be of any shape that fancy may suggest. If the season is dry, they should be watered and syringed. About the middle of October take up the plants, with good balls, repot them, and place them in the greenhouse. After they have been there for a short time, they may be removed to the stove, where they will keep gay for the greater part of the winter. T. alata has a beautiful effect when it is planted out on a rockwork, where the plant appears in its natural character, clinging to the various projections, which it quickly covers.—*J. McI., Hillsborough.*

Suggestions in Manuring.—Taking a lively interest in the subjects discussed in the *Gardeners' Chronicle and Agricultural Gazette*, and in the very various inquiries now in progress as to the food of plants, it has occurred to me whether sugar might not be usefully applied in certain cases—

The analysis of sugar I believe to be—of carbon .	42·85
Oxgen and hydrogen	57·15
	100 parts.

Consequently, it is wholly composed of most essential elements in the growth of plants. Might it not be well deserving of experiment whether its practical effects as a manure might not be powerful?—No doubt it would be expensive; but it might be efficacious in very small quantity, and although it might not be applicable to Agriculture generally—it might be reasonably applied to certain purposes in Horticulture. Can any one say what effect might be produced in the culture of the Grape or Garden Red Beet, both of which contain so large a quantity of saccharine matter? Possibly it might produce a powerful effect on the Onion. The constituent parts of sugar justify the idea that it might produce powerful effects on vegetation: experiment can alone determine, and such experiments can be so easily made, that I should presume to say they were deserving of being made. It might be applied judiciously either in the raw state, like other concentrated substances, or in solution. Possibly it might be worth while, in addition to the Vine, to make such trials with reference to the Peach, the Nectarine, and the Fig—on the principle that the produce of plants partakes more or less of the nutriment they receive. Considering the quantity of silica contained in the bark of the Vine, might not an experiment as to the effect of silicate of potass be deserving of being made? I admit that these proposals are somewhat empirical, but they seem also to have something like chemical principle for their foundation.—*Amateur, Dublin.* [We have ourselves tried the effect of solutions of sugar on plants, but the result was not such as to induce us to repeat the experiment. Others, however, may be more fortunate. Perhaps by mixing it with small quantities of animal manure, sugar might be made to act.]

Miscellaneous.—Sylvanus is desirous of obtaining information as to the price of Oak-bark, foreign and English, in the Bristol, Liverpool, and London markets. He observes that an extensive combination exists amongst the tanners to keep down the price of bark, and promises to write to us on the subject, if we do not take it up ourselves. We believe that a combination does exist amongst the tanners to keep down the price of bark; but we have really no time to devote to ferreting out these abuses satisfactorily, although it would give us pleasure to see the matter taken up by "Sylvanus," or any other party. ——A correspondent, signing himself *Drewen*, states that an effectual way of preventing Vines from bleeding after they are pruned is to mix equal quantities of quicklime and poor cheese in a mortar, with a little water, and work all together until they become quite incorporated. He then directs that a small quantity of this mixture should be rubbed very hard into the wound, leaving a small covering of the cement on it. This, he says, will stop a Vine from bleeding at any time of the year.——We have before us some communications on the quality of the *Thornfield Pines;* but we should be greatly obliged to *known* correspondents for further information before we publish it. It is a public question of some importance, and we are anxious for the opinions of the best men who have personal knowledge of the facts relating to the subject.

Structural Disease.—"Der Greif" begs to express his willing acquiescence in the courteous suggestion of the Editor of the *Gardeners' Chronicle*, and therefore refrains from any further effort at present controversially to establish his opinion of the essential dependance of functional upon structural disease, although he feels how much ought to be said under other circumstances concerning the distinction between "change of condition and change of structure." At the same time he begs to express his lively sense of the aptness and beauty of "M. D.'s" reasoning, derived from the presence of nerves and vessels of nutrition, and of function in many organs, although he could not feel the weight of his mechanical analogies. He humbly conceives that that reasoning gives new strength to his own opinion, which he would be, nevertheless, far from wishing to hold against any evidence that could approve itself to his judgment as true. But "Der Greif" may perhaps be allowed to remark that "M. D." cannot have clearly understood the nature of his objections to the mechanical analogies. His position (defined now, not for the sake of controversy, but for the cause of truth), is simply this:—The cogs and wheels of a mill form component parts of an engine which has certain work to do; they are framed out of fixed material, and undergo no interstitial change excepting that dependent upon the slow chemical change of decay, and they are fitted for the performance of their labours by this fixity of atomic constitution. The individual organs of an animal form component parts of its integral frame, and have each a certain office to perform, but they are kept in a fit state for its performance by constant interstitial change effected in the material of their organisation by the absorption of effete material, and by the deposit of new; whatever may be the source of their functions, the healthy nutrition of their subject material is the means provided for the continuance of those functions; and therefore the inference is perfectly philosophical, since there can be no instant of their healthy existence in which atomic changes are not effecting within their tissues, and since no cessation of those changes can take place without occasioning structural derangement in that material whose structural fitness for office requires continued change; that functional derangement is intimately connected with the presence of some abnormal, or the absence of some normal, change in the intimate constitution of the material tissue of organisation.

Societies.

BOTANICAL SOCIETY OF LONDON.

J. E. GRAY, Esq., F.R.S., President, in the chair. Various donations to the Library and Herbarium were announced, including some species of Algæ from Cape Raceife, Algoa Bay, from Mr. Bowerbank. Read—the conclusion of the Paper commenced at the last Meeting, being a "Synoptical View of the British Fruticose Rubi, arranged in Groups, with explanatory remarks by Edwin Lees, Esq., F.L.S., &c." The groups into which Mr. Lees unites the species have been reported in the *Gardeners' Chronicle*, and it is unnecessary to enter into further details respecting Mr. Lees' views on the groups, species, and varieties of British Rubi, as they are now before the Botanical world in the "London Catalogue of British Plants," just published by the Society. The Paper was accompanied by drawings and specimens: the latter are deposited in the Herbarium of the Society.

LINNÆAN SOCIETY.

April 2.—Robert Brown, Esq., in the chair. Dr. Donaldson and Mr. Joseph Exall were elected Fellows.—Mr. Hugh Low presented to the Society 140 species of Australian plants, collected by Mr. Drummond; also a collection of Proteaceous plants from the Swan River. Captain Jones, M.P., presented to the Society dried specimens of the Ulva calophylla from Armagh, and the Oscillatoria æruginosa from Glasslough.—Prof. Forbes exhibited a species of Tulip, from Mount Ida, found by Capt. Graves and Lieut. Spratt. The perianth was white, but it is undoubtedly the Tulipa tricolor, of Ledebour and others.—Mr. Osborne presented cones of the Pinus Ayacahuite, P. öocarpa, P. filifolia, P. pungens, and a capsule of Spathodea campanulata.—The Duke of Northumberland presented a monstrous specimen of growth in the branches of the common Holly.—A continuation of Mr. Newport's paper on the Myriapoda chilopoda was read. This paper consisted of an elaborate examination of the structure of the Myriapoda, in relation to the other groups of articulate animals. The structure of the segments, their development in the ovum, the position and character of the nervous system, were minutely detailed. The number of the segments entering into the composition of the head of the articulata had been variously stated as two, twelve, five, three, and seven. The author concluded that in the Myriapoda they were eight. The foot-jaws of the Myriapoda he demonstrated to be the analogies of the mandibles of insects.

ENTOMOLOGICAL SOCIETY.

April 1.—Geo. Newport, Esq., in the chair. Dr. Harris, of America, Signor Costa, of Naples, Charles Lucien Buonaparte, Prince of Canino, were elected corresponding members.—Specimens of the bark of the Elm-tree were exhibited by Mr. Samuel Stephens, which had been attacked by the Hylesinus varius. These markings were smaller, but closely resembled those of the Scolytus destructor.—Mr. Westwood exhibited a box of Goliath beetles from the New World, from Mexico; these were unique, and the first American specimens seen in this country.—Cases of insects were exhibited from Mr. Eisdale Downes, of Bombay, accompanied with notes; they consisted of the larvæ of a small species of beetle, named Cassida, and several cocoons and perfect insects of a new species of moth. The cocoons were attacked by a species of the family of Ichneumons. The notes referred also to the habits of a species of Cercopis, which is called the Cow-ant. The author supposed that the ants, in surrounding this insect, attempted to destroy it; but the fact is, that the Cercopis secretes from its skin a saccharine matter, of which the ants are fond of partaking; and this is why it has the name of Cow-ant. It has also, in addition, a pair of abdominal appendages, which look very like horns.—A continuation of Mr. Saunders's paper on the Chrysomelidæ, consisting of descriptions of the genus Prionopleura, was read.—A communication was read from Captain Boys, of India, accompanied with drawings of a species of Pausus, and of a small beetle belonging to the genus Anthænus, which had been found living upon horse-hair gloves.—The secretary read a paper, which he had received through Mr. Horton Loyd, from Dr. Holme, on the discovery of the Cossomuss linearus, a small beetle, in black carbonaceous matter taken from a cavity in a barrow, near Manchester. These insects were generally found between the bark and the wood of the Oak-tree; remains of Oak-wood were found in the cavity. This paper gave rise to some discussion.—Mr. Westwood thought the age of the barrow must be at least 1600 years; he had seen specimens of insects found in a vase in a tomb at Rome, and also some from a box in a tomb from Egypt. He thought these insects might have been intentionally buried with the body amongst whose remains they were found.—Mr. Spence thought they must have been introduced by means of the Oak-wood which was contained in the barrow; and Mr. Waterhouse accounted for the presence of insects in tombs, by supposing that they were introduced unintentionally with the articles in which they were found.

MICROSCOPICAL SOCIETY.

March 20.—J. S. BOWERBANK, Esq., in the chair. Messrs. Avery, Thomas Callaway, jun., Aikin and Orvil, were elected Fellows of the Society.—A paper was read by Edwin Quekett, Esq., on the Structure of the Ligament of the Valves of Conchiferous Mollusca. The author commenced by stating that the ligament which united the two valves of the shell-fish known by the name of Bivalves, was composed of elastic tissue, and that the property of elasticity remained after the death of the animal. The position of these ligaments is of two kinds; they are placed either on the inside or on the outside of the shells which they unite together. During life the contraction of the adductor muscle keeps the valves together, and when this is relaxed the shell opens by means of the ligament. In cases where the ligament is placed in the inside of the shell, its elasticity would produce the opening of the valves, but where the ligament is placed at the back of the valves it is necessary to suppose that it possesses a contractile as well as an elastic power. On examining by the microscope the texture of the ligaments, it was found that those existing in the inside of the shell presented a simple homogeneous structure, whilst those attached to the outside exhibited a fibrous structure. The fibres were of a uniform size, and transparent, and presented a close analogy with the structure of muscular tissue. This structure was remarkable, as neither blood-vessels nor nerves could be found in it, and yet it presented the power of contractility.—A discussion followed in which Dr. Lankester stated that he thought Mr. Quekett had not fully demonstrated the contractile function of the posterior ligament. If it were contractile it was an important fact, as this tissue was independent of the nervous system.—The Chairman stated his conviction that nerves might pass through the substance of the shell, and influence the function of the tissue. It was well known that vessels existed in the substance of the shell, as he had demonstrated.

Reviews.

Irby and Mangles' Travels in the Holy Land. 12mo. Murray.

A CHEAP edition of this most interesting book, which is quite indispensable to those who would study the Scriptures critically, is indeed most welcome, and Mr. Murray has our thanks for introducing it into his Colonial and Home Library. It is only a week or two since (p. 199) the question of the Mustard-tree of Scripture was discussed in our pages, and we are now able to give, *verbatim*, the travellers' account of this tree:—

"There was one curious tree which we observed in great numbers, and which bore a fruit in bunches, resembling in appearance the Currant, with the colour of the Plum; it has a pleasant though strong aromatic taste, resembling mustard, and, if taken in any quantity, produces a similar irritability in the nose and eyes. The leaves of this tree have the same pungent flavour as the fruit, though not so strong. We think it probable that this is the tree our Saviour alluded to in the parable of the Mustard-seed, and not the Mustard-plant, which is to be found in the north; for although in our journey from Bysan to Adjeloun we met with the Mustard-plant growing wild, as high as our horses' heads, still, being an annual, it did not deserve the appellation of a tree; whereas the other is really such, and birds might easily, and actually do, take shelter under its shadow."

We may add, that the volume is full of important information concerning the Natural History of the Holy Land.

THE second part of *The Botany of H.M.S. Sulphur* (see p. 70) is before us. It is wholly occupied with Californian plants. Among the more remarkable species are a new Fraxinus (latifolia) from San Francisco, a Martynia (althæifolia) from the Bay of Magdalena, and some Eriogonums. The plates consist of new genera and species described in the text. We are still without any intimation of Mr. Barclay's Californian plants having been sent from the British Museum for examination, which, considering that this work is supported by Government funds, is, to say the least of it, a circumstance that requires explanation. The public has a right to inquire how it happens that an official account of "The Botany of the Voyage of H.M.S. Sulphur" is published, without the slightest assistance from the materials of the

botanist who was paid by government for collecting them, although those materials are actually in the country. We trust that Mr. Hinds, to whose unpaid zeal the work owes its existence, will not be restrained by any false delicacy from enlightening the public upon this strange fact.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Gladiolus Gandavensis. The Ghent Corn-flag. (*Half-hardy* [illegible] Triandria Monogynia.—Few cultivators [illegible] of the great capabilities of the genus Gladiolus [illegible] purposes, and hence we commonly see the [illegible] in comparatively small pots, with a poor [illegible] the size and beauty which they would [illegible] to better treatment. It is as border-[illegible] they prove so peculiarly showy; whether [illegible] be in the open air, sheltered from behind, and having [illegible] aspect, or whether it be in a pit or frame, or low conservatory. When planted out in a free soil, they appear to take a new character, and become objects of the most beautiful description. G. Gandavensis, which has probably received its name from having come from Ghent to this country, is an exceedingly good addition to the genus. It is evidently of hybrid extraction, and G. communis is most likely one of its parents. To that species, indeed, it bears much resemblance; but has more of the open flowers of G. psittacinus, with a slight inclination of its [illegible]. Whatever may have been its origin, it is certainly a [illegible] plant, and flowers in great abundance. To grow this and other Gladioli favourably, they should be planted in a [illegible] soil, and too much pulverised, and effectively drained. If kept in a pot, that pot ought to be a pretty large one, for they will not thrive luxuriantly when much confined at the roots. The fittest situation for them is a prepared border in a pit, or in front of a plant-house. Wherever they are put, however, the corms should be taken up yearly, after the leaves have decayed, and replanted about the month of November. Propagation is carried on by separating the young corms, at the time of removing them from the ground; but it is desirable to put two or three of the old ones together in a tuft when a fine specimen is wanted. —*Paxton's Magazine of Botany.*

Campanula fragilis; var. Hirsuta. Hairy fragile Bell-flower. (*Herbaceous perennial.*) Campanulaceæ. Pentandria Monogynia.—Of the many lovely plants belonging to the genus Campanula, we hardly know one which excels the present variety in beauty. And yet, somehow, it is not an object in which cultivators [illegible] much interest, or which they grow to [illegible] reasonable perfection. The specimen now noticed was [illegible] in the summer of 1840, at Messrs. Henderson's, [illegible], where most plants deserving of attention are [illegible], with a care which is truly delightful. It had by some [illegible] of C. carolina, an appellation the origin of which we cannot trace. In a greenhouse, however, the plant was [illegible] a pot about eight inches in diameter with its charming [illegible], which were also profusely borne on some branches [illegible] over the sides of the pot. In its habit the plant is very dense and compact, bearing a considerable number of [illegible] and large flowers, which are more expanded and [illegible] than those of most Campanulas. It is one of the neatest [illegible] greenhouse treatments, and from the soft blue of its pleasing [illegible] and the bright green of its foliage, attracts most persons' [illegible]. Nothing can be done in the way of developing this [illegible]'s good properties, or cultivating it advantageously, [illegible] it be put in well-drained and porous earth. De Candolle [illegible], that it is seldom met with farther north than 41° of latitude; that it occupies the evergreen region of Italy, and even extends itself into the lower woodland region, as far almost as the upper limits of the Beech, or to 3000 feet above the level of the sea. It hangs over the face of limestone rocks. To adapt its treatment to the peculiarities of its native situation, it ought to be grown in a very sunny part of the greenhouse, where it puts little moisture except while growing. The soil should be a very open loam, with a little leaf-mould, neither of which must be at all sifted. A little limestone mixed with it, or some pieces of broken [illegible] will be useful, as it is essential that the soil be kept [illegible] drained. In the winter it needs hardly any water and a particularly dry position. An upper shelf in a greenhouse is the most [illegible] place for it at all times, save when it is flowering. It may be increased by cuttings of the fresh shoots taken off in spring, and placed in a trifling bottom-heat.—*Paxton's Magazine of Botany.*

GARDEN MEMORANDA.

Messrs. Chandler's Nursery, Vauxhall.—Most of the Camellias in the very extensive collection of them at this place are now in full bloom. The multitude of large dazzling blossoms of various colours which meet the eye on entering the house has a very imposing appearance. Among the newer or better varieties the following are well worthy of notice, and are deserving of a place in every collection. Hendersonii, a well-formed pink flower, is very double and one of the best. Eximia has large crimson blossoms, which are well shaped; the plant is an erect grower and requires more heat to set its flower-buds than most other kinds. Henri Favre, a large rosy pink, is very double, and is one of the very best. Queen Victoria or Reevesii is a good red, having a stripe of white up the centre of each petal. In the same collection was Adonis, a Carnation variety, which having a fine habit, and being a profuse bloomer, is one of the best of its class. Perfection, a small compact crimson flower, is very round, and comes occasionally striped with white. Pessleyi rosea, is a pretty Carnation variety. Alba rosea, a compact double flower, is white, and delicately shaded with yellow. Candidissima very much resembles the old double white. Imbricata alba, a fine showy variety with a good habit, has beautiful white blossoms beautifully striped with pink. Among others the old Myrtifolia was conspicuous for its pretty fragrant pink flowers; and Fimbriata also, an old variety, was producing its beautiful white-fringed flowers in abundance. Nitida is rather new; it has well-formed pink blossoms, each petal being finely striped with white. The plant has a habit which resembles Carswelliana in every respect except in the foliage. On a plant of Reticulata were some large showy blossoms, which are not unlike a fine large Paeonia bloom. Fordii is a good new double pink. Rosea has dark pink flowers, which are beautiful when [illegible] blown, on account of their fine cup-like shape. Sweetii is a variety of late introduction, has well-formed petals, and very round petals. Elegans has large bold flowers, which are beautifully mottled with white. Alba is a rose-shaped crimson; and Lady Hume's Blush, which is an old variety, is worthy of a place, even in a small collection. The Camellia is a plant of easy cultivation, the most important point, after it has made its growth and the flower-buds are set, is to get the young wood well ripened. For this purpose the plants should be placed out of doors, about the end of June, in a partially shaded situation, where for six or eight weeks they may thus be exposed to increased light and a free current of air. By this treatment the plants store up a good supply of highly-elaborated sap, which materially assists their blooming the following season. In a span-roofed house, near the show-house, a plant of Wistaria sinensis, about 45 feet long, is trained along the angle at the top, immediately above the passage, where its newly-opened and delicately-perfumed pendent blossoms have a fine effect. Here also, among other plants, Dillwynia glycinifolia was producing its pretty small unassuming blossoms in abundance. The show-house was gay with Rhododendrons, Acacias, Azaleas, &c. Among the latter was a fine specimen of A. Smithii coccinea, which was covered with its showy red flowers.

Messrs. Rollisson's Nursery, Tooting.—At this place is a most beautiful plant of Dendrobium fimbriatum, which for magnitude of branches and profuseness of bloom I imagine is scarcely equalled. This plant, on entering the Orchidaceous house, presents a very grand and imposing sight. It is one mass of bloom, and covers a space of about 20 square feet with its gracefully pendent branches, which are five or six feet in length. It is about 12 years old, and is growing in peat, which is freely mixed with crocks. The house is kept at a temperature of about 60° at night, which might be quoted as a maximum in which this beautiful tribe of plants has been most successfully cultivated at this Nursery, where they grow as in their native habitats. Another very attractive plant is the Phalænopsis amabilis, which is covered with delicately white showy blossoms. This, like the rest of the plants which the house contains, bears evidence of the good treatment which they receive. The late Mr. Rollisson was renowned for his cultivation of Heaths, and his sons bid fair to merit the same reputation. This beautiful tribe promises to bloom very freely this season. They are grown in the Wimbledon peat mixed with silver sand; they are at present in the Heathhouse, where they are supplied daily with abundance of air and water, the principal care being in potting to give them a soil which will admit of free and rapid drainage.—*G. M.*

Miscellaneous.

Van Diemen's Land.—We learn from the *Launceston Examiner* that the Horticultural Society of Hobarton have been making arrangements with the Governor for possession of the Government Gardens there. It appears that considerable progress has been made in laying out buildings and works, and that Mr. W. Duncan has been appointed Superintendent at a salary of 75*l.*, with a house, &c. A recent meeting of the Society had been well attended, and had resulted in the addition of Sir Eardley Wilmot and 28 new subscribers. It was hoped that the Society would receive some assistance from the Colonial Government in aid of their funds, which are low.

The Scotch Fir.—We extract the following from a report by Dr. Dickie on the forest trees of Aberdeenshire, published in the "Quarterly Journal of Agriculture," for March, 1843:—"Its distribution through Aberdeenshire is very general, occurring near the sea level, and reaching an elevation of 2000 to 2300 feet. It is for the most part planted in the low grounds, where it never attains any great size; and it is only in the forests of Mar and Balachbuie where we meet with it in a state of nature, and frequently attaining large dimensions. The abundant remains of this species found in peat mosses, in different parts of the country, show that there must have existed extensive forests where no trees now grow. In the reports which were received, no distinction is made between the two varieties of this species, which are admitted by some botanists: and so far as my own observation entitles me to express my opinion, I believe that the redder colour of the wood in Mr. Don's variety Montana, is merely accidental, owing to difference of soil and climate; for examples occur in the lower grounds, of trees of this species yielding a pale wood, which is stated to be equally dense and valuable with that of the former."—"The following may be considered the average annual increase at different periods:—From six trees at Kinmundy and Wardhouse, 40 years old, 3.4 and 4.8 lines respectively, giving a mean of 4.1 lines;* five trees at Breda and Huntly Lodge, 70 years old, 4.1 and 4.5 respectively, giving a mean of 4.3 lines; three trees, 90 years old, at Strichen, give a mean of 3.9 lines; nine trees at Pitfour, Echt, and Wardhouse, 100 years old, afford respectively 2.4, 3.2, and 2.7 lines, the mean being 2.76 lines; two trees in the forest of Balachbuie, 120 years, give a mean of 2.9 lines. These results have reference to the diameter at the thickest part. On the supposition that the correct ages of the trees were stated, it would seem that the growth continues steady up to 70 years, diminishing from that period to 90; the examples at Balachbuie are no doubt very favourable, and hence the increase shown by them can scarcely be considered as generally happening. It must also be kept in view, that the trees measured were the largest at each place, and that the results would differ materially were the calculations made from a number of trees showing the extremes (highest and lowest) at the same age in the same place."—"In Invercauld forest, the age was reported from 180 to 300 years, and girths of 10 trees were given, the smallest being 8 ft. 9 ins. at the soil, and 7 ft. in girth at 4 ft. The mean annual increase calculated from these ten trees, and assuming them to be 180 years old, would be 3.3 lines. There can be little doubt that the largest of these far exceeds 300 years, as from 100 to 120 years, the annual zones in the sections above recorded were so small that it was very difficult to trace them. The forester at Invercauld states, that 'the second tree of natural Fir in Table I. at 25 feet from the soil, measures 7 feet 3 inches girth, the solid timber in it being 160 feet. Another measuring at the soil 9 feet 6 inches, at 4 feet, 8 feet 2 inches, and at 27 feet, 6 feet 9 inches, contains of solid timber 150 feet. Another at the surface of the soil is 8 feet 9 inches; at 4 feet, 7 feet; at 16 feet, it is 6 feet 2 inches, with a clean trunk to the height of from 40 to 50 feet, and shooting up to the entire height of 70 to 80 feet. This small tree is only a specimen of hundreds of trees of the same size around it.' Mr. Cumming of Allanaquoich, to whom I am indebted, for measurements of 28 of the largest trees in Mar forest says, 'Most of them are supposed to be from 200 to 300 years old; some of them probably more. The cleanest and straightest grown trees are generally found on the north sides of the hills; the most branched, and, when cut up, the most knotty, on the south side. The south side of the tree is also, for the most part, the most branched, and the north side least. It is also to be remarked, that wherever tall clean trees are to be found, it is either when they still stand comparatively close to each other, or when the ground bears evident marks of their having done so at some period. Generally speaking, in very old trees, those having fine smooth bark are the most likely to be rotten in the heart; but the quality of such portions as are not affected with rot, is finer than that with rough bark.' In the 7th volume of the Transactions of the Highland Society, it is stated, that three trees from Mar forest, one of which had been felled for three years, another one year, and the third eight months, were tested at Woolwich. Each of these three trees was about 28 inches in diameter at the root, and contained 50 feet in length of serviceable timber, the grain remarkably clean, free from knots and full of turpentine; and from the results it appeared that their strength exceeded that of any other Fir submitted to experiment, although a specimen of Riga was selected from a tree supposed to be of superior quality, on purpose to form a comparison. The forest of Mar, from which these were brought, is the property of the Earl of Fife, contains upwards of 60,000 trees of the above description (the results of these trials were published in 1817), besides an immense number of less dimensions, fit for various purposes. Mr. Mortimer, wood-merchant here, informs me that the best planted trees of this species occur at Aboyne; they range from 80 to 100 years of age; many of them contain from 30 to 40 cubic feet; and of those on the Newhill, at the same place, several have from 40 to 80."

* A line is 1-12th of an inch.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

Now that the plants are getting hold of the fresh soil, more air may be allowed them; but shut up early in the afternoon, and when the watering is finished, give them a good syringing over head. Be sparing of fire-heat after this time, even although the thermometer is down to 55° in the morning. The fine weather we have lately experienced—hot dry days, mild dewy nights, and cool mornings—might teach us how to regulate the temperature for our house plants. The last portion of the Gesneras and Achimenes should now be potted, as they can hardly be safe any longer in their dry state; but to have them late in September and October, they must be kept back till about the end of May in a cold pit, allowing them no more water than will keep the soil from being quite dry. There is more merit in retarding plants properly than there is in forcing them into early bloom.

Conservatory.—If you have plenty of room, and abundance of plants to keep up a full bloom all over this house, you may dispense with shades or screens for a few weeks yet, and your plants will reap the benefit, but this is at the expense of their bloom. Where the supply of plants is limited, you must make the best of their bloom by slightly shading them on fine days, although it is against young growths. See that you have cuttings of Pelargonium echinatum, multiflorum, and Jewess, put in now for flowering next November: Jewess is better than Admiral Napier for the middle of winter. As there will be no want of flowers from this time until September for this house, you will have more time to think of and prepare your winter stock. Among Roses, Fulgorie is the best of all the late ones for flowering in November and December; it continues in bloom until the forced ones come in. Now is the time to get a reserve stock of young Heliotropes for forcing next winter; it is also a good time to put in cuttings of Picotees for forcing after Christmas. In short, if you wish to have a good stock of these things, you must prepare always six months in advance.

Greenhouse.—Every plant that is intended for a specimen should have the best situation in this house, and should be turned round two or three times a week: the shoots should be stopped from time to time, and it should have freedom on all sides. Epacrises and spring-flowering Heaths will bear close pruning after they are done flowering. Correas that have been flowering during winter should now be rather close pruned, and kept in doors all summer, where they will take the place of Fuchsias after September. Luculias that have been at rest since flowering are now beginning to grow again, and should be kept in a low moist atmosphere till all the eyes break forth. Forcing the Luculia at this stage, or even encouraging it to make an early growth, was the principal cause of failure on its first introduction.

Forcing-pits.—In many places these pits are now as full as at any former period. The overstock of duplicates and condemned specimens, parcelled out at potting time, are put in here to see what flowers or cuttings they might produce before they are finally thrown away; but a better practice is to turn them out in the border to take their chance. Hedychiums to flower late in the summer may now be started, and another crop of Tuberoses put in for succession. Primula sinensis for flowering from September should now be little stocky plants fit to be planted out in cold close frames by the middle of May, and more seeds of it should now be sown. Gesnera zebrina and longifolia, both tall flowers, should now be pushed on by all the heat and moisture at command. Now is a good time to divide the stools of Chrysanthemums, and cuttings should be put in of those that are scarce.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

The necessity of strict attention to the watering of newly-planted trees and shrubs cannot be too much insisted upon, and the watering should not be a mere wetting of the surface of the soil, but a thorough drenching to the depth of a foot or 18 inches. Large Evergreens, moved early last autumn with every possible care, now indicate that they will be no ornament throughout the season; while others moved since January are fresh and healthy,

which rather militates against the prevailing notion that autumn is the best time for moving Evergreens. Where the leaves are become brown it will be best to reduce the head of the plants, so as to make them break again from the old wood. Proceed with the hoeing and raking of borders, and throw in a little Mignonette, or Sweet Alyssum seed in all bare places. The time of a few women or boys will not be uselessly spent in eradicating Plantain and other broad-leaved weeds from the lawn. Let them put a little salt in the holes after the plants are cut out. Attend to mowing and sweeping, and keep every part of the garden clean and neat. In mowing the American garden mulch the beds with short grass, which not only prevents the parching up of the soil, but is also, when decayed, an excellent manure for the plants. I rather suspect this is the Macintosh of a "Moorland Gardener," —at any rate it is exceedingly useful, both in the flower and kitchen-garden, in dry weather.

Rosery.—My Chinese and Tea-scented Roses which were covered up with leaves and branches in the autumn are all living, most of them in excellent condition and breaking away strong and healthy. We shall now regulate them, pegging them regularly over the surface of the beds, and then cover them again thinly with evergreen branches until all danger of frost is over.

Reserve Garden.—Get in the biennial seeds as soon as possible, sowing them in drills 9 inches or a foot apart, and covering with rich compost. Stocks, &c., in the seed-beds are now becoming crowded; therefore, take advantage of the first shower to transplant them.

Pits and Frames.—The most forward of Hydrangeas now in bloom must be hardened off preparatory to being bedded out, and stocks and other plants blooming in pots may now be removed to the flower-garden, taking care to have mats at hand to cover them in case of severe frost. Most of the plants for bedding out may now be removed to temporary pits, or placed in sheltered situations, and if the pots are wanted a number of the more hardy may be plunged in sand, or sand mixed with decayed tan. No time must be lost in propagating Chrysanthemums if not already done. Leonotis Leonurus is a fine plant for autumn blooming, either in pots or planted out; it should now be increased by cuttings. Can any one favour me with a few cuttings of Verbena sulphurea?—if so, send them to the office of this paper.—*W. P. A.*

III.—FLORISTS' FLOWERS.

The *Auricula.*—The frost on the morning of the 9th instant would most assuredly "set" the blooms exposed to its influence. Some varieties, such as Kenyon's Ringleader, open very slowly, and these, when caught by frost, seldom expand well after. That section of Auriculas termed Selfs, with body colours of purple of various shades, &c. &c., do not appear so susceptible; they are surpassingly beautiful, and merit general cultivation. Continue the directions previously given for their management, and do not let seedlings have too much sun. *Polyanthuses.*—Within the last few days we have seen some beautiful seedling varieties of most excellent properties, which, when brought into competition, will completely extinguish many of the older sorts. Good flowers with red grounds or body-colour are yet scarce, Bullock's Lancer being one of the best of them. Seedlings that have been raised in heat may now be gradually hardened. We would advise artificial impregnation of the flowers where cultivators have the inclination to carry out the means thus placed at their disposal, of improving their breed of Polyanthuses, but of this interesting operation more will be said next week. *Tulips.*—Some of the earlier kinds are putting up their buds. This is a critical period, for at this season heavy rain is often succeeded by a frost, which congeals the water retained by the leaves, and consequently the future bloom is surrounded by a mass of ice, to its certain detriment. Some Florists draw out the water with a syringe; others, on hands and knees, make the circuit of their beds, blowing it out with their mouths, heedless of their nose or eyes being filled by the experiment; at all events, the moisture must be got rid of, and though the operation is not very dignified, what will not the enthusiastic Florist do to ensure the well-being and safety of his favourite flowers? *Carnations*—Ought all to be in their blooming pots; every day deferred is throwing a chance away; yet we fear that many layers have yet to be planted, and, when coming from a distance, in many cases with but little soil to their roots, it certainly cannot be expected that they can successfully compete with those which have been established in the autumn. Amateurs, I trust, will see the propriety of getting in their stock for blooming when the layers are ready, at the latter end of the year. *Pinks*—Are on the move, and must be attended to; these, when planted in the spring, seldom face well.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—If the bottom-heat keeps of a proper degree, the principal things to be attended to for a few weeks to come are, to pay particular attention to the temperature of the pits, to the admission of fresh air to the plants at all favourable opportunities, and frequently to examine the plants to see if they require water. Shut up early in the afternoon, and refresh the plants not in bloom with a sprinkling of soft tepid water through a fine rose. If the thermometer ranges from 57° to 60° where the young stock is growing, it will be sufficient. Much air in warm weather will be necessary for these, to induce a stout and compact habit of growth.

Vineries.—During the ripening of the Grapes in the early house, the red spider, if not checked, will increase rapidly. Wash the pipes or flues with whitewash into which sulphur has been stirred; and in clear weather shut up early, that less fire-heat may be required. Do not relax in maintaining a gentle heat in the outside borders, by adding some fresh litter. Be assiduous in your attention to the Vines in the succession houses. The late houses require much air and frequent syringings this warm weather.

Peach-house.—Where there are large and long-established trees in the Peach-house, the moisture is rapidly absorbed in such weather as we now have, and attention to giving thorough waterings is essential to the welfare of the present crop, and the formation of wood for another year. For watering and syringing use soft water, of a temperature from 65° or 70°. After the stoning process is over, the fruit, if too thick, should be thinned.

Cherry-house.—During the ripening of the fruit, when the quantity of moisture, both at the root and in the atmosphere, is diminished, insects will increase rapidly. Take means to eradicate them immediately after the crop is gathered, and supply the trees with water sufficient for their health.

Strawberries.—Endeavour to keep these free from insects, by fumigating and syringing, till the fruit begins to ripen, as these means cannot afterwards be put in practice without injury to the flavour of the fruit. The plants that have done fruiting may be planted out, to furnish early runners for potting—choosing a warm situation, where the soil is somewhat strong and rich.

Melons.—Attend particularly to the advancing shoots, and keep them at such a distance apart as will allow the leaves to expand without shading each other. The laterals must be cut away to a few of the best situated for bearers. Continue to add soil to the hills or ridges as the roots advance. The Melon-plants put out early, may now have the whole of the soil put into the pit or frame, pressing it firmly down if it is dry. Sow some seed for successional crops.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Newly Planted Trees will require to be well watered in this dry weather, and afterwards mulched, using in general cases, dry litter in preference to short manure, as the latter will be apt to make the tree grow too rampant. The season has as yet been very favourable for Apricots and Peaches, setting their fruit. Both will now need partial disbudding, removing only a few shoots at a time, that the flow of the sap may not be checked. Pick out the points of strong shoots, which will ensure healthy bearing wood. I make a point of saving carefully every twig of a Peach tree I remove at this season, as I find a decoction of them after being bruised, better for cleaning the trees of green-fly, &c., than any application of snuff dusting, tobacco smoking, or mud daubing.

Beans and Peas.—After sowing, soak the drills with water before covering the seed. After filling up the drills, spread dry earth over the rows, which will prevent the moisture evaporating. Sow *Savoys* for autumn and early winter use; *Lettuces*, of sorts for succession; *Granges' Cauliflower Broccoli*, to succeed the autumn Cauliflower; *Miller's Late White Broccoli*, to supply the table before the earliest Cauliflower comes in in May. This last variety, from its great usefulness, and dwarf compact growth, deserves a place in every garden. *Mushrooms.*—Make beds for summer produce. Choose the coolest situation you can find; if underground so much the better. In answer to "J. P.," sweep off any spawn that runs on the surface of the bed with a broom, or the palm of the hand. This will be a matter of no difficulty if the beds are as hard and smooth on the surface as they ought to be. *Routine.*—Make fresh beds for Cucumbers—much fermenting material will not now be wanted; prick out Celery, sow for the last crop: pot Capsicums and Tomatoes, water Cauliflower, Broccoli, &c.; watch your chance of a shower for transplanting; lay out paths for walking on round the various quarters; hoe and rake borders, and get the main walks put in good order for the season.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—In this department there is nothing particular to recommend, but what has been said previously; until the felling of Oaks and other trees of which bark is required commences. Felling and peeling should be commenced as soon as the sap flows freely, which circumstance should be carefully attended to, as it is the best season for such work.

Coppice.—The cutting of all poles, rods, &c., should be completed as soon as convenient before the peeling of Oak-poles commences; take great care to have the fences in good repair so as to keep out sheep and cattle.

Young Plantations.—The thinning of young plantations it is presumed is now nearly completed for this season, except where young Larches are felled for the bark, the felling and peeling of which should be commenced as soon as the bark will separate freely. All newly-planted trees should be carefully attended to now, fastening them well at the roots to prevent them from blowing about.

Hedge-Rows.—The fastening of any newly-planted trees should be carefully attended to, as it tends much to their success.

Nursery Work.—Continue to sow Nuts, seeds, kernels, &c., and plant in rows all seedlings and other small plants as soon as possible. Be sure not to let the roots get dry during the operation; endeavour to preserve carefully the newly-sown seeds, Nuts, kernels, &c., from birds and mice.—*W. B.*

State of the Weather near London for the week ending April 11, 1844, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 15th, 1840, and 20th, 1843—therm. 70°; and the lowest on the 19th, 1838—therm. 26°.

Notices to Correspondents.

BEES.—*Wax* may see Wildman's Mahogany Hive at Milton's, No. 10, Great Marylebone-street, or at Neighbour and Son's, Oxford-street, London.—*W. S.*——*A Lady.*—Nutt's hive certainly does not prevent swarming, nor does any other hive made of any material of the like dimensions. The principal causes of Bees swarming are, an over-crowded population, and oftentimes poverty, with a prospect of Royal progeny succeeding the departure of the parent Queen. Bees are known to have been kept in a colony of boxes for 12 years without swarming; but there is nothing mysterious in that. A prolific Queen, and a good situation, with almost any sized hive, is favourable to swarming; but if sufficient space is given to the stock hive very early in spring, with suitable inducements to enter, and where the combs can be attached near the body of the Bees, it is a means of preventing swarming. All small flights should be returned to the parent stock unless in very favourable situations, or where it is desirable to increase the number of stocks.—*W. Savage, Swaffham.*

CALCEOLARIAS.—*A Reader.*—If you sow well-ripened seeds of these in pots or pans, filled with soil of a light nature, and press the seeds gently into the soil, without covering them with mould, they will vegetate quickly. They should be placed in a gentle hot-bed, and watered with a watering-pot having a very fine rose. We have seen trellises used on flued walls out of doors, opposite the furnaces, where the trees are liable to be injured by the heat; but never over the whole wall.‡—*Hospitis.*—As your terms are limited, and the price of flowers frequently depends upon the stock a seller has on hand, your best plan is to write to a respectable Florist, stating your terms, and get him to send you the best he can afford at the price.*

CAMELLIAS.—*Hospitis.*—If in vigorous health, let their roots alone for the present, and repot them next year, when they are about to grow again. Keep the plants in-doors during all the growing period, and when their wood is made, turn them out of doors in a sheltered sunny place during the summer. If you keep them too much in the shade, they will not form flower-buds abundantly.——*J. W.*—For grafting these, well-ripened young shoots should be taken, when they are just beginning to grow, and before the buds are far advanced. They should be worked upon healthy young stocks, which should afterwards be placed under hand-glasses in a stove or forcing-house, where a temperature of from 60° to 70° is kept up. Whip-grafting, without the tongue, is perhaps the best method; and it is advisable to retain a few leaves on the stock above the graft, in order to draw up the sap. The Single Red makes the best stock, as it strikes freely from cuttings. Orange-trees may be grafted in nearly the same way; but if a little bottom-heat can be given them, so much the better.‡

CURRANTS.—*Tyro.*—We should think that calico, properly prepared with Whitney's composition, and put over your Currant-bushes, would protect their blossoms, and help to ripen their fruit earlier.‡

FOUNTAINS.—*T. J. M. A.*—Upon further consideration we see that there is no describing the contrivances for jets, and we have no woodcuts ready. You had therefore better apply to some engineer for patterns, or consult the "Revue Horticole," last Number for 1844, which any French bookseller can procure for a trifle.

FUCHSIAS.—*Rhodon.*—A sandy pulverised turfy loam is the best for the first potting; where this can be obtained, one-sixth of the whole proportion of sand is enough; but in heavy loam, one-fourth is requisite. The above distinction in loam is a necessary one in cultivation generally. *W. W.*——*A Young Beginner.*—Send a fresh specimen of the Fuchsia.——*G.*—We believe the following:—Smith's Queen Victoria, Epps' Kentish Bride, Standish's Colossus, Bell's Decora, and Youell's Queen Victoria.*

HEATING.—*A Constant Subscriber, Macclesfield*—Certainly.

IRISH YEW.—*B. K. M. S.*—We believe it to be true that all the plants of the Irish Yew originated at Florence Court.‡

MANURE.—*Jeremiah.*—The fluid in your tank is of great value; but it should have some water added to it, say one third part, and then be well fermented. Afterwards, it may be employed as liquid manure, and will be found excellent. Before using it, try its strength by pouring a little over some young leaves: if it burns them, it is too strong, and must have water added to it. It is not the ammonia alone that gives this fluid its value; there are many other valuable constituents.——*Northumbriensis.*—We cannot say what is the *best* artificial manure for Apple-trees, &c. in a poor, worn-out, hungry soil. If you can get rotten dung, mix it with one sixth part of guano, either Peruvian or Potter's, or of superphosphate of lime, and dig it in. You will probably find it answer the purpose.

NAMES OF PLANTS.—*C. F. C.*—Flower quite crushed; apparently Lycaste aromatica.——*J. C. L.*—Catasetum semi-apertum.—*J. M.*—Hyoscyamus aureus.——*H. H.*—Rosa villosa, Trifolium minus. —— Γεωργος.—Erica andromedæflora, Epidendrum selligerum; Lycaste crushed and dried up. Is it different from L. cruenta?——*W. H. G.*—Very near Oncidium guttatum: perhaps a new variety of that species.——*C. J. P.*—The twigs of some tree stripped of bark. Why not of the Birch? ——*J. C. L.*—Very near Epidendrum graniticum; but may be different.——*J. S. P.*—1, Clianthus puniceus; 2, Gorteria rigens; 3, Linum flavum; 4, Rhododendron davuricum; 5, Andromeda calyculata.——*E. B.*—Asplenium Trichomanes.

ROCKWORK.—*An Inquirer.*—If Roman cement does not hold together the stones in your rockwork it is because of one or the other of two things: either the cement is bad, or it is badly applied. No better material *can* be had.

STRAWBERRIES.—*Amateur.* Thanks. It is probable that your Strawberries have too much water in proportion to the light and heat they are exposed to. If so, the remedy is obvious.

VINES.—*J. M.*—If a piece of bast is tied tightly round the stem of a Vine, its buds will burst better below the bast than would be the case under the same circumstances if the bast were away. The reason is, that a tight ligature presses upon the sap-vessels below the bark, and prevents the sap rising up to the end buds so quickly as it naturally does; the effect of which is, to force the sap into the lateral buds.

WATER.—*Rus.*—Without knowing what it is that makes your water hard, we can hardly advise you how to soften it. Why not try for yourself whether common soda will answer the purpose; and if not that, whether carbonate of ammonia, (common smelling salts), will not do? In either case, very small quantities must be used.——*J. S.*—To every 100 lbs. weight of water add 2½ lbs. of common salt, and it will be about as strong as sea water; but as sea water contains the muriate and sulphate of magnesia in notable quantity, they too are required to complete the resemblance; say ¼ lb. of each to the same quantity of water. Drench the Asparagus beds two or three times when the summer growth is about to be made, and is a little advanced.

MISCELLANEOUS.—*H. P.*—We cannot recommend nurserymen. ——*A Subscriber.*—You cannot keep Mosses from greening the stone of your house, because their seeds are always floating in the air, and wherever they find a place they like, there they grow. A solution of corrosive sublimate would perhaps clear the stonework, but it might become black by exposure to air, and it is very dangerous to apply. Your only remedy, as far as we know, is to paint the stonework, when perfectly dry—if it is ever so.——*N. G.*—Anti-corrosive paint is an excellent material for out-door work; but it is not suited for painting the rebates of movable sashes, because of its roughness.——*R. W.*—We have not seen guano tried on Rhododendrons. If to be used it must be well mixed with water. We do not recommend nitrate of soda. If guano is good, three or four applications in a year, in a fluid state, ought to be enough. Cowdung is capital manure for Rhododendrons.——*A. K. L.*—If you cannot get gas-water, try soot two parts and salt one part, thoroughly mixed a few days before using. What difficulty can there be in growing Violets? Keep them in a warm, well-drained place, and they require no more care.——*D. W.*—One of the Societies has a garden, the other not. You should consult the secretaries. We presume that the Botanical Society would be the more useful to a young botanist.——*E. C.*—The two species of Cornus are rather tender; the others are perfectly hardy. They are trees or shrubs, and are unfit for a very small garden. Raise them in a Cucumber bed, and expose them to the air by degrees, soon after they are up. They require the same management as Dogwoods, Hollies, Thorns, and such things. ——*J. M.*—The distinctions among Apples called Russets, Pippins, and Pearmains are vague, and have no definite meaning. Pippins are simply "seedlings;" Pearmains are oblong without angles; Russets speak for themselves.—— *Rural Chemistry.*—Is it *true* that vinegar and water will keep cut flowers from fading longer than common water? That is the *first* question. We doubt it.——*R. B.*—Prune Cedars of Lebanon after their young wood is made.‡——*R. B. M. J.*—Verbenas will grow in almost any kind of soil; some other thing than that must be the cause of failure. Possibly they are kept too wet and damp off.‡——*J. B.*—A full account of Saxifraga hypnoides is given at p. 285, Vol. 1843. We never recommend Nurserymen.‡ —— *Examiner, &c.*, may mix guano with water at the rate of 4lbs. of it to 12 gallons of water. After mixing, it should be allowed to stand for 24 hours before it is used.‡——*An Amateur* is thanked for the number sent.——*Amateur.*—The subject on which you write is one that we would advise you about personally with pleasure, but it is not suited for public communication.——*G. Mt.*—It is one of the privileges of the Fellows of the Horticultural Society. Upon what principle do you, who are not a Fellow, claim the privileges of those who pay for being so? Permit us to add that there is no blindness equal to that of meanness.—— *W. L. M.*—Very strong brine is perhaps the most effectual fluid cure for grass in gravel walks; but there is nothing like labour: it is the most effectual and cheapest in the long run. You may kill Blackbirds, &c. by means of rat-traps baited with their favourite food.——2s will be given for No. 45, 1843.

SEEDLING FLORISTS' FLOWERS.

CALCEOLARIAS.—*G. S.*—A large cream-coloured flower, with maroon blotch; a fine flower, but too much like many of Mr. Green's.*

CINERARIAS.—*W. M.*—The flowers of your Queen of May want compactness of form, and the termination of the petals is rather defective. It forms, however, a distinct variety, and will be valuable in a collection, from the novelty of its colour, which is a light blue, of a peculiar tint, with the disk of a darker blue. The flower is large, and it appears to be a free bloomer.*——*G. S.*—A pure white flower, with a purple disk; a bright and lively flower. A sprig should be sent, not single pips.*

FUCHSIAS.—*B. W.*—Your seedling is a fine large bold flower, with rather coarse sepals; and in general appearance it too much resembles many varieties in cultivation.*

ERRATUM.—In the list of Subscribers to Mr. LOUDON'S "Encyclopædia of Trees and Shrubs," inserted in this Paper, March 30, for Mr. G. Tackman, *read* Mr. G. Jackman.

*** As usual, many communications have been received too late.

RESIDENCE AND SPORTING.

WANTED, to Rent, either Furnished or Unfurnished, a moderate Residence, with 10 to 100 acres of Land, and the exclusive right of Sporting over a well-preserved Manor. It is not absolutely necessary that the Manor adjoin or belong to the Residence.—Full particulars to be addressed to Messrs. HERCAR, Surveyors and Land-agents, 10, New Bond-street, opposite the Clarendon.

The Agricultural Gazette.

SATURDAY, APRIL 13, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, April 17, Agricultural Society of England.
THURSDAY, April 18, Agricultural Imp. Soc. of Ireland.
WEDNESDAY, April 24, Agricultural Society of England.
THURSDAY, April 25, Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

April 25 Grove Ferry.
April 26 Debenham. Hadleigh. Wrentham.
April 27 Cardiff. Gloucester.

It is unnecessary to enter fully into detail on the subject of POTATO CULTURE, but there are two points to which we may usefully direct the attention of our readers: the diseases to which the plant is subject, and the manures suitable for it.

The Potato plant has of late years been subject to several diseases which, though many remedies have been suggested for them, still occasionally injure or destroy our harvests.

The Curl, so called from the crumpled appearance which the leaves assume under its influence appears to be owing to the over-ripening of the tubers to be used as seed. The experiments of Mr. Dickson, reported in the "Memoirs of the Caledonian Horticultural Society," show that, while sets from the waxy seed of the Potato produced healthy plants, those from the ripened seed did not vegetate at all, or produced curled plants. For further particulars on this subject see an article by Mr. Deans in this Paper.

The Rot, or *Taint*, which causes the entire destruction of the set, is also probably owing to a constitutional defect, arising from circumstances connected with the cultivation or treatment of the plant. It is believed by many that the liability of the Potato to this disease is owing to planting cut sets instead of whole ones; and the idea is corroborated by the fact, that means taken to produce upon the cut sets an artificial skin, have occasionally possessed a beneficial influence. Thus, in the September Number of the "Quarterly Journal of Agriculture" for 1841, there is a paper by Mr. R. White on what is stated to be "a simple means of preventing the failure of the Potato crop." It consisted in riddling over every basketful of newly cut sets a shovelful of hot lime, and then turning them over and over again till the lime was well taken up by the sets, when they were put into a heap three or four feet thick, and kept for two or three weeks. "The hot lime had the effect of stopping the flow of the juice, and of encrusting a strong skin upon the sets." The experience of several years is quoted in this article in favour of this plan. We should think that no good end was obtained by allowing the sets to lie in such a large quantity together; the skin would form with equal certainty on the cut surface without thus exposing them to risk of injury from heating.

The following remarks are extracted from the 15th Part of Mr. Stephens's "Book of the Farm:"—

"Were seed Potatoes securely pitted—not over-ripened before they were taken out of the ground—the sets cut from the crispest tubers and from the waxy end—the dung fermented by a turning of the dunghill in proper time—led out to the field, quickly spread, the sets as quickly dropped on it, and the drills quickly split, there would be little heard of the failure even in the driest season—at the same time the precaution of obtaining seed frequently from an elevated and late district compared to where the seed is to be planted, should not be neglected. I own it is difficult to prove the existence of constitutional weakness in any given tuber, as its existence is only implied by the fact of the failure; but the hypothesis explains many more facts than any other, than atmospheric influence—for example, producing the failure like epidemic diseases in animals, for such influences existed many years ago as well as now. The longer the cultivation of the tuber of the Potato, which is not seed, is persevered in, the more certainly may we expect to see its constitutional vigour weakened, in strict analogy to other plants propagated by similar means, such as the failure of many varieties of the Apple and Pear, and of the cider fruits of the 17th century. This very season, 1843, contradicts the hypothesis of drought and heat as the primary cause of failure, for it has hitherto (to June) been neither wet nor dry, while it strikingly exemplifies the theory of constitutional weakness, inasmuch as the fineness of 1842 had so much over-ripened the Potato, farmers still unaware of the cause of the failure permitting the Potatoes they have used for seed to become over-ripened—that the sets this spring 'did not vegetate at all,' even in the absence of heat and light, and in the presence of moist weather. Had the Potatoes been a little less over-ripened in 1842 the sets from them might have produced only curl this season, though it is not improbable that the same degree of over-ripening may cause entire failure now, that would only have caused curl years ago; and as over-ripening was excessive last year, owing to the very fine weather, so the failure is extensive in a corresponding degree in this, even in circumstances considered by most people preventive of its recurrence, namely in cold and moist weather. And observe the results of both 1842 and 1843 as confirmatory of the same principle, illustrated by diametrically opposite circumstances. The under-ripened seed of the bad season of 1841 produced the good crop of Potatoes of 1842, in spite of the great heat and drought existing at the time of its planting in 1842; while the over ripened seed of the good season of 1842 has produced extensive failure in spite of the coolness and moisture existing at the time of planting in 1843. How can heat, drought, or fermenting dung account for these results?"

The following are good varieties of the Potato for field-culture:—Prince of Wales' Early, Shaw's Early, Bread Fruit, London Purple, Pink Eye, Magpie, China Orange, Red Kidney, Lancashire Kidney, and the No-blow. And, as a Pig Potato, we know of no variety which unites quantity and quality of produce more profitably than what is known in Gloucestershire as the Irish White Apple.

We allude to the subject of manures in connexion with the Potato-crop, not because, in the experience of the farmer, any manure has been found peculiarly applicable to it that is not equally beneficial when applied to other green crops, but chiefly in answer to several questions that have been sent to us by correspondents. The best manure for the Potato is that made in the farmyard from the consumption of roots and cake, or corn, whether by horse, oxen, or sheep. It need not be so well made or fermented as that applied to the Turnip, for it is not in need of any extraordinary supply of nourishment till, when in an advanced stage of its growth, it commences the formation of the young tubers. With regard to the fertilisers of commerce, the only lengthened series of experiments that we know of is that made in the Horticultural Society's Garden by E. Solly, Esq. They were not on so extensive a scale as for their results to be looked upon by *farmers* with confidence so far as *quantity* of produce is concerned, but they are very interesting as far as they go; and we quote the following, being a compilation of some of them, extracted from Mr. Solfy's Report in the 3d vol. of the Horticultural Society's Transactions:—

	Quantity of manure per acre.	Proportional Nos. representing the produce p. acre of tubers.
Gas-liquor and phosph. acid	600 gallons	85
Gypsum	2 cwt. 96 lbs.	132
Nightsoil & bleaching powder	5 tons	117
Putrid urine	800 gallons	89
Gas-liquor and nitric acid	800 gallons	98
Sulphate of iron	1 cwt. 46 lbs.	125
Gas-liquor	800 gallons	98
Night-soil, bleaching powder, and sulphate of iron	5 tons	127
Gas-liquor and muriatic acid	800 gallons	135
Nitrate of soda	2 cwt. 96 lbs.	121
Do. do. and salt cake	2 cwt. 96 lbs.	147
Guano	16 cwt. 27 lbs.	163
Nitrate of soda	1 cwt. 48 lbs.	144
Nightsoil and sulphuric acid	5 tons	164
Putrid urine & sulphate of iron	800 gallons	165
Epsom salts	2 cwt. 96 lbs.	156
Gas-liquor and sulphuric acid	800 gallons	151
Bone-dust	76 bushels	186
Epsom salts	1 cwt. 48 lbs.	167
Rotten dung	5 tons	184
Salt cake	1 cwt. 48 lbs.	273
Nightsoil	5 tons	179
Daniell's Manure	20 bushels	185
Sal ammoniac	1 cwt. 48 lbs.	181
No manure		128
Salt cake	2 cwt. 96 lbs.	240

A correspondent from Bath will see that gas-water neutralised by phosphoric acid, being in fact a solution of the phosphate of ammonia, stands very low, as a fertiliser, in the scale of these manures, but "it must be borne in mind that these experiments were made on garden ground, the composition and nature of which is very variable and uncertain, and far too rich to enable positive deduction to be formed of the relative value of the different substances employed as manure." To this we may add that they were made on very small plots of ground, and coupling this with the known properties of some of the manures employed, we may, perhaps, consider this table as illustrative of Mr. Lawe's remarks in a leading article of last week, rather than of the relative value of the manures employed.

We may mention, in conclusion, that an account of very good Potato-culture is given in great detail by Mr. Morton, in his description of the mode of cultivation on Stinchcombe Farm, in the 1st vol. of the "English Agricultural Society's Journal." Mr. Dimmery, who occupied that farm, always grew Potatoes after Turnips which were consumed on the land by sheep; and in addition to the manuring which the land thus received, he used, with the greatest advantage, to apply about 25 bushels of soot per acre before planting the sets.

ON THE CULTIVATION OF FLAX.—No. II.

(*Continued from p.* 218.)

In the cultivation of Flax, the selection of the soil is a primary consideration. In this respect, it has been already remarked, it has a wider range than most of our cultivated plants. The soil preferred for this crop in the Low Countries, and other parts of the Continent, where its culture is so well understood, is what is generally denominated strong loamy land, such as is best adapted for the growth of Wheat. Adhesive clays and light sandy soils are equally unsuited for Flax, as also all soils containing any considerable portion of peat in their composition. On heavy clay soils, it is difficult—indeed, almost impossible—to attain that state of perfect pulverisation which is essential for the successful growth of Flax; and on the class of extreme light upland soils, the inferior quality of fibre produced sufficiently indicates that such are not the proper soils for that crop. In the case of reclaimed bogs, a great length of time must elapse, and the character of the soil be completely changed, before it is fitted for Flax-culture. Even when so far divested of its original character as to be well suited to the growth of Wheat, it will still produce Flax of a very inferior quality. In this respect, Flax differs from most of our other Agricultural plants, which usually succeed well on reclaimed bog, when the altitude is not great, and the soil otherwise of good quality.

The state of the land with regard to fertility, is also deserving of notice. The direct application of manure to the Flax-crop is found to be most injurious, producing fibre of so coarse a quality as to be almost worthless; yet a high degree of fertility in the soil by previous manuring, or otherwise, is indispensable. These remarks have reference to the manure of the farm-yard; the value of the portable manures, as they may be termed, not having yet been sufficiently ascertained to warrant an opinion being offered on the subject. So far as this crop is concerned, therefore, a wide field is open for experiment; and should the class of manures just mentioned prove equally valuable for promoting the growth of Flax as they have done for that of most of our other crops, they will remove one of the greatest obstacles to its culture, especially on inferior soils. Liquid manure is, however, advantageously applied to the Flax-crop in Flanders, and other Flax-growing districts on the Continent, the quantity being regulated by the wants of the soil. The effect of enriching the soil beyond a certain degree, for this crop, causes it to grow so luxuriantly, that the strength of the stem is unable to maintain it in an erect position; and when laid down before being ready for pulling, the crop is altogether destroyed. In this respect, Flax is subject to the same rule as our cereal crops, to which an excess of manuring proves decidedly injurious, and differs from the root-crops, and the Clovers and Grasses for the successful growth of which an excess of fertility can scarcely exist in the soil.

The place for Flax in the rotation is after Lea, or a Corn-crop; and in the latter case it should be the second crop after the land is broken up from Grass. This, indeed, is the proper place for Flax in the course, and its introduction into general cultivation would, therefore, in some degree, derange the order in which the several crops of the farm succeed each other at present. It may be successfully grown after the land is taken up from Grass, as the first crop; but the preparation for the Flax is in this case more difficult, and a valuable Corn-crop may then be grown without injury to the succeeding crop of Flax; nay, with absolute advantage. It should not, by any means, come after Potatoes, or other green crop. This has been a common practice in Ireland, though always productive of coarse fibre. Another important consideration in determining the place for Flax is, that it must not be grown on land which has been recently limed; certainly, not sooner than the third or fourth year. On many of the rich heavy soils throughout the north of Ireland, on which Flax had formerly been grown with the greatest success, it does not succeed from this cause alone. Lastly, it must not be frequently repeated on the same land—not oftener than once in every seven or eight years. The Flemings consider this circumstance of much importance, and arrange the divisions of their small farms so that the Flax crop, which they consider their golden one, shall not be cultivated on the same ground oftener than every ten or twelve years.

The preparation of the land for Flax should be similar to that for the Carrot—perfect pulverisation of the soil to a considerable depth, and the thorough eradication of weeds being the objects to be attained. The means to be employed for attaining these conditions, it does not seem necessary to describe at length in this place. The usual early ploughing in the autumn, with two further ploughings in the spring, assisted by the action of the harrow and roller, will, in general, be sufficient for this purpose. Deep pulverisation is much more important in the preparation of the land for Flax, than is usually imagined; it having been repeatedly ascertained that, under favourable circumstances, the roots of the plants will strike into the ground fully one-third of the entire length of the stalk.

To ensure the regular and even germination of the seeds, the surface of the ground should be firm and perfectly level before sowing. It is usual, immediately before sowing, to give a good rolling to the ground, after which light harrows follow, before the seeds are sown. Another slight harrowing and rolling afterwards finish the seed process. The proper seed-time is during the month o April, and as early as possible in the month, the precise

period being of course regulated by the weather and consequent state of the land. Flax is repeatedly sown in Ireland in the month of May, and often at a late period of the month, although experience has abundantly confirmed the propriety of an earlier seed-time.

The quantity of seed will in some degree depend on the chief object in view in the cultivation of the crop; but in these countries hitherto it has almost exclusively been cultivated for its fibre, the seed being, in the majority of cases, altogether disregarded, and allowed to go to waste; and there is little doubt that the prevailing practice has been to use too small a quantity of seed. When the saving of seed is a principal object, thin sowing will better answer the purpose in view. The production of the largest quantity of seed is indeed incompatible with the greatest return from the fibre; but the latter being the more valuable, the production of seed is to be regarded as a secondary consideration. Thin-sown Flax branches much towards the top, which produces an increased quantity of seed. It is, however, worthy of remark, that the plants from which the finest fibre is produced have rarely more than one seed-pod each,—in fact, not more than one in twenty having more than a single capsule. The cultivator, therefore, may be assured that when his Flax appears in any degree branched, that too small a quantity of seed has been used, and that an inferior sample will be the certain result. No doubt can be entertained that a sufficient quantity of seed has not been generally used in the cultivation of this crop. The stalks of Flax may, in fact, be aptly compared to trees in a plantation,—those standing closely together, from which alone fine fibre can be produced, being tall and slightly branched, while those standing at greater distances will be short and branched from top to bottom. About three bushels, or nine pecks, to the statute acre, will be the proper quantity; and if fibre of an extraordinary degree of fineness be required, another gallon or two should be added. This is a close approximation to the quantity used in the most celebrated Flax-growing districts on the Continent.

It is, perhaps, almost unnecessary to mention that the Flax-grower should ascertain that the seed he employs is of good quality, and free from any admixture of the seeds of weeds. Great circumspection is, however, required on these points, as large quantities are annually imported for sowing altogether unfit for that purpose, and the importation of which would not be attempted, were it not that what remains on hand after the seed-time is over can be advantageously disposed of to the oil-merchants. No crop requires greater care and attention than Flax, as it will either be a highly remunerating crop, or a ruinous one, according to the course of proceeding adopted; and it is especially important that the farmer should secure genuine seed, which will be smooth, bright, plump, and so heavy that it will sink in water.—*J. Sproule.*

GEOLOGY AND AGRICULTURE.

We have been informed, upon authority on which we can rely, that one of our most eminent living geologists received, in the early part of his career, many a lecture from an uncle engaged in commerce, for wasting time and talents on so frivolous and unprofitable a study. When Geology had raised the nephew to a professor's chair—to affluence and celebrity—his uncle used to exclaim—"Ah! it was I who advised him to apply himself to that pursuit." The fate of the science itself has been somewhat similar. It had a long noviciate of obloquy to endure—it is now beginning to reap its honours and emoluments. Long after the mercantile uncle had given his sanction to the studies of his nephew the Professor, a farmer, land-surveyor, or land agent, would have run considerable risk of having his reputation as a practical man damaged by possessing a geological hammer, or collecting organic remains. Geologists were looked upon as a set of cracked-brained enthusiasts, if not something worse, who went about breaking stones "like road-makers run daft." They themselves occasionally descanted on the advantages which the Agriculturist, the miner, the engineer, the architect, and even the surveyor of parish roads, might derive from the study of the materials composing the crust of the earth, the order in which they are arranged, the organic remains by which the sedimentary rocks are characterised, and the agencies at work in modifying the surface of the earth. Such assertions, however, were received either with peals of derision, or smiles of incredulity. Now the tide has turned, and there is a disposition to give to Geology the credit, not only of its own merits, but of those which it derives mainly from its connexion with other sciences.

Having long been of the number of the knights of the hammer, which we have wielded through evil report and good report, with much pleasure, and, we hope, some little advantage, we rejoice at the homage now paid to the economic value of Geology, applied to the improvement of the soil; but we cannot consent that chemistry should be robbed of its fair share of the honour. In our view of the case, it is from the knowledge of chemistry, involved in a knowledge of Geology, that its value to those engaged in the cultivation of the soil depends. Geology, it is true, teaches us to look below the surface to the subsoil, and establishes the connexion of both with the rocks from which they are derived; but it is the knowledge of the chemical composition of those rocks which gives value to that connexion. That amount of chemical knowledge, of which none engaged in the improvement of the soil or the management of landed property ought to be destitute, every geologist must possess. One of the first lessons which he learns is a knowledge of the simple minerals whose combinations constitute rocks; and, to discriminate one simple mineral from another, he must have recourse, not only to their external but their chemical characters. The blow-pipe and the test-tube will be his best guides; and thus, before he can make himself master of even the rudiments of Geology, he must have acquired a considerable degree of expertness in, at least, qualitative analysis. He will have learned how to detect the presence of lime and magnesia, of potash and soda, of the phosphoric, sulphuric, and hydrochloric acids, and of the oxides of iron and manganese. When he finds these substances present in a solution which he is examining, the laws of chemical affinity will indicate which of them must have been combined, and those of definite proportion will show the quantity of one substance which must have been united with a given weight of another. The Geologist has learned, moreover, to observe how the varying proportions of the earths and alkalies, in the different varieties of granite, syenite, greenstone, and basalt, affect the external characters; he has also learned the effects of varying chemical composition and state of crystallisation in promoting or retarding the disintegration of rocks; thus influencing their capability of forming soils or mineral manures, and of yielding their constituents for the use of vegetation. It was not, however, till the recent advances were made in organic chemistry, that the knowledge possessed by the Geologist of the chemical composition of soils acquired its full value. While chemists were looking for the organic constituents of plants in the soil, instead of in the atmosphere, and treating their inorganic constituents as mere accidents, their analyses of a soil in which they only estimated the proportions of the silica, alumina, lime, and humus, did little more than indicate its mechanical texture, which might be ascertained by simpler means. But when the paramount importance of the alkalies, alkaline earths, and acids, to the wants of vegetation was established,—when it was shown that within certain limits the proportions of these were constant in the ashes of certain tribes of plants, and that the most fertile soils were those which contained these substances in the largest proportions, Geology and Agriculture were furnished with a new sense.—*J. Trimmer.*

(To be continued.)

ON THE ROT IN POTATOES.

No remedy has hitherto been found for preventing this disease; nor has, I believe, any of importance been suggested; meanwhile it is increasing in many places in a fearful degree, and it is the duty of every one who takes an interest in the welfare of his fellow men to contribute his mite towards the effective staying of the evil. It is with this view that I take the liberty of adding my little experience to what is already known; and, should my opinion prove fallacious, it may, I trust, be the means of leading others to devote their attention to this highly-important subject.

I have thought for some time that the sprouting of Potatoes in cellars must have some effect on the healthy development of the future plant, and my late experience has led me to believe that my opinion is not without foundation. The cause of rot cannot lie in the soil, since we find healthy and diseased Potatoes growing beside each other; that is to say, on soils of the same constitution we sometimes find the rot in alternate plants, or in whole rows. It cannot be attributed to the atmosphere, as all plants and roots are equally surrounded by it; nor can the cause lie in the manure, as all the tubers receive the same kind and nearly the same quantity. It must, therefore, be attributed to the Potato itself; and I will now state my reasons for this belief. By careful inquiry among the farmers of Cheshire I found that they preferred those tubers which have sprouted in cellars, because they were sure that the plants would grow. The farmers, also, in this part of the country are remarkable for their tardiness in getting seeds and tubers into the soil, inasmuch as the tubers are frequently not planted until the commencement of May; they are likewise in the habit of setting cuttings, which are piled up into a heap and remain thus, perhaps, for a week or ten days before they are all planted. It is obvious that the warmth of April will cause these cuttings to sprout quickly, and the shoots put forth are always of a white colour, distinctly showing the absence of air and light, as is the case in cellars. On two farms in Lincolnshire which I have visited for the purpose of inquiring into the rot, I have found the same system pursued. In the town of Ballina (Ireland) and its neighbourhood, where the rot has never appeared, I have been told that all farmers, from the richest to the poorest, take especial care to select those Potatoes which have never sprouted in cellars, and to plant them as quickly as possible. Even there the Potatoes are beginning to degenerate, owing to the practice of planting Potatoes year after year in the same field. They do not rot but get smaller in size. An alkali of a very deleterious nature, *solanin*, is formed in the sprouts of Potatoes which shoot in cellars, while not a trace of it is to be found in the stalks of those grown in soil. How far this tends to injure the tuber I have not hitherto been able to ascertain; but I think it highly probable that it may have such a tendency. After Easter it is my intention to analyse the tubers of such Potatoes as have sprouted in cellars, in order to ascertain the change that has taken place. It is not, I think, probable that the degeneration of the tuber in one year should immediately induce rot; but that by neglect transformations have been going on for years which have ultimately led to it. Experiments might easily be instituted to show how far such shoots produced in cellars affect the crops, and it is certainly worth ascertaining. I hope to be able to make a series of experiments this year on this interesting subject, the results of which I shall not fail to communicate.

As the time for setting is fast approaching I may perhaps be allowed to make the following suggestions on the subject:—1. A species of Potato should be selected in which the rot has not yet appeared. 2. Whole tubers should be set instead of cuttings, and small but healthy ones should be selected for the purpose. 3. Especial care should be taken to set only those with healthy eyes and with sprouts. 4. They should not be set so deep as to exclude the influence of the air, nor so close together as that tubers of one plant should be formed at the expense of another. 5. For the sake of economy the Potato should not be allowed to come into flower, but the buds should be carefully nipped off. 6. The best manure will be guano and carbonate of soda, or thoroughly decayed farmyard manure.

Should all these precautions fail, no hope is left but to grow seeds of Potatoes in which the rot has never appeared, and to rear fresh tubers from seeds. The tubers for setting should be kept in a cool cellar, of as equal a temperature as is possible, and should not be planted later than the middle of April.—*A. B.*

ON MINERAL AND INORGANIC MANURES. No. XIII.

By Professor Charles Sprengel.

(Continued from page 202.)

After the application of marl, some weeds will disappear entirely, whilst others, which have not existed previously, will appear; thus, for instance, the growth of the golden Daisy, which is known to be a most mischievous weed, is altogether prevented by marl. I have found by experiment that marl which suppresses this weed is rich in oxide of manganese, and the plants contain but a trace of that mineral. Amongst the weeds suppressed by marl are Quick-grass and Bank-cresses, whilst it advances very much the blue Corn flower, the red Poppy, wild Oat, the bitter Vetch, and the wild Vetch. In order to hinder the increase of the weeds which are strengthened by marl, it is necessary to plant the crops in such a succession as will assist in their destruction. It would therefore be very erroneous, if on marled fields Rye should be often followed by Rye, as in this case the Corn flower, &c. would annually come to maturity, and the fields would be finally quite overrun with such weeds. The fact that marl advances the growth of some weeds, deters some farmers who are in the habit of growing Corn after Corn from its use.

All crops grown after marl are not only more relished by cattle, but also (as has been stated before) more nutritious than others; and this alone may induce farmers to use marl wherever it is at hand. This phenomenon is easily explained, by the fact that animal bodies require for their chemical constitution the very same elementary substances that plants do. By marl the soil is supplied with phosphate of lime, soda, chlorine; and, as the crops also will contain more of these substances than those previously grown, it is obvious that the animals will obtain thereby more of those very mineral substances which are necessary for their life. To this is to be added, that plants grown after marl contain more starch and sugar, and less of acid; so that on that account also they are more nourishing and palatable to the cattle. How much animals prefer plants grown after marl to those grown after other manures may best be observed on the limits of fields differently treated in this respect; because, whilst they always eat up the Grasses and weeds grown on the one to the very roots, those of the other are left untouched to a considerable height.

Experience shows, that of all the Cerealia, Oats will grow best after marl. The reason may be, that Oats are a very scourging crop, and grow better where the marl offers to it a great amount of available coal of humus. Whoever, therefore, may wish to exhaust a marled field requires only to plant Oats several times after each other. It has been further often observed that marl does not mature crops as early as lime does. It may be supposed that this is caused by the former being able to nourish the plants longer than the latter. Lime might also bring on the earlier maturity of crops by its corroding properties, as a small portion of it remains pretty long in a caustic state. If marl is brought on meadows covered with moss, it will destroy it, and elicit a quantity of Grasses, Covers and Vetches, in which respect it acts similarly to lime but better, as it nourishes the plants to a greater extent than lime, on account of its more numerous mineral ingredients. Lime destroys the mosses, and ope as it were, the carbonic humus of the soil, which equally accomplished by marl, though in a less deg The main rules which are to be observed in the us marl are the following:—It is of importance that be mixed with the furrow-slice as intimately as pose, especially if large quantities of clay marl (80 to 90 per acre) are brought on the field; because it mu only come into close contact with the humic parts soil which it has to decompose, but it is always in to vegetation if the roots of plants do not find a hge neous soil to live in. The intimate mixing of t with the soil is best produced by its being spread heaps over the field, and left lying thus until mences to fall to pieces; then it is broken still some dung-forks, and strewed about with a sho that, it is left quiet for some time, for the sake perfect disintegration; after which it is harro field is gone over with an inverted harrow; th is rolled over, again harrowed, which is alter nued in favourable weather until the marl h verted almost into a fine powder. Finally, it ough under in dry weather; the field is then har time afterwards ploughed somewhat deepe harrowed. The long exposure of marl to t

often working it up with harrow and roller is, as before said, especially indispensable with those sorts which contain much protoxide of iron; because, to render this harmless to vegetation, it must be converted, by the action of the atmospheric oxygen, before being ploughed under, into a real oxide. It is very probable that, during this process, ammonia will be formed by the decomposition of water, which shall be s ated afterwards under the head of "Manuring with Burnt Clay." Clay marl will best fall to pieces during winter, under the influence of the frost; and therefore winter is the general season for applying it, and then it is worked during the spring and summer. Before the marl is brought on the field, it should be ploughed, as the first harrowing will then somewhat mix it with the soil.

(To be continued.)

WOODEN SHOES.

BY MARTIN DOYLE.

Various have been the suggestions for improving the condition of our labouring classes in Ireland, and numerous the dispensers of bounty, according to their individual notions of what might be most conducive to the end proposed. Some benefactors begin with the head, and seek to act upon the intellectual portion of the body by education, or agitation, as the case may be; others, preferring a middle course, and believing that hunger is a great impediment to the development of mental power, go directly to the stomach, advising "to fill the belly first."

I myself have made some unsuccessful experiments regarding the attic and middle stories of Pat's framework; but on this occasion I shall try what may be done with the basement, and suggest an efficacious mode of keeping his toes dry and warm, well knowing, from my own personal experience, the corresponding effects produced upon the upper extremity of the human column, by the good or bad condition of the pedestal upon which it rests.

I begin with childhood. It is absurd to affirm that children will be rendered hardy by being kept barefooted; this is the way to mar and not to make the constitution. Even before they can walk, their feet, in cold or moist weather especially, should be cased in warm covering, to preserve a sufficient circulation of blood in the lower extremities, which relieves feverishness in the time of dentition. And when the little creatures can paddle about, it is still more necessary to have their feet protected from the moisture of the cabin-floor, or the water in the ditch at the door, in which they are perpetually puddling, when they can escape from the mother's eye.

Whenever I look at the purple legs and feet of a child, which perhaps has at the same time the hooping-cough, or the measles in some alarming stage, or is enduring the tortures of teething, and entreat the parents to get shoes for the sufferer, immediately I anticipate the answers that will be given to my question, Why do you keep the feet bare? The replies are of the following kind:—Shoes are too dear for the likes of them; we think worse of the other children, or of ourselves, that must be out in the fields, or upon the road; or that plaguy shoemaker, Leatherstitch, disappointed us last Sunday; or the pair he made was too small; or the child burned a hole in one of 'em. I often see the mother of a family dragging her feet along in a broken pair of old unmatched slippers, to wash a basket of Potatoes in a stream, which flows in and out of her shoes; or standing in wet mud by the side of a pool, as she washes some of the duds of the family, all the time coughing and wheezing; it is plain that the want of shoes is among her chief deficiencies.

A good pair of shoes cost 5*s.*; and if she has such, she cannot afford to wear them, except on Sundays; and thus, from necessity, or economy, she plashes about in a broken useless pair, or goes altogether barefooted on the other six days of the week, until she contracts some alarming disorder: then, indeed, she begins to suspect that her illness might have been brought on from having worn very bad shoes, or having been barefooted. She is thus rendered incapable of that labour by which she might have earned the price of a pair, or is sent prematurely to the grave.

I have witnessed innumerable instances of fatal diseases in children especially, from deficiencies in this particular. We frequently see in Ireland poor females of town populations trudging about from one street or lane to another, sunk to their ankles in mud, with their feet wet, yet encased in the cast-off bombazin shoes of some lady, or would-be lady, who is charitable without being out of pocket, and could no longer make use of them herself; and we also see in the wintry season many a group of beggar children standing in agony on a frozen pavement, or snow-covered flags, without even the fragment of a shoe, or at the best, with only one, to defend a sore foot, and that one tied round with a piece of twine to keep it together, or stuffed with straw to make it fit.

It is grievous to refuse a pair of old slippers to a poor creature who imploringly asks you for them in God's name, to allay the agonies of feet tender from journeying on rugged roads or thorny paths; and this, when we ourselves are conscious of possessing at home shoes and boots in abundance for every season—every purpose. Many a time have I been asked for a single old shoe, to save one cold disabled foot, the other being less delicate, or already provided with an odd slipper; and I have been deeply pained at refusing the solicitation. Yet there are objections to leather shoes for the poor, even where they are attainable. What a great deal of time is lost in repairing them! Every labourer, male and female, knows this. In the busy spring season, when a farmer goes out among his work-people, and expects to find Andy Callaghan, one of his best men, at some important labour, he is told that Andy was obliged to stay at home to put a sole or a toe-piece to his shoes. Then he asks, as he sees two of his required number of Potato-setters absent—Where is Judy Kennessy? "She went to town to-day to try if she could make off a pair of shoes." Where the mischief is Peg Hoollahan? "She lent her pair of brogues to her sister, who was obliged to go to the chapel to-day." The wants, delays, and disappointments in this way are innumerable, and of every-day occurrence.

For attaining the object which I have at present in view, I know no means more likely to succeed than the distribution of the sabot, or wooden shoe, by landlords and employers of labourers, among their working-people. In France, a climate in which there is far less need of such a comfort than in that of ours, 9 out of 10 of the lower classes, both in town and country,—petty shopkeepers, petty farmers, operatives of all kinds, age, and young people of a higher grade, in the fields, in the streets, at home, or going to school or college,—one and all wear wooden shoes.

Wooden shoes and brass money! there is a supposed connexion between these; and if I can show clearly that a little brass money can buy large wooden shoes, and can persuade any influential persons to introduce a practice adopted by many millions of the French people, and approved from long experience of its economy and comfort, I shall not have written this paper in vain.

(To be continued.)

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. XIII.

(Continued from p. 203.)

I will take as practical illustrations, the experiments related in your Paper of this day (Feb. 17), by two of your most valuable Correspondents, and I feel confident that these gentlemen will assist me in proving the correctness or error of my views by further experiments.

In the paper of Mr. Grey of Dilston, two series of comparative experiments were performed with nitrate of soda and gypsum—one upon Grass-land, the other upon Potatoes. In the first experiment Mr. Grey procured 65 stone more Hay from land manured with 1 cwt. of nitrate of soda over that treated with 10 bushels of gypsum; while the land treated with gypsum had no increase over that where no manure was applied. It is impossible to have a stronger confirmation of my views than this experiment affords. "The Grass to which the nitrate was applied," says Mr. Grey, "assumed in a few days a darker colour than the other, rose quickly above it in height came earlier into seed, and was sooner fit for cutting." Here we have abundance of crops from abundance of material; and Mr. Grey, had he analysed his Hay, would have found the alkali in its ashes. Gypsum, on the contrary, acts slowly, by absorbing ammonia from rain-water. And the azotised part of the plant may during the growing of the Grass have received no addition whatever from the gypsum, as it is clear it did not; gypsum requires moisture and time before it acts as a manuring agent at all; whereas the soda enters at once into the fabric of the plant, and it is of great use, particularly in Grass; for without it the cows which feed upon it could not secrete milk.

In the experiment upon Potatoes Mr. Grey says—"I applied the nitrate of soda to a row of Potatoes, at an early period of their growth. The tops soon showed the effect, and far outstripped the adjoining rows in growth. But when the Potatoes were taken up, the produce of that row was found to be less than the other, both in weight and measure." Here we have food given to the top and none to tuber; and the vital action was expended in assimilating this food to the formation of branches and leaves. Had Mr. Grey added rotten stable manure to the nitrate, the result would have been different; had he added urine, more carbon would have been fixed in the tuber; had he supplied phosphates, more tuberous matter would have been formed; but he only supplied material for the top, and therefore top alone was developed.

The second experiment to which I will allude is that of Mr. Lawes, who separated the phosphate of lime from the gelatinous matter of bones, and performed a comparative experiment upon Turnips, from which he draws the inference that the result, being in favour of the phosphate, proved that the latter, and not the azotised principle, was the fertilising property of bones. I am aware that Liebig is of the same opinion, and I do not deny the fact. But the experiment of Mr. Lawes does not prove it. In the first place, the azotised matter was not presented to the plant under favourable circumstances for the development of the nitrogen. By heating and reducing to powder the gelatinous matter, a considerable proportion of the azote would be dissipated, as carbonate of ammonia, and the portion that remained as dried powder would resist the agency of decomposition much longer than had it been simply crushed and used, as bone-dust usually is. In the second place, the experiment, I think, ought to have been tried with an azotised crop, as Wheat or Beans. Gelatine contains more nitrogen than any other element of animal food; but it has this characteristic difference, that, while albumen, fibrin, or caseine are formed equally by plants and animals, gelatine is the exclusive product of animal organisation—it is the result of the metamorphosis of albumen. But it is a curious fact, the knowledge of which we owe to Liebig, that while gelatine is formed from the blood, it is incapable of being reconverted into blood. It differs also from albumen and fibrin, in containing no phosphorus or sulphur.

Now these facts prove that as gelatine it can afford no nourishment to the plant; but they do not oppose the fact, that gelatine by decomposition, under favourable circumstances, produces ammonia, which yields the nitrogen of the gluten in Wheat, or of the small proportion of albumen in Turnips. It is well known that bones will putrefy, and that carbonate of ammonia is the result. We must not then reject as useless the gelatinous part of bones, but endeavour to convert its elements into a form by which it can be taken up by the plant. We must expose it to the action of decomposing agents in the first place, and then fix the volatile salt of ammonia, by sulphuric acid or other media. A question of great importance in the nutritive physiology of plants here presents itself, and as it bears materially upon the views which I advocate, I will briefly allude to it:—

In a late work—which I cannot help regretting he ever wrote*—Liebig dwells much upon the notion that plants derive their ammonia, as well as their carbon, from the atmosphere. The presence of ammonia in rain-water is undoubted—it is one of the facts which Liebig has made known to modern science. Now Liebig states that if you supply a plant with the phosphates, you will enable it to imbibe, through its leaves, more ammonia from the atmosphere; in the same way as he contends that if you supply the roots of a plant with azote, you enable it to fix more carbon in its organism. I have in a previous paper contended that the carbon of plants can only be increased by the action of azote, in a quantity sufficient to form albumen, with the imbibed nitrogen. I contend that the same argument applies with equal force to the phosphates, and that the absorption of phosphorus by the roots of the plant can only fix as much ammonia from the atmosphere as is necessary to produce albumen. Now, the proportion of phosphorus in albumen is so minute, that chemists have not hitherto fixed it by any figure, and therefore the assumption that phosphorus taken up by the roots, induces the plant to absorb ammonia from the atmosphere, can only be correct in a very limited sense. But the amount of phosphate of lime in the seeds of plants is much greater than the phosphorus in the albumen of the plant; and as plants must be supplied with the elements necessary for the formation of the different parts of their organism, or the whole cannot be perfected, and as the phosphates are the most frequently absent from soils, and the most constantly exhausted from soils, we have no difficulty whatever in accounting for their utility as manures. If a plant absorbs by its leaves ammonia, and the nitrogen of that ammonia does not meet with the other corresponding elements of albumen, the carbon, the hydrogen, the oxygen, the sulphur, and the phosphorus—why, of course no albumen or gluten can be formed. But the assumption that the phosphorus by any peculiar virtue of its own has the power of fixing nitrogen and forming albumen, is assigning to an element the function of a perfect plant, which might, with equal propriety, be claimed by the sulphur, the carbon, or the elements of water. But I fear a continuation of this discussion will not be sufficiently clear to the general reader, and I will therefore proceed with my subject.—*C. R. Bree, Stowmarket.*

* Chemical Letters to a Friend.

Home Correspondence.

Yew.—Caution to Farmers.—In reference to what is stated at page 142 of the *Agricultural Gazette*, of four bullocks being poisoned by eating Yew, I observe that what I have invariably noticed respecting animals being poisoned by it, holds good, viz., that the Yew had been cut a few days before. Any animal, at least the horse, ass, cow, and sheep, may and do eat the Yew with perfect impunity from the living tree, but a very small quantity, if it is in a withered state, I believe always kills. I used to live in a neighbourhood where there were many of these trees, and, as a boy, was much puzzled to see all the above-mentioned animals eating the twigs with much relish (and I have at the present moment four smallish shrubby trees which my young stock and sheep have fed upon repeatedly this winter) and without harm; and yet every now and then some valuable cattle died suddenly, and on examining the stomachs were evidently poisoned by Yew. This made me reflect upon the subject, and I found that, if withered, it is a deadly and quick poison; if green, perfectly harmless, and much relished at times. I should be glad to know if the above agrees with the experience of your readers. I suspect that the same thing holds good with regard to the common Laurel. All the above animals eat it when green without hurt, unless perhaps taken in very great quantity; but a very small piece in a withered state will kill a pig. I lost several from it some years since, as was proved on dissection; and believe others had died from it, without, however, the cause being known. At all events, since the cuttings of the Laurels have been carefully put away, as I always do with Yew also, I have had no more sudden and unexplained deaths.—*Steaming Apparatus, p.* 142.—"A Subscriber" would find that no root pays better for steaming than the Swede Turnip, for horses, cows, and pigs.—*Swedes.*—By transplanting Swedes, you may secure a crop if the weather be favourable, but it will not be near so heavy a one as by sowing. Transplanting is only valuable when either from your land not being in a fit state you cannot sow them in time, or when you get a crop of the early Potatoes or Vetches. In the latter case, however, a much more valuable crop may generally be obtained by sowing either white, or some of the late yellow Turnips, which form in spring a most useful help either for sheep or calves, as I am experiencing at the present moment, having 40 ewes with their lambs doing very well upon but a small quantity of land sowed after early Potatoes and Vetches; and I have also six cows soiled upon this, giving butter as sweet as if upon meadow grass. The complaints about Turnips tainting milk may always be obviated by your plan of saltpetre, if the pans are kept clean.

and the decayed leaves of Turnips not given to the cows. Indeed, if complete cleanliness is adhered to by cowmen and dairymen, there will be little or no bad taste even without nitre. I keep my cows upon Turnips as the succulent part of their food, upon at least nine months of the twelve, and find no difficulty when cleanliness is adhered to.—*W. D. F.*

Experiments with different Manures on the Potato Crop.—The following experiments on the application of various manures to the Potato crop was tried last season, and as the mode of culture adopted differs from the usual practice, a few words of explanation on that subject are necessary. The land is of very superior quality, consisting of a moderately tenacious clay, through which a considerable portion of an impure carbonate of lime is interspersed, part of which is incorporated with the soil, and part occurs in the form of small stones, which, however, are rarely of such a size as to form any obstacle to the operations of tillage. It had been previously many years in Grass, and being merely marked out into ridges by the common plough, the Potatoes were planted on the surface without any manure. This practice is well known throughout a great part of Ireland; it is also usual to let the land in this state to produce a crop of Potatoes to the neighbouring cottagers, and from 4*l.* to 6*l.* per acre are frequently obtained for this purpose. This is the Corn-acre system, which has at different periods attracted public attention, as one of the causes for much of the pauperism in this country; but to this subject it is not necessary to make any further allusion in this place. The Potatoes were planted on the 15th of April, and were of the variety called Cups, which I believe are generally known. The ridges were five feet wide, five sets being placed across the ridges, being thus nearly a foot distant across, and nearly eighteen inches distant in the other direction. These were covered about three inches deep with the earth out of the furrows. Before the young shoots had reached the surface through their covering, the various manures were spread on the surface in the proportions stated below. An additional covering of earth, two inches deep, was then put over the ridges. The application of the manures and the covering of earth took place the same day, on the 20th of May. On the 15th of June the spaces between the rows across the ridges were loosened by the hoe and drawn up to the stems of the plants, forming, in fact, drills as it were across the ridges. The Potatoes were taken up on the 10th of October, and the following table exhibits the results :—

Kind of Manure.	Quantity applied per acre.	Produce per acre.	Cost of application.
		Tons Cwt.	£ s. d.
1. Guano	3 cwt.	19 11	2 2 0
2. Bone dust	18 bushels	15 13	2 5 0
3. Nitrate of Soda	2 cwt.	16 19	1 16 8
4. Nitrate of potash	2 cwt.	15 5	2 14 0
5. Muriate of ammonia	2 cwt.	17 15	2 15 6
6. Salt and quick-lime in equal quantities	8 cwt.	14 17	0 12 0
7. Farm-yard manure	10 tons	16 3	
8. No manure applied		13 10	

The farm-yard manure was that of the preceding season which had remained over in the yard, and was therefore well decomposed. Each of the other manures was mixed with a small portion of dried earth a few days before being applied. The common salt was obtained from a provision store, and contained a considerable portion of animal matter, as blood and pieces of fat, though its effects in combination with the lime were not very great. The whole of the manures applied were successful in so far as having considerably overpaid the original outlay. Another circumstance I may here mention as worthy of observation :—The produce of two equal portions of the crop to which no manure had been applied, the earth in the one case having been hoed between the plants and drawn up to their stems, and the other not, showed clearly the advantage of the former treatment, the difference in produce being no less than one ton and three quarters per acre. This work was performed by boys and girls under the superintendence of an experienced labourer, and the entire outlay did not exceed 7*s.* 6*d.* per acre. It is perhaps necessary to add that the statute acre is that referred to in the preceding remarks, although here all calculations are made in plantation measure of 49 square yards to the perch.—*W. Smyth, Mitchelstown, Kells.*

African Guano.—As you have made more than one reference in your publication, to the recent importations of guano from Africa, we beg to send you Dr. Ure's analysis of a cargo we lately received from thence, accompanied by his observations thereon. This cargo was from a different island, and considered much superior in quality to that by the Levenside, alluded to in your paper, and was sold deliverable from the ship at an average price of 7*l.* per ton.—*Lodge, Prichard, and Co., Liverpool.*

[Report, &c., by Andrew Ure, M.D. F.R.S., Professor of Chemistry, &c.]—This is the first sample of clean guano from Africa which I have seen. It has been very carefully collected, and contains no heterogeneous impurities. Its specific gravity is only 1.57 to water 1.00. Impure and decayed guano is always much denser, being sometimes so high as 1.80 or 1.90. 100 parts of this African guano contain 10 parts of ready formed ammonia, equivalent to about 32 parts of sal ammoniac, and to nearly 40 of sulphate of ammonia. 100 parts contain 21½ of moisture, separable by the heat of boiling water; 100 parts lose 50 parts of volatile saline and organic matter, including the 10 parts of ammonia, by a red heat, besides the 21½ of water, and leave 28½ of white matter, which is chiefly phosphate of lime, with a little phosphate of magnesia and some sulphate and muriate of potash, with a little phosphate of the same alkali. 100 parts contain only one of siliceous sand, showing the guano to be the genuine excrement of the birds. The whole constituents may be thus stated :—

Saline and organic matter, containing 10 parts of pure ammonia	50.0
Water	21.5
Phosphate of lime and magnesia, as also potash.	26.0
Silica	1.0
Sulphate and muriate of potash	1.5
	100.

London, March 12, 1844. (Signed) Andrew Ure.

The Symphytum Asperrimum, or Prickly Comfrey is a native of Caucasus. It grows to the height of five feet, and is hardy enough for any soil or situation; it produces abundance of nutritious green food from the beginning of May to the end of October, for cows, sheep, pigs, and especially for horses, it being glutinous and not purgative. It is a perennial, a strong grower, when once planted, and requires little trouble more than to be kept free from weeds; it is particularly adapted for spade-husbandry, and very suitable for those who have more garden ground than they require for vegetables. The soil should be of a nature to bear trenching two feet, and free from stagnant water. The ground should be well manured when first planted, and the distance from plant to plant should be two and a half feet, 6962 to the acre; and as one plant of the middle growth, when cut, will weigh eight lbs., this will amount to upwards of 24 tons. When the ground is good and well-managed, it may be cut four times in six months, thus yielding 96 tons per acre per annum. It should be cut close to the ground a few weeks after planting; it will then be established, and at every successive cropping produce more shoots and an increase of crop. April is the best month to plant, but I do not know where plants may be procured, but presume at the nurserymens'. —*F. C. S.*

Manures.—It is well known to every cultivator of the soil that no land will continue productive if some equivalent for its produce be not returned to it. If the land is always yielding and never receiving, it must in a short time become barren. However, there are particular soils, like those of Egypt, which, being annually overflowed, derive a valuable manure from the hand of Nature, and therefore cannot be rendered barren by bad husbandry or over-cropping. There are also some soils in our own country which are not easily exhausted, in consequence of being composed of materials which attract and retain the food of plants. Taking these things into consideration, we consider it a duty incumbent on all cultivators of the soil to use every means to promote its fertility, in the most simple and efficacious manner. We are fully convinced that if more attention were paid to the making of farm-yard manure, instead of running after every new importation, which has nothing but a fine advertisement to recommend it, and, in nine cases out of ten, fails to produce the expected crop, they would, at the year's end, find their purses heavier, and their land in better heart. In the north of Scotland, the small farmers and cottagers pay great attention to the making of manure from their pigs, by bedding them with leaves, Moss, Rushes, Grass, Fern; all of which materials make excellent manure, when trodden under foot and saturated with the urine of animals. In fact, if the small farmers of the north of Scotland did not use some such materials, they could not afford to bed their cattle with straw, which forms their principal food, with Turnips or Potatoes, during the winter months. We have lately noticed, in some parts of Ireland, bog-earth employed for bedding cows and pigs; this material makes an excellent manure, especially if it has been well saturated with the urine of the cattle. We have seen better crops produced from land which has been manured with these materials, than the produce of any of our new importations. We do not wish, however, to condemn these imported manures, but we would have farmers pay more attention to the making of manure on their farms, and when made not to allow it to manure the atmosphere instead of the soil, which we are sorry to say is too common a practice, particularly in Ireland. We would recommend farmers to adopt the following plan: To every two cart-loads of farm-yard manure, add one of the scourings of ditches, road-scrapings, or a matted sward; if these materials are properly mixed with the dung, he will be amply compensated for any additional expense. The use of intermixing the soil with the dung is to imbibe the gaseous elements, and hinder their dissipation. Whenever putrid fermentation is going on in his dunghill, he should apply some earthy substance in sufficient quantity to imbibe and retain all effluvia. Health, profit, and cleanliness require such a proceeding. The farmer who arrests the rank vapours which emanate from decaying animal and vegetable matter, instead of permitting them to pass into, and contaminate the air he breathes, causes the atmosphere to be healthy, and supplies his crops with an abundant food.—*J. McI., Hillsborough.*

Mangold Wurzel.—Miss Edgeworth has somewhere said, that "half the mistakes of life arise from taking things for granted;" and if such of the readers of the *Gazette* as have not before met with this golden aphorism now treasure it up and act upon it, they, at least, will not grudge the half-column which my blunder, from neglecting it, has caused to be occupied by verbal criticism. The fact is, that having always seen the root in question called Mangel Wurzel, when spoken of on its introduction many years ago, I "took it for granted" that this was its genuine German name; but on consulting a learned friend versed in that language, he tells me that Mangold is there given as a name common to many plants, chiefly to a kind of Cabbage, and also to a sort of Beet, and consequently you are warranted in using Mangold Wurzel; and, as duplicate names are always objectionable, I would by no means advise its being called "Field Beet," or even by any of its native appellations of "Runkelrübe," &c., quoted by "A German."—*S.*

Points of Milch Cow.—The following may be useful to "G." in No. 12, on the points of a milch cow in Guernsey, taken from the Report of the Guernsey Agricultural Society :—1. Purity of breed and qualities of the dam for yielding rich and yellow butter. 2. Small head, large and bright eye, small muzzle, encircled with white or yellow, horns polished and slightly curved inwards, with black tips, small ears, orange-colour within. 3. Straight back from the shoulders to the tail, and chest wide. 4. A fine and loose skin, with soft and short hair and of a good colour. 5. Sides well rounded, flank small between the side and haunch, tail fine. 6. Fore legs straight and well-proportioned, hind legs broad above the knee, fine and clean below, hoofs small, legs should not cross in walking. 7. Udder large, and the teats large and springing from the four corners of the udder, milk vein large and well defined. The above are the chief requisites to entitle the animal to a prize.—*Guernsey.*

Festuca elatior.—I observe, that in answers to Agricultural questions in a late Number, you say that Festuca pratensis gigantea, and Festuca elatior are the same. I grow both side by side, on the same ground, and the observation of several years induces me to believe that they are not identical. F. gigantea blooms very early, even before the ordinary F. pratensis. F. elatior is considerably later in flowering. The husk and seed of F. gigantea, when ripe, are of a very light colour, almost white. F. elatior has seed of a dark-grayish brown, and does not ripen for a considerable time after the other. I have more reason to think that Festuca gigantea is the same as Festuca arundinacea, more nearly agreeing with it in its early growth, and the periods of flowering, and of ripening its seed.—*W. Pyle, Taunton.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

(*Continued from page* 221.)

Odessa Wheat.—The Hon. Sidney Herbert, M.P., Secretary of the Admiralty, communicated through Mr. Pusey, the wishes of the Agricultural Society at Odessa to enter into correspondence with the Society and receive its Journals; when the Council unanimously resolved, That the Imperial Agronomical Society at Odessa should be placed on the list of Corresponding Societies, and have the Journals in future transmitted to it, from time to time, as published.—The Hon. R. H. Clive, M.P., took that opportunity of calling the attention of the Council to the peculiar merits of the Odessa Wheat, and the importance of introducing and establishing its cultivation in this country. His brother, the Earl of Powis, had once possessed the variety in question, but by some unfortunate accident had, to his regret, again lost it. He regarded it as one of the most extraordinary Wheats ever grown, being a white soft Wheat of gigantic size and most beautiful colour. It was known at Odessa as the Taganrog Wheat; imported, he believed, into Taganrog, on the northern coast of the sea of Azov, from the surrounding agricultural districts, and shipped as an article of general commerce from Odessa, on the shores of the Black Sea, for western Europe.—Mr. John Hudson stated that large quantities of this variety of Wheat were to be obtained at Mark-lane; but being, as Mr. Gibbs remarked, kiln-dried before its exportation from Odessa, its vegetative powers were of course destroyed, and its employment for the purpose of seed-Wheat rendered useless.—Mr. Miles, M.P., hoped that by means of the new communication thus opened with the Agricultural Society at Odessa, a supply of the genuine Taganrog Wheat, in its natural state, and fit for seed, might be obtained in sufficient quantity to enable 30 or 40 members of the Society to cultivate an acre each, and report their results to the Council.—It was then resolved to refer the question to the Journal Committee.

Southampton Meeting.—Colonel Challoner, Vice-Chairman of the General Southampton Committee, transmitted to the Council the final Report of the Committee on the subject of the arrangements for the Pavilion and Show-yards at the ensuing Country Meeting in July; the Pavilion to be erected at Fairfield at an estimated expense of 620*l.*, and the Show-yards at Portswood at that of 1523*l.*, exclusively of the inclosures required by the stewards for the trial of implements to effect their arrangements in the most advantageous manner. This Report was received and adopted by the Council.

Heavy-Land Implements.—The Hon. M. W. B. Nugent, of Higham Grange, near Hinckley, Leicestershire, suggested to the Council, as the result of his close and constant attention in effecting the cultivation of 400 acres of some of the stiffest and unworkable soil in that county, that the land at Southampton upon which the ploughs for working the stiff clay are to be experimented, should as soon as possible be ploughed in preparation for the trial, and not again interfered with, but allowed in that state to retain its moisture until the ploughs to contend for the stiff-clay prizes shall be brought to plough it across upon the day of such trial :—a clean furrow-slice, under these circumstances, upon stiff retentive clay previously ploughed and suffered to keep all the damp in it, being, in Mr. Nugent's opinion, the criterion of a perfect plough for land of that character; so that it may be worked early in the spring and prepared for green cropping by such a plough as will not gather the stiff soil before the mould-board and run it before the mouth of the plough in large lumps; every single plough, he added, hitherto constructed, being guilty of this greatest of faults in working stiff, cold, retentive clay in a condition midway between wet and dry. The Council referred this suggestion to the Stewards of the Trial of Implements.

Annual Country Meetings.—On the motion of Mr. Miles, M.P., it was resolved: "That in future the

place of holding the Annual Country Meeting shall not be decided upon until a Committee of which at least three Members shall have acted as the Director or Stewards of the yard, (three to be a quorum, one of which shall have acted as Director or Steward), shall have visited and inspected such towns and their localities as the Council shall think fit, and have reported upon their respective suitableness for the purposes of the Society."

The Council then proceeded to the nomination of the following gentlemen, to form such committee:—Mr. Miles, M.P.; Hon. Captain Spencer; Colonel Austen; Mr. Barclay, M.P.; Mr. Childers, M.P.; Colonel Challoner; Mr. Dean; Mr. H. Gibbs; Mr. B. Gibbs; Mr. Fielder King; Mr. Shaw; Mr. Shelley.

Occupation of Sites.—On the motion of Mr. Miles, it was also decided, that in future the period during which the Society would require the land intended for the sites respectively of the Pavilion and Show-yards, would be "three months," instead of "six weeks," as stated in the queries decided upon by the Council in 1841, to be answered by the authorities of any town prior to its being qualified to compete for selection as the locality of the country meeting of any particular year: such occupation of the ground, however, by the Society's contractor of works not being understood to interfere with any right of pasturage up to the actual time of the meeting.

Country Meeting of 1845.—Viscount Hill, on the part of the town of Shrewsbury, and Mr. Brittain, jun. (Hon. Secretary of the Chester Agricultural Society), on that of the city of Chester, transmitted to the Council documents in favour of those places respectively, as sites for holding the country meeting of 1845.

I.—*Shrewsbury.* 1. Memorial from the Mayor and Corporation of Shrewsbury, under the Great Seal of the Borough, and signed by the Town-Clerk.

2. Memorial of the nobility, gentry, agriculturists, and inhabitants generally of the county and town of Salop; signed by Viscount Hill, Chairman of the public meeting held in the Shire Hall.

3. Memorial from the Inhabitants of the Town of Shrewsbury; signed by Edward Haycock, Esq., Mayor, and ninety-five of the principal inhabitants.

4. Memorial of the Shropshire Practical Farmers' Society; signed by Viscount Hill, President.

5. Answers to the Official Queries of the Society; signed by J. S. Peele, Esq., Town-Clerk of Shrewsbury.

6. General Plan of Shrewsbury, with the Show-ground, Trial-ground, Approaches, Public-rooms, and site for Pavilion, marked thereon.

7. Special Plans of the Race-course, and a room capable of accommodating 1200 persons at dinner.

II.—*Chester.* 1. Memorial from the City of Chester; signed by Henry Kelsall, Esq., Mayor.

2. Memorials from the South Cheshire, Denbighshire, and Flintshire, Anglesey, Holywell, Daresbury, Hawarden, Chester, and Wirral Agricultural Associations; signed by their respective officers.

3. Statement of the mode in which the requirements of the Council are proposed to be met in Chester.

4. Plan of the Marquis of Westminster's Schools.

5. General Plan of the City, and indications of the various points proposed in reference to the meeting.

6. Small plans of the City, showing the various lines of Railway connected therewith.

7. Table of Distances of the various Market-towns from Chester.

The whole of these Documents having been read to the Council, it was moved by Mr. Miles and resolved unanimously, "That a Meeting of the Committee appointed to consider the sites offered for holding the Country Meeting in 1845, be summoned for Wednesday the 17th of April, at eleven o'clock, to which the plans and papers, now submitted and read to the Council, be referred.

Appointment of Seedsmen.—Mr. Miles then brought forward the motion of which he had given notice, for the official appointment of Messrs. Thomas Gibbs and Co. as the recognised Seedsmen of the Society. He stated to the Council the peculiar claims of the Messrs. Gibbs on the honorary appointment now proposed to be bestowed upon them by the Council, the intimate connexion of Mr. Thomas Gibbs with the late Board of Agriculture, and the essential services he had rendered to its members—the kindness, utility, and gratuitous services of his sons to the present Society on so many occasions, and especially in reference to the business of the Country Meetings, and the notoriety of the firm for the excellence of their seeds, and the circumstance especially that the Society had always applied to them both for the uniform and requisite supply of seeds in model experiments, and for the test of cultivation or information required in the case of new seeds or plants of any kind transmitted to the Society; and concluded by remarking that as the Society had already made the honorary appointments of a consulting Chemist and Engineer, he did not think that the Council could pay a better compliment to those gentlemen than by appointing them to the honorary office in question. The President having borne testimony, on the part of the Smithfield Club, to the services gratuitously rendered by the Messrs. Gibbs to that body, Mr. Shaw seconded the motion, which, on being put from the chair, was carried unanimously, and Messrs. Thomas Gibbs and Co., of Half-moon-street, Piccadilly, declared to be duly appointed Seedsmen to the Society.

Glass Milk-pans.—Captain Stanley Carr, of Tüschenbeck, near Lübeck, transmitted to the Society, through Sir John W. Lubbock, Bart., and at the request of Mr. Handley, a specimen of the glass milk-pans employed so successfully in his German dairy, and referred to in his Paper on the Rural Economy of Schleswig, Holstein, and Lauenburg, in the first volume of the Society's Journal (page 380). "The milk," says Captain Carr, "when brought to the dairy, is immediately strained through a horse-hair sieve into the vessels, whether of wood, earthenware, copper-tinned, zinc, cast-iron (lined with a China-like composition), or glass, placed in rows on the floor. All these different kinds of utensils have been tried with various success, in the hope of discovering how, in hot weather, more especially when a thunder-storm is gathering, the milk can be guarded against a too early acidity; for, as it is a fixed and invariable rule that the cream must be removed from the milk before the latter gets at all sour, and an equally established fact, that all the oily particles cannot be obtained in a shorter period than 36 hours, vessels in which, during sultry, and especially damp weather, the milk could be kept the due time, are a great desideratum. As yet, however, there reigns much diversity of opinion on the subject; and shallow wooden vessels, as nearly as possible equally wide at top and bottom, containing when full about eight quarts, but in which, during summer, seldom more than six quarts are poured, are in most general use. They have, however, some disadvantages, of which the chief is, the great difficulty and the consequent labour and close attention requisite to remove all acidity (which in some states of the atmosphere is almost unavoidable), and which, penetrating the pores of the wood, sometimes resists all the patient scrubbing; first, with hot water and small birch scrubbers; and secondly, with boiling water and a hard round brush made of pigs' bristles (with which every hair'sbreadth is carefully polished over), so that the despairing dairy-maid is compelled to resort to washing in a ley of wood-ashes, or boiling, or even scorching over lighted chips, followed by countless rinsings in pure spring-water. To diminish in some measure this labour, the plan of painting the milk-pails and dishes with a preparation of cinnabar, linseed-oil, and litharge, has been adopted by the milk-vendors in towns, and in some country dairies; not only, however, is the expense considerable, as the vessels must be finished off with peculiar care, and require to get three coats of the composition at first, and one yearly afterwards, but the milk, for some days after they are brought into use, has a perceptible taste of paint. The tinned copper milk-pans are very costly, and must be carefully watched lest they should require re-tinning. The zinc are as yet little known, and the assertion of their effect in better severing the cream from the milk not sufficiently proved. The cast iron, lined with enamel, though assuredly durable and very clean, seem too expensive; and the glass have many opponents, on account of their brittleness, and the vague notions respecting glass and electricity, inducing the idea that if the electric fluid get into the milk, it cannot get out again! whereas, as it is ascertained that it always attaches itself to a conductor, and, in the absence of anything more attractive, runs along the surface, it is more likely that the milk should be protected in glass, which is a non-conductor, than in any other substance. In my dairy, which contains upwards of 180 cows, the glass vessels have been used for more than four years; and I give them a decided preference over all others. Their form is good, being 16 inches broad at the top and 12 at the bottom; the glass is dark bottle-green, transparent, and perfectly smooth, about one-eighth of an inch thick, and provided with a rounded rim at the upper edge, which makes it easy to retain a safe hold of them, even when full. They contain eight quarts, but never receive more than six. They cost 8*d.* a piece, and their durability may be estimated by the fact, that to encourage carefulness, each dairymaid is allowed one dollar per annum extra, as pan-money, being bound at the same time to pay 10*d.* for each one she breaks, yet hitherto no girl has broken to the extent of her dollar. It is self-evident that acidity cannot be communicated to glass, and the ease and rapidity with which they are cleaned, requiring merely to be first washed with lukewarm water, then rinsed in cold water and placed in a rack to dry, effect such a saving in fuel and labour (diminishing the number of our dairy-maids by at least two), that the less quantity of butter obtained, supposing (which I by no means concede) that the milk, during a few weeks in summer, does sour sooner, and consequently throws up less cream in glass than in wood, is more than compensated by the lessened expense of the establishment, not to mention the great advantage of attaining the indispensable cleanliness and purity of the vessels with more certainty, because at a less expenditure of time and trouble. Although it is an ascertained and undeniable fact that the quality of butter depends much on the nature of the pasture, the locality of the dairy, the universally prevailing cleanliness of the whole management, and very essentially on the purity of the water employed, still I ascribe much of the reputation which our butter has of late years enjoyed (and which is verified by our obtaining at all seasons one penny per pound above the market price in our neighbourhood) to the beneficial introduction of glass milk-dishes. At the suggestion of Mr. Hayter, M.P., it has been ascertained from Mr. Apsley Pellatt of the Falcon Glass Works, Blackfriars, that in consequence of the heavy duty and restrictions of the Excise on manufactured glass articles in this country, glass milk-pans of a size and shape similar to those of Captain Carr, but of white flint-glass and stronger mould, could not be made for sale in England for less than 7*s.* 6*d.* each: but should that price, under the restrictive circumstances of the case, obtain purchasers, there would be no difficulty in manufacturing a superior and serviceable article of the kind to any extent that might be required. The milk-pan presented by Captain Carr to the Society is of the common dark-green bottle-glass, and weighs 6¼ lbs. It is round in shape, and nearly 4 inches deep, measuring 17 inches across the outside of the top, and 11 inches across that of the bottom.

Siberian Cow-parsnip.—Captain Carr's communication contained also the following Agricultural references:—"There is nothing new here, except that spring is unusually long delayed, the ground still frozen up and likely to continue so, until we get a heavy gale with rain from the southward. The grain-crops of last year, especially Wheat, make the worst yield I ever remember. A new plant, Heracleum Sibiricum, has been successfully introduced here, as yet in a small way, from Russia, giving a very early and abundant food for sheep; but it is probably already known and valued in England: if not, I should have pleasure in sending you some seed. The last journals have been most interesting."

Mr. Gibbs informed the Council, that the plant in question was a very early green crop, although perhaps not quite so much so as the Prickly Comfrey: if allowed, however, to remain uncut for some time, it became at last the heavier crop of the two. He stated that the seeds should be sown in a bed, and the plants, when sufficiently large, planted out at least three feet apart, if in a soil likely to bring them to a large size. He believed the leaf constituted the only edible portion of the plant. Messrs. Thomas Gibbs and Co. having planted a small piece of ground, consisting of loam upon gravel, with the Heracleum Sibiricum, they found the leaves to be very succulent and to attain the great height of from seven to eight feet; and as the plant had not yet been extensively cultivated, they placed at the disposal of the Council, for distribution among such Members as felt an interest in the cultivation of this plant, the whole stock of seed they had obtained from their experiment, in the hope that so extensive a trial as would probably be thus made of the qualities of the plant would procure satisfactory results in reference to its further cultivation.

Pollen of Wheat.—Mr. Groom (Florist to the Queen), of Clapham Rise, Surrey, favoured the Society with the following communication:—"In reference to the effects I have observed from the use of bone saw-dust, of which a sample was presented to the Council at its last meeting, I feel no hesitation in saying that I have experienced the most beneficial results from its use. I have now tried it two seasons, and think, if possible, it has answered better this season than the last. It has produced a most luxuriant growth, with a beautiful dark healthy green, and a robustness of habit in the plants, equal to the summer growth; the plants also retain their lower leaves much longer, which is most essential with plants cultivated in pots. There is another point of importance, which is, that I do not think any injury will arise should the bone saw-dust be used in what may be termed excess, as I have tried a very large quantity in the soil without the plants appearing in any way affected, except in luxuriance of growth. There is also a most important result in an Agricultural point of view, which I have no doubt will be found to take place from the free use of the bone saw-dust, and that is, the increased fertilising power of the pollen, which will in a great measure do away with the light and defective ears in the grain crops, as I believe a great part of the failure arises from the want of vitality in the pollen."—It is perhaps worthy of remark, that Chemists have found in their analyses of the pollen of plants a predominance of those elementary principles of which bone is constituted; and that the purity of the bones employed as a manure, and the state of division into which they are reduced, has a considerable influence on the results obtained by their action is strikingly exemplified in the following statement of Mr. Miles, M.P., in reference to his experiments on the growth of Swedes, in the Society's Journal, vol. iii. page 426:—"A curious fact, however, came out in the application of different descriptions of bones used at the distance of 27 inches. In the one case, the bones were procured as they came from the kennels, with the usual quantity of animal matter adhering to them, and crushed at home; in the other, they were brought as refuse from a large button-manufactory, after having been thoroughly cleansed for the purpose of manufacture: the respective proceed was,—

Turnips on bones crushed at home . .	11 tons 8 cwts.
Do. do. from button-manufactory .	16 10

African Guano.—Mr. Forbes, of No. 2, Great St. Helen's, presented to the Society three specimens of guano collected on different islands in the Bay of Angra Peguena, on the western coast of Africa. "We have as yet," says Mr. Forbes, "no arrivals of this guano into the port of London, but some cargoes are daily expected, when I shall take the liberty of submitting fresh samples." Mr. Miles stated that the African guano had reached Bristol, and having received from Mr. Greening, of Nelson-street, in that city, the analysis of it, made by Professor Herepath, he had the pleasure of then submitting it to the inspection of the Council:—"I have analysed Mr. Greening's sample of African guano, and find that it is quite equal to that of Peru of good quality. The results are below; but I have not particularised those matters contained in it, which Agriculturists do not yet know the value of; all those which are known to be beneficial are:

Phosphate of lime	21 parts.
Soluble phosphates, with a little common salt	8
The elements of ammonia	11
Other matters, almost entirely organic . .	60
	100 parts.

(Signed) William Herepath."

Adjournment of Council.—Mr. Shelley gave notice, that he should move at the next monthly Council "That the Council at its rising on the first Wednesday in July next do adjourn over the period of the country meeting in that month, until the first Wednesday in August.—Mr. Colman announced his intention of presenting to the Society three American ploughs for trial at the South-

ampton meeting.—Mr. Murray, of Albemarle-street, presented a copy of the last Number of the "Quarterly Review," as containing a review of the Journal of the Society, under the head of "British Agriculture."—Mr. Longbottom, Secretary to the Royal Polytechnic Institution, presented a specimen of Holloway's Farmer's Compound (Manure); Mr. Donaldson a copy of his new edition of Bayldon on Rents and Tillages; and the Royal Society of Agriculture at Caen, a copy of their last notice of proceedings—for which, and the other presents and communications received, the best thanks of the Council were ordered. The Council then adjourned over the Easter Recess, to Wednesday the 17th of April.

Reviews.

An Account of Agriculture and Grazing in New South Wales, and of some of its most useful Natural Productions, &c. &c. By the late James Atkinson, Esq. Second Edition. Simpkin, Marshall, & Co.

THIS is a very neat little volume, full of most useful matter to the intending emigrant. It details information on all the subjects mentioned in its title-page, acquired during several years' residence in Australia, and must, therefore, be one of the best of the many works written for the benefit of emigrants to that continent.

Peruvian and Bolivian Guano; its Nature, Properties, and Results. J. Ridgway. Pp. 95.

THIS pamphlet appears to be a compilation from various sources, of experiments with guano on various crops, and at various rates of application per annum, many of them being comparative with other manures. It is conclusive as to the value of guano "as a cheap, powerful, enduring, and portable fertiliser, adapted more or less to every quality of land, and to almost every vegetable production;" and to all who are still doubtful on this subject, we recommend its perusal.

Miscellaneous.

The Curl in Potatoes is the effect of an enfeebled vegetation, arising from over-ripening of the tubers to be used as seed; and to the same cause is to be attributed the fact of tubers not vegetating at all when planted. Whenever Potatoes are to be used as seed, they require a mode of treatment very different from those destined to be used as food. The mode of treatment which I prefer above all others for seed Potatoes, is this: As soon as the tubers have acquired their full size, and the vegetable tissue in the roots has become perfect, the skins beginning to set,—that is, when the cuticle can still be removed by the pressure of the finger and thumb, so that it peels off,—at this stage of their growth they ought to be immediately taken up, and spread on the surface of the ground, fully exposed to the influence of the atmosphere; by which means, in a short time the tubers will be tanned green. This early lifting prevents the cellular tissue of the tubers from becoming gorged with solid matter, by cutting off the power of absorption from the roots; whilst, by the subsequent exposure of the tubers to the atmosphere, the juices combine with a larger proportion of oxygen, which, in the light, enters into combination with the colouring matter of these roots, not only changing their colour from white to green, but also giving to them an increased vitality, as is seen in germination when oxygen enters into combination with the juices, and carbonic acid is parted with; by which means the starch in the tubers, instead of becoming fixed, is retained in the transition state; so that when those conditions calculated to excite vegetation are present, the organizable matter in the tuber immediately excites the buds or eyes to vigorous growth. Similar results, to a certain extent, may be obtained by very late planting; so that when the process of vegetation is stopped by the autumnal frosts, the maturation of the secretions of the plant may be somewhat in the transition state; that is, they may not have acquired the solidity I have alluded to. There are, I have observed, some soils calculated to produce the same effects. Peaty soils, and reclaimed bog, and morasses, are found to produce an imperfect vegetation, as is observable in the cereal or grain plants, which, when reared on these soils, are greatly deficient in that which constitutes its value as food, namely, starch. In like manner the Potato, when grown upon these soils, is always found soft and spungy, and little fitted for table; whilst they are found eminently fitted for planting, and that for the reasons already stated. Those who cannot, or will not, take the trouble to save their seed Potatoes by the first-mentioned method, ought assuredly to purchase their stock for planting annually from some of their neighbours who have such soils upon which they can be reared. The manner of keeping the tubers over the winter must have due attention. It is of the utmost importance that the chance of becoming in the least degree heated in the pits be avoided; and this is easily accomplished by storing them in pits never more than three feet wide, and ten inches to one foot deep. They will have little chance of acquiring heat in a pit of these dimensions, but the narrower the better, and not too thickly covered with earth; the less of this the better, if sufficient to prevent frost from reaching them. When taken out to be used for planting, and cut, the sets should never be allowed to lie in a heap, as is frequently done, but ought to be spread thinly in an airy place for a few days previous to planting, that the cut parts may be dried up a little, or healed, as it is termed. Many of our bogs might be most profitably employed in the growth of Potatoes for seed, which would yield good crops. It must be apparent that the finer and more valuable the variety is for food, so much greater is the risk of losing the crop. This has led, in many instances, to people being induced to plant those sorts which, from their great inferiority to those mentioned, are sure to produce a crop, while, by attending to the proper mode of treatment, heavy crops of the very best sorts may be obtained with certainty. Much has of late been said concerning raising new varieties from seed, and it is from this source that all our esteemed varieties are obtained; but when once obtained, unless they are preserved in vigour by those means which I have now pointed out, they will in a few years become so enfeebled, that they will appear in the same condition as the finer varieties now in cultivation, all of which may be effectually restored by proper treatment.—*Mr. Deans, in the Kelso Chronicle.*

Notices to Correspondents.

BARN FLOOR.—*A Subscriber*—Will find wood the best and most economical barn floor. We have heard of india rubber as material for pavement, and in one instance for the flooring of a stable, but never as material for a barn floor.

BONES AND SULPHURIC ACID.—*J. W.*—Mr. Lawes's plan in a former Number will succeed, but it assumes the bones to be ground small. This must be done at the mill. The refuse of the button factories can be got as cheap as ordinary bone-dust, and will answer your purpose better. Muriatic acid is a little dearer than sulphuric. See Manure Market.

BOOKS.—*Rural Chemistry.*—"Blaker's Essay on Small Farms." Apply to the booksellers.

COW CABBAGE.—*Ay Ay.*—The Drum-Head, or what is known in Devonshire as the South Ham are good varieties. Sow in August in beds, and plant out in the field early in spring two feet apart, or sow very early in spring and plant out in June. The one will be ready early, and the other late in autumn. It is a good plan to plant between these late Cow Cabbage some early plants of a kind which will be ready to cut before the others want their room.

CULTIVATION OF POOR LAND.—*Subscriber.*—Thanks for your suggestion.

ELF-RINGS.—*R. T.*—We shall be glad to see your explanation of them.

FOREIGN OILCAKE.—*Notts.*—The price is a pretty fair indication of its value, comparatively with British. We rather prefer the foreign. Why will your land not grow Tares? "Strong Wheat land" is just the thing for them. They are the best green food for horses. Try Italian Rye-grass with Clover for this purpose.

FOOD OF PLANTS.—*Rural Chemist.*—Please to excuse a further delay in the answer to your question.

GRASSES.—*J. L.*—Lawson recommends as seed per acre for permanent Grass on deep mossy ground, Agrostis stolonifera, 2 lbs.; Alopecurus pratensis, 2 lbs.; Festuca duriuscula, 2 lbs.; Lolium perenne, 6 lbs.; L. italicum, 3 lbs.; Phleum pratense, 2½ lbs.; Poa trivialis, 2½ lbs.; Trifolium repens, 6 lbs.; Lotus major, 1½ lbs.; Rye, one bushel. And for 2 year Grass on medium light soils, Lolium perenne, 18 lbs.; Trifolium pratense, 6 lbs.; T. repens, 4 lbs.; Medicago lupulina, 2 lbs.

GUANO.—*G.*—It should be mixed with the mould. Plough it in before sowing the Oats.——*Subscriber.*—Gypsum may be advantageously mixed with it.—— *Subscriber.*—The time this manure will last depends upon the quantity per acre applied, and the quantity of its different ingredients removed annually in the crop. Its effects will generally be apparent more than one season.

MANURES.—*N.*—The advice you ask for cannot be given confidently without a knowledge of your soil, &c. It may be stated, however, that gypsum has been found to act very beneficially on Clover swards—that nitrates of potass and soda have often increased the growth of Grass to which they have been applied—but that the application most likely to succeed would be guano treated as Mr. Mitchell recommended in a previous paper; for *that*, being a compound manure, is most likely to contain the substance for the want of which your pasture is failing. Apply about 3 cwt. per acre, broadcast, in wet weather.

NEAPOLITAN PIGS.—*A. H.* is informed that a boar and sow, imported from Naples, are for sale at Welcombe House, near Stratford-on-Avon.

POTATOES.—*Subscriber.*—Take care not to bring the clay to the top; drain your land, and subsoil plough or trench, and after thus opening up the subsoil for some years, you may begin cautiously to bring it to the surface. See leading article.

MISCELLANEOUS.—Will *J. M. C. T.* be kind enough to favour us with his name and address?

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, MONDAY, April 8.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	6	to 3s	10	Best Downs & Half-breds	4s	0 to 4s 4
Best Short Horns	3	2	3	6	do. shorn	3	6 3 10
Second quality Beasts	2	10	3	2	Best Long-wools	3	8 4 0
Calves	4	4	4	10	do. shorn	3	4 3 8
Lambs, small	6	0	6	8	Ewes and second quality	3	4 3 8
— large	5	4	6	0	do. shorn	3	0 3 4
Pigs	3	4	4	0			

Beasts, 2407; Sheep and Lambs, 20,910; Calves, 62; Pigs, 240.

We have to-day a very limited supply, yet fully adequate to meet the demand, as this is a kind of holiday market—indeed, its being Easter Monday accounts for the smallness of numbers: it was anticipated that many less than usual would be wanted, and so it has proved; still, the effect has been to give a slight impulse to the trade, which is more cheerful, and in some things there is a little improvement in price. In Beef we can discover hardly a quotable difference from last week, although in the best qualities there is a slight average advance—in some few instances very superior have, indeed, realised 4s per 8 lbs. A few of the second class Beasts remain unsold. The best Down Sheep are making fully 2d per 8 lbs more than this day week, and the selling kind of Shorn Longwools are more in demand, at better prices. Lamb is not a very active trade, and suffers a decline from Friday's quotations. Veal trade is brisker, at a small advance. Pork is active.

FRIDAY, April 12.

The shortness of supply on Monday, together with the small arrivals at the dead markets since that day, has thrown a little life into our trade. There is no alteration whatever in the price of Beef, but Mutton is a shade better. Some of the very best old Downs in the wool are making 4s 6d, but this is not generally realised; the best Longwools, about 4s 2d; Downs without the wool make rather over 3s 10d, and the most selling shorn Longwools rather over 3s 8d; other qualities in the same ratio. Lamb remains the same as Monday—the morning being rather cold, trade for it is not very brisk. Some few superior Calves make 5s, but the more general price is 4s 10d per 8 lbs. Pork is steady.

Beasts, 679; Sheep and Lambs, 6990; Calves, 153; Pigs, 294.

41, West Smithfield.

HAY.—Per Load of 36 Trusses.

KINGSFORD AND LAY.

COVENT GARDEN, APRIL 12.—In consequence of the continued fine weather most articles begin to improve rapidly in quality, and trade is getting better. Pines have advanced a little in price; they consist chiefly of Queens, which are of good quality. A few hothouse Grapes are in the Market; they are selling at from 30s. to 35s. per lb.; Portugals are sufficient for the demand. Apples are selling at nearly the same prices as last week, as are also Pears. Oranges are offered at from 4s. to 16s. per dozen. Lemons are sufficient for the demand. Chesnuts are becoming scarce, and are a little advanced in price. Spanish Nuts are scarce. The supply of Vegetables in general is increasing. Broccoli is good; it is selling at from 6d. to 2s. per bundle. Greens are still sufficient for the demand; but they are getting scarcer. Carrots and Turnips are good and plentiful, and Seakale and Asparagus are abundant; the latter is a little reduced in price. French Beans bring from 1s. 6d. to 2s. 6d. per 100. Rhubarb is plentiful. Cucumbers are slightly reduced in price, as are also Strawberries: the latter are becoming rather more plentiful. Frame Potatoes are nearly the same as last week. Among Cut Flowers we noticed Erica rubra calyx, E. andromedæflora, Gnidia pinifolia, Nemophila discoidalis, N. insignis, Heliotropes, Lily of the Valley, Cinerarias, Pelargoniums, Camellias, Azaleas, Gardenias, Fuchsias, and Roses.

KINGSFORD AND LAY.

POTATOES.—SOUTHWARK WATERSIDE, April 8.

THE continued fine weather during the past week has forced vegetation rapidly; the Town markets have been abundantly supplied with most articles. Hot weather always causes a serious depression in our Market. Owing to the contrary winds, the supply since our last has been small; but, in consequence of the continuance of hot weather, some further reductions were submitted to, and the trade was languid, at the following prices:—

York Reds - - -	80s	to 90s	Essex and Sussex Blues	70s	to 75s
Perth - - - - -	75	80	Wisbeach Kidneys -	—	80
Early Devons - - -	—	—	— Blues -	65	70
Late Devons - - -	80	85	— Whites -	60	65
Cornwall - - - -	—	—	Jersey and Guernsey Blues	—	75
Kent and Essex Whites -	60s	70	Prince Regents -	80	90
— — Kidneys -	80	85	Shaws for plants -	65	75

MARK FOTHERGILL.

DISEASED AND HEALTHY LIVES ASSURED.

MEDICAL, INVALID, and GENERAL LIFE OFFICE, 25, Pall Mall, London.—This Office is provided with very accurately-constructed Tables, by which it can Assure Diseased Lives on Equitable Terms. Increased Annuities granted on unsound Lives, the amount varying with the particular disease. Members of Consumptive Families Assured at Equitable Rates.

E. G. P. NEISON, Actuary.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, WATERLOO-PLACE, LONDON.

Directors.

The Chisholm, *Chairman.* | Wm. Morley, Esq., *Deputy-Chairman.*
John Brightman, Esq. | James John Kinloch, Esq.
Francis Brodigan, Esq. | Henry Lawson, Esq.
James William Deacon, Esq. | Robert Power, Esq.
Jonathan Duncan Dow, Esq. | The Reverend F. W. Johnson Vickery, A.M.
Alexander Robert Irvine, Esq. |
John Inglis Jerdein, Esq. |

Auditors.

C. R. Rule, Esq.—T. C. Simmons, Esq.—George Thomas, Esq.
Physician.—John Clendinning, M.D., 16, Wimpole-street.
Solicitor.—Walter Prideaux, Esq., Goldsmiths' Hall.
Bankers.—Union Bank of London.

ADVANTAGES OF THIS INSTITUTION.

The whole of the Profits divided ANNUALLY among the Holders of Policies on which five Annual Premiums shall have been paid.

Credit given for half the amount of the first five Annual Premiums, by which means Assurances may be effected and loans for short periods secured with the least possible present outlay; and after payment of the arrears, the Policy-holder will become entitled to participate in the entire profits of this Institution, precisely in the same manner as if he had paid the whole amount of his Premiums in advance in the usual way.

Thus, for example—a person in the 25th year of his age, instead of paying 2*l.* 6*s.* per annum for an Assurance of 100*l.*, would be required to pay 1*l.* 3*s.* only during the first five years, when, on payment of the arrears of Premium, amounting to 6*l.* 15*s.*, his share of the profits would be such as to reduce his future Annual Premiums to very little more than the half Premium of 1*l.* 3*s.* originally paid by him. The GREAT BRITAIN is the only Mutual Assurance Society in which this very great accommodation is given to the Assured.

Credit allowed for the whole of the first five Annual Premiums on satisfactory security being given for the payment of the same at the expiration of five years.

Transfers of Policies effected and registered (without charge) at the Office.

Claims on Policies not subject to be litigated or disputed, except with the sanction, in each case, of a General Meeting of the Assured, to be especially convened on the occasion.

Holders of Policies of 1000*l.* entitled (after payment of five Annual Premiums), to attend and vote at all General Meetings of the Assured, who will have the superintendence and control of the funds and affairs of the Society.

Full particulars are detailed in the Prospectus, which, with every requisite information, may be obtained by application to

A. R. IRVINE, *Managing Director.*

ROYAL FARMERS' AND GENERAL FIRE, LIFE, AND HAIL-STORM INSURANCE INSTITUTION.

Empowered by Special Act of Parliament.—Capital, £500,000. Offices, Strand, London.

HONORARY DIRECTORS.

Duke of Rutland, K.G. | Earl Ducie.
Duke of Bedford. | Viscount Torrington.
Earl of Stamford and Warrington. | Viscount Campden.
Earl of Stair. | Lord Rayleigh.
Earl Howe. | Lord Feversham.
Earl of Stradbroke. | Lord Stanley, M.P.

And Seventy-six other Members of Parliament and Gentlemen.

HAIL-STORM DEPARTMENT.

ADVANTAGES OF INSURING IN THIS OFFICE:—

An actually subscribed Capital of £500,000, secured by 1963 Shareholders, whose names and addresses are enrolled according to Act of Parliament.

Insurances effected in one sum.

Division of profits amongst the Insured every third year.

All losses, whether total or partial, paid in full, as soon after the occurrence as the valuation can be completed.

No Average Clause; so that the sufferer will be certain of receiving the full amount of his loss, to be settled as in the case of loss by fire.

Premium Sixpence per acre for Wheat, Barley, and Peas; Fourpence for Oats, Beans, Turnips, and Potatoes.

Glass in hothouses, greenhouses, or private houses, 20*s.* p. cent.

The surplus profits, after paying an annual dividend of 4*l.* per cent. to the shareholders, and providing for a reserved fund, will be divided every *third* year between the shareholders and the insured.

The Directors of this Institution by no means wish to interfere with any other Office; but, as the General Hail-storm Insurance Institution, Norwich, has announced rates lower even than those charged by this Institution last year, they do not feel that they are going too far in calling public attention to the comparative positions of both Offices.

Royal Farmers' and General Fire, Life, and Hail-storm Insurance Company.	*General Hail-storm Insurance Company, Norwich.* (Not the Norwich Union Insurance Office.)
Empowered by special Act of Parliament.	No Act of Parliament.
Subscribed capital, 500,000*l.*	Nominal capital, 100,000*l.*
Number of shareholders registered, 1963, with names and addresses, according to Act of Parliament.	Number of shareholders, not announced. Query, what number, their names and addresses?
Four years' experience.	No experience.
Rates based upon the above-mentioned experience, but, if found too high, A RETURN WILL BE MADE EVERY THIRD YEAR.	Rates not founded on experience, and too low to meet losses on an average of seasons.
Full liability to the extent of 500,000*l.*	Limited liability, confined to shares taken, however few.
Power given by the Act of Parliament by which parties insured may sue the Company, in the name of the Managing Director, Secretary, or any one of the Directors.	No power to sue the Company in the name of the Managing Director, Secretary, or any one of the Directors; and, as the Shareholders are unknown, the insurers may have a difficulty in recovering their losses.
Shareholders, if sued, can recover contributions from their co-Shareholders.	Purchasers of Shares are individually liable to the 100,000*l.*, and if sued, have no power to recover contributions from their co-Shareholders. ANY CLAUSE INTRODUCED INTO A POLICY TO LIMIT LIABILITY IS INVALID unless the Company is empowered by Act of Parliament, giving Shareholders the power of obtaining contributions from their co-Shareholders.

Detailed Prospectuses may be obtained at the office, or will be forwarded, post free, upon application.

The usual commission to Solicitors.

Agents are appointed in all the principal Towns in the Kingdom.

W. SHAW, Managing Director.

PROVIDENT LIFE OFFICE, 50 REGENT STREET, FEB. 15, 1844.

BONUSES DECLARED, 529,306*l.* 17*s.* 7*d.*

NOTICE is hereby given, that all Persons who hold Policies in this Office, bearing date prior to the year 1834, may receive the present value of the Bonuses which have been added to their Policies, upon application at the Head Office, or to the Agents through whom the Policies were issued.

GEORGE BEAUMONT, Actuary.

NATIONAL MERCANTILE LIFE ASSURANCE SOCIETY, ARTHUR-STREET WEST, LONDON BRIDGE. (Established in 1837.)

Directors.

Chairman.—Robert Currey, Esq.

Edward Baker, Esq. | Thomas Bax, Esq.
Jasper Capper, Esq. | Joseph Cooper, Esq.
Thomas Dakeyne, Esq. | Russell Jeffrey, Esq.
Giles Redmayne, Esq. | William R. Spicer, Esq.
James Spicer, Esq. | Joseph Sterry, jun., Esq.
Henry Sterry, Esq. | Robert Wilcoxon, Esq.

Bankers.—Messrs. Prescott, Grote, and Co.

ADVANTAGES.

A BONUS of two-thirds of the Profits allotted to the Assured.

LOWER RATES OF PREMIUM charged for Assurances without profits.

PREMIUMS payable Annually, Half-yearly, or Quarterly.

ASSURANCES OF EVERY DESCRIPTION may be effected. Among others, the important one, *originated by this Society*, of securing a sum to the Assured himself on his attaining any given age, or to his family *in the event of his earlier death.*

A POCKET DIARY containing detailed particulars, may be had on application at the Office, or of the Society's agents.

JENKIN JONES, Actuary and Secretary.

LONDON, EDINBURGH, and DUBLIN LIFE ASSURANCE COMPANY, No. 3, Charlotte-row, Mansion House; and 18, Chancery-lane, London.

This is the only Company who are bound by their deed of constitution not to dispute any Policy, unless they can prove that it was obtained by fraudulent misrepresentation; and nothing but fraud proved to have been committed against them can vitiate a Policy granted by this Company.

This is the only Company from whom the assured on the mutual principle receive the whole of the mutual accumulations, and also a guarantee from the Shareholders for the sums assured.

This is the only Company who bind themselves to pay the sums in the Policies, although the debts for which they were effected shall have been liquidated before the claims arise.

This is almost the only Company who grant in favour of creditors *whole-world Policies*, whereby the debt is secured, although the debtor should go beyond the limits of Europe.

By the half-premium plan only one-half of the premiums for the first seven years is required, the other half being payable at the convenience of the assured; thus allowing a Policy to be continued for seven years at one-half of the usual rate, or to be dropped at one-half of the usual sacrifice.

ALEX. ROBERTSON, Manager.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c., &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 130, Fleet-street. A Prospectus may be had detailing the prices, &c.

E. WEEKS, Sen., after a series of years' practice and great study in building Hothouses, Greenhouses, and Conservatories, combining utility with elegance, and as a practical man in Forcing, begs to inform the Nobility, Gentry, and Public, that he has for inspection a quantity of the above with all his new inventions for Heating the same on superior principles. Boilers and Apparatus on revolving, circulating, and ventilating systems; Bath and Office-stoves, &c., &c., superior to anything yet seen for steaming and circulating of heated water, at his Factory, Hortolan-Place, King's-Road, Chelsea.

GUANO ON SALE BY THE IMPORTERS,

JOHN BOYD & Co.,
Wellington Chambers, London-bridge, Borough.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS,

ANTONY GIBBS AND SONS, LONDON;
WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, April 12, 1844.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7*s.* per cwt. Phosphate of Potash, 16*s.* per cwt.
,, Soda 12*s.* ,,
,, Magnesia 9*s.* ,,
,, Ammonia 1*s.* per lb.

*** Super-phosphate of Lime in a concentrated form may also be procured of Messrs. WARNER, 28, Cornhill, and other Seedsmen, in 7 lb. packets, price 1*s.*

MANURES.

BOAST AND Co.'s PATENT INORGANIC MANURES. These strong and productive manures have already proved their superiority over all others yet adopted. It is now thoroughly understood and acknowledged by intelligent agriculturists that each plant requires a distinct manure, and it is upon this perfectly scientific principle that these manures are prepared, being formed so as to supply all the substances taken from the soil by each particular crop. They are immeasurably more efficacious, far more economical than all others, and possess the great advantage of being easily applied to the land.

Prospectuses, with full particulars, may be obtained; or will be forwarded by post on application at the Manufactory, Bow, Middlesex.

*** By the use of these Manures, any land may be rendered fertile. Wheat, &c. may be grown on the same land every year with immense advantage to the farmer, and without injury to the soil; whilst all the other crops are greatly increased.

GUANO, superior to the foreign, at a reduced price.

Manures prepared expressly for Gardeners and Florists.

THE URATE of the LONDON MANURE COMPANY, 5*l.* per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

DR. HALLETT'S LIQUID FERTILISER.—The beauty of Flowers, with their power of perfecting their Seeds, and the flavour and size of Fruits and Vegetables, must ever depend upon the food supplied to the plants producing them, and these a very extensive series of trials on various soils has shown, may be secured by the use of Dr. HALLETT'S CONCENTRATED LIQUID FERTILISER, which contains all the essential ingredients of the best foreign Guano, but not to be found in the Atlantic Ocean. Sold by Messrs. WARNERS, 28, Cornhill; Messrs. WINSTANLEY, 7, Poultry; Messrs. HURST and M'MULLEN, 6, Leadenhall-street; and all respectable Chemists and Seedsmen; with directions, in stone quarts, at 1*s.* 6*d.* each, and in bottles containing as much as six of these, at 7*s.* 6*d.* The quart requires 32 gallons of water to reduce it for use, for watering soils and growing bulbs in.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition, have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2*s.* 6*d.*, quarts, 4*s.* 6*d.* each. One pint is sufficient to coat four Frames twice over, each Frame to be 5ft. by 3ft. 3in., or thereabouts. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsmen, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. BUTLER and MUCKLEY, Covent Garden, where a sample of prepared calico may be seen; Mr. WATKINSON, Market-place, Manchester; PAGE and SON, Southampton; T. and C. WHALLEY, Nurserymen, Liverpool.

Agents wanted for London and the country.

WOODLANDS NURSERY, MARESFIELD, near Uckfield, Sussex.

WILLIAM WOOD AND SON have much pleasure in acquainting their numerous Patrons and Friends that they have been appointed Agents for the sale of that most invaluable article—WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, samples of which may be seen, and the composition in use, at WOOD and SON'S Nursery. Sold in bottles, with ample directions for use, pints 2*s.* 6*d.*, quarts 4*s.* 6*d.* each. Discount to the Trade.

THE NEW CHEMICAL MANURE.

HUMPHREYS'S FARMERS' COMPOUND, *stronger than Guano, and without its caustic rankness.* Samples on view at the Royal Polytechnic Institution. On Sale with the following Agents:—THOMAS GIBBS and Co., by appointment Seedsmen to the Royal Agricultural Society of England—corner of Half Moon-street, Piccadilly; COTTAM and HALLEN, Agricultural Repository, Winslow-street, Oxford-street; BURCHFIELD, Smithfield; BATT and RUTLEY, 412, Strand; CLARK, Bishopsgate-street; CHARLWOOD, Tavistock-row, Covent Garden; FLANAGAN and SON, Mansion-house-street; BUTLER, Covent Garden; FOTHERGILL, 40, Upper Thames-street; HURST and MCMULLEN, Leadenhall-street; LOCKHART, Cheapside; WILLIAM and JOHN NOBLE, Fleet-street; W. J. NUTTING, Cheapside; WEDLAKE, Fenchurch-street; SAMUEL HOWARD, 38, Mark-lane; WHITE, Phœnix Wharf, Blackfriars; ALLEN, Shrewsbury; COPERMAN and Co., Wells, Norfolk; DICKSON and Co., Edinburgh; T. S. KING, Rochester; W. F. MOLESWORTH, Banbury; W. MADDOCK, Tunbridge Wells; W. E. RENDLE, Plymouth; THOMSON and Co., Macduff, near Banff; THOMAS WATKINSON, Market-place, Manchester. Price 12*s.* per cwt.—DAVY, MACKMURDO, and Co., Manufacturing Chemists, 100, Upper Thames-street, London.

IMPORTANT TO AGRICULTURISTS AND OTHERS.

ANALYSES OF SOILS, MANURES, &c. are conducted by MR. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, A., Hawley Road, Kentish Town.

N.B. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

HENRY HUNT'S PATENT GARDEN POTS and STANDS, for effecting improved Drainage and Draught of Air. Patronised by Royalty and 30 Metropolitan and Provincial Horticultural Societies. Wholesale and Retail Depôt, 29, Queen's-row, Pimlico. The opinions of the Horticultural and Scientific Press, with priced Cards, forwarded on application, post-paid. Nurserymen in provincial towns appointed Agents.

MOST IMPORTANT TO FARMERS AND GRAZIERS.

GIBBONS' DISINFECTING OINTMENT, a most effectual and perfect cure for Epidemic and Foot-rot in Sheep; also for Epidemic and Foal in Cows' Feet, and for the Grease and Thrush in Horses; prepared only by HENRY GIBBONS, Agricultural Chemist, Wolverhampton.

This Ointment effectually destroys the American grub on Fruit-trees. Sold by all respectable Druggists in Town and Country, in packets at 2s. 6d. each. Mr. William Bailey, Manufacturing Chemist, North Street, Wolverhampton, is appointed Sole Wholesale and Shipping Agent.

LEVEL.—This Instrument, the invention of a Gentleman extensively engaged in Draining, is confidently recommended for its simplicity and cheapness; it requires only one person to use it, and gives the rise and fall in land as well as the level, and is also adapted for giving a uniform fall to drains. Each Level is packed in a case 18 inches by 3. Price, 2l. Direct to W. B. WEBSTER, Hounsdown, near Southampton.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

BEE-HIVES.—GEORGE NEIGHBOUR & SON beg to inform their Apiarian friends that they have prepared for the season a large supply of "Nutt's Patent Bee-hives" (for the sale of which they are the only authorised agents), in which are embodied all the recent improvements. Their selection now comprehends most varieties in general use at the present time, including the "Single Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with glasses, &c., from either of which the produce may be taken at any time of the gathering season, without destroying the Bees.

G. N. & SON have also Glass Hives, and other articles connected with Bee management, a catalogue of which, with drawings, may be obtained. Letters of inquiry must have postage stamps inclosed.—Apiarian Depot and Honey Warehouse, 127, High Holborn, London.

NUTT ON BEES, Fifth Edition, now Published.

SILVER PLATED DISH COVERS. — A. B. SAVORY and SONS, Manufacturing Silversmiths, 14, Cornhill, opposite the Bank of England, submit for choice in their Plate-rooms, many patterns of SILVER PLATED DISH COVERS, of Sheffield manufacture, from 15 to 20 guineas the set, viz.:—

Double Dome Pattern.	Size.	£	s.	d.	*The Melon Pattern.*	Size.	£	s.	d.
1 Pltd. Dish-cover,	20 in.	5	13	6	1 Pltd. Dish-cover,	20 in.	5	17	0
1 ,, Dish-cover,	18 in.	4	7	6	1 ,, Dish-cover,	16 in.	4	14	6
2 ,, Dish-covers,	14 in.	5	12	0	2 ,, Dish-covers,	14 in.	6	6	0
Per Set.....		£15	13	0	Per Set.....		£16	17	6

The above have silver handles and mountings, and silver shields for engraving the crest or coat of arms. A price current, illustrated by drawings, and containing every information relative to the purchase of silver or Sheffield plate, may be had on application, or will be sent into the country, free of postage, in answer to a paid letter.

ON SATURDAY NEXT, WILL BE PUBLISHED, PRICE SIXPENCE, STAMPED TO GO FREE BY POST,

The FIRST NUMBER of

The Railway Chronicle.

JOURNAL OF ENGINEERING IMPROVEMENTS, MECHANICAL INVENTIONS, PUBLIC WORKS, &c.

THERE HAS BEEN CREATED within the last ten years a PRODUCTIVE PROPERTY IN RAILWAYS amounting to more than SIXTY MILLIONS sterling, with a REVENUE of nearly SIX MILLIONS PER ANNUM. This addition to the wealth and resources of England has been produced by the Investment of the funds of nearly Fifty Thousand Individuals, who form the Railway Constituency of Great Britain. It affords employment to a great body of our Workmen, tends to the development of our industrial Capabilities, and is a boon to the whole travelling Population.

It is strongly felt that Railway property, involving interests so extensive, should not be exposed to the injurious effects which the want of sound information and the circulation of erroneous statements for party purposes so constantly produce; and it has appeared, to those most capable of judging, that the mutual interests of the Proprietary, the Managers, and the Railway Executive, and the Public interests with which they are identified, have as yet found *no* organ in which they can be fairly discussed and satisfactorily adjusted. The Railway Chronicle has been projected to supply this deficiency, by THE ESTABLISHMENT OF AN AUTHENTIC AND IMPARTIAL MEDIUM OF COMMUNICATION BETWEEN ALL THE MEMBERS OF THE GREAT RAILWAY COMMUNITY; having especially in view the free communication of useful information, the promotion of the common interests and the general circulation of sound intelligence in all that relates to Railway property.

The Conductors of the Railway Chronicle are men of practical experience, who possess peculiar facilities for obtaining the earliest information, and who will use their anxious endeavours to advance, in every way, the great interests of Railway property, avoiding all indulgence of personal feeling, the expression of party prejudice, or the advancement of exclusive interests:—they desire, in short, to furnish an unbiassed Chronicle of facts, and a fair arena for the discussion of important opinions and principles.

The Railway Chronicle will contain the earliest and most authentic information on the following subjects:—

THE CONDITION AND PROSPECTS OF RAILWAYS NOW IN USE.
POSITION, PROGRESS, AND VALUE OF FOREIGN RAILWAYS.
PROGRESS OF RAILWAYS IN EXECUTION.
PROJECTED NEW RAILWAYS.
THE TRAFFIC AND REVENUE OF RAILWAYS.
THE ECONOMY OF WORKING AND EXPENDITURE.
THE VALUE OF SHARES.
PAYMENT OF CALLS, DIVIDENDS, AND DEBENTURES.
THE PROCEEDINGS AT RAILWAY MEETINGS, WITH THE DOCUMENTS LAID BEFORE SUCH MEETINGS.
WEEKLY REPORTS ON THE MONEY AND SHARE MARKETS.
THE PROCEEDINGS OF THE BOARD OF TRADE AND OTHER PUBLIC OR MUNICIPAL BODIES, SO FAR AS THEY AFFECT THE INTERESTS OF RAILWAY PROPERTY.
PARLIAMENTARY RAILWAY PROCEEDINGS.
RAILWAY LEGAL INFORMATION.
CONTRACTS FOR EXECUTION OF WORK.
STATE OF THE IRON TRADE.
ENGINEERING WORKS OF MERIT ON RAILWAYS AT HOME AND ABROAD.
ENGINEERING IMPROVEMENTS ON RAILWAYS AT HOME AND ABROAD.
MECHANICAL INVENTIONS RELATING TO RAILWAYS AT HOME AND ABROAD, ILLUSTRATED, WHEN REQUISITE, BY WOOD-CUTS.
LOCOMOTIVE IMPROVEMENTS AND INVENTIONS AT HOME AND ABROAD.
REPORTS OF THE SCIENTIFIC SOCIETIES, WHENEVER ANY SUBJECTS AFFECTING RAILWAYS ARE DISCUSSED.
RAILWAY LITERATURE.
RAILWAY PATENTS.

To elucidate which, Illustrative Maps and Engravings will be given, when necessary.

Arrangements have been made for the purpose of supplying in the Railway Chronicle the earliest information concerning the FRENCH RAILWAYS (*the figures being in English money*), in which so much British capital is now invested, and the other Railways on the Continent which are in progress or in prospect. Intelligence will leave Paris every week in time for insertion in the Railway Chronicle, which will thus contain the transactions in the Paris Railway Stocks, and receipts of the various lines up to the latest hour, and furnish the earliest notice of whatever may affect the British holder.

Weekly Reports from the London, Liverpool, Manchester, and Northern Share Markets will afford the Capitalist the means of judging of the condition of Railway investments.

Another peculiar feature of the Railway Chronicle is to consist in a series of papers on each of the Great British Railways—in which the Past History, Present Condition, and Future Prospects of every Railway will be concisely developed. It is hardly to be presumed, that the great number of persons who have of late years begun to interest themselves in Railway Property, can have had the leisure and opportunity necessary to understand the peculiar circumstances and character of each individual Railway, so as to estimate properly the relative value and prospective profit of these investments. This information will be given in the successive Numbers of the Railway Chronicle. For those who are now becoming subscribers for the first time to a Railway Paper, this feature is important, as it will enable them rapidly to obtain an acquaintance with the whole of the existing lines.

TO CAPITALISTS, BANKERS, SOLICITORS, STOCK-BROKERS, INSURANCE COMPANIES, and all who hold Money for investment, the Railway Chronicle will furnish such sound unprejudiced information as shall enable them at once to make a judicious choice for the investment of funds at their disposal.

TO ENGINEERS, the Railway Chronicle will afford information on all points of Practical Engineering that may tend to the advancement of the profession, and to the perfection of that Railway communication which their talents have placed in its present admirable condition, and which it remains for their skill to render more available to the Public, and therefore more beneficial to the Shareholder. Through this channel of intercommunication every intelligent person will have an opportunity of contributing to the common stock of knowledge, and consequently to the general welfare.

TO CONTRACTORS, MANUFACTURERS, INVENTORS, and PRACTICAL ENGINEERS and MECHANICS, the Railway Chronicle will afford the means of bringing before the Influential Part of the Railway Proprietary, such Inventions, Discoveries, Practical Works, Mechanical Improvements and Articles of Manufacture, as they may desire to introduce into Railway employment; and it will afford the means of ascertaining where their practical assistance can be required either on lines projected or in execution. Thus the columns of the Railway Chronicle will open a market for the labour of the Contractor, the inventions of the Mechanist, and the commodities of the Manufacturing Engineer.

The Railway Chronicle

Will be published EVERY SATURDAY, in time for the Morning Mails.

☞ Orders received by all Newsmen.

Office for Advertisements and Communications, 14, *Wellington-street North, Strand, London.*

WORKS

ON AGRICULTURE, LAND-SURVEYING, NATURAL HISTORY, & SCIENCE.

PRINTED FOR

LONGMAN, BROWN, GREEN, & LONGMANS.

AN ENCYCLOPÆDIA of AGRICULTURE; comprising its History in all Countries, the Principles on which Agricultural Operations depend, and their Application to Great Britain and similar Climates. By J. C. LOUDON, F.L.S. Fourth Edition, 8vo, nearly 1,300 Woodcuts, 2l. 10s.

THE FARMER'S ENCYCLOPÆDIA, and DICTIONARY of RURAL AFFAIRS; embracing all the recent Discoveries in Agricultural Chemistry; adapted to the comprehension of unscientific readers. By CUTHBERT W. JOHNSON, Esq., F.R.S. 8vo, Woodcuts of the best and most improved Agricultural Implements, 2l. 10s.

"Cuthbert Johnson's 'Farmer's Encyclopædia' is one of the best books of its class."—*Gardeners' Chronicle.*

ELEMENTS of PRACTICAL AGRICULTURE. By DAVID LOW, Esq., F.R.S.E., Prof. of Agriculture in the University of Edinburgh. Fourth Edition, greatly improved. 8vo, 200 woodcuts, 21s.

'Low's Elements of Practical Agriculture,' is the best work on Farming in our language."—*Gardeners' Chronicle.*

The BREEDS of the BRITISH DOMESTICATED ANIMALS DELINEATED and DESCRIBED. By DAVID LOW, Esq., F.R.S.E., Prof. of Agriculture in the University of Edinburgh. 2 vols. 4to, with 56 coloured plates, 16l. 16s.

AN INQUIRY into the NATURE of the SIMPLE BODIES OF CHEMISTRY. By DAVID LOW, Esq., F.R.S.E., Professor of Agriculture in the University of Edinburgh. 8vo, 6s.

THE APPLICATION of GEOLOGY to AGRICULTURE, and to the Improvement and Valuation of Land: with the Nature and Properties of Soils, and the Principles of Cultivation. By N. WHITLEY, Land Surveyor. 8vo, 7s. 6d.

THE ART of VALUING RENTS and TILLAGES, And the Tenant's Right of Entering and Quitting Farms, explained by several Specimens of Valuations; and Remarks on the Cultivation pursued on Soils in different Situations. Adapted to the Use of Landlords, Land-Agents, Appraisers, Farmers, and Tenants. By J. S. BAYLDON. 6th Edition, corrected and revised, by JOHN DONALDSON, Land-steward, Author of "A Treatise on Manures and Grasses." 8vo. 10s. 6d.

SIR HUMPHRY DAVY'S AGRICULTURAL CHEMISTRY. With Notes by DR. JOHN DAVY. 6th Edition, 8vo, 10 Plates, 15s.

CROCKER'S ELEMENTS of LAND-SURVEYING. Fifth Edition, corrected throughout, and considerably improved and modernised, by T. G. BUNT, Land Surveyor, Bristol. To which are added, TABLES OF SIX-FIGURE LOGARITHMS, &c., superintended by RICHARD FARLEY, of the Nautical Almanac Establishment. Post 8vo, 12s.

A COMPLETE TREATISE on PRACTICAL LAND SURVEYING. By A. NESBIT. 7th Edition, enlarged. 8vo, Woodcuts, Copper plates, and Field-Book, 12s.

A TREATISE on PRACTICAL MENSURATION: containing the most approved Methods of Drawing Geometrical Figures; Mensuration of Superficies; Land Surveying; Mensuration of Solids; the use of the Carpenter's Rule; Timber Measure, &c. &c. By A. NESBIT. 11th Edition, 12mo, Wood-cuts, Copper-plates, and Field-Book. 6s. KEY, 5s.

ILLUSTRATIONS of the PRINCIPLES and PRACTICE of WARMING and VENTILATING; with Preliminary Remarks on Health and Length of Life. By D. B. REID, M.D., F.R.S.E. 8vo. With Diagrams and 320 Engravings on Wood, 16s.

RESEARCHES on LIGHT; an Examination of all the known Phenomena connected with the Chemical influence of the Solar Rays; embracing all the published Photographic Processes and many new Discoveries in the Art, &c. By R. HUNT, Secretary to the Royal Cornwall Polytechnic Society. 8vo, with Plate and Woodcuts, 10s. 6d.

A MANUAL of ELECTRICITY, MAGNETISM, and METEOROLOGY. By DIONYSIUS LARDNER, D.C.L., F.R.S. and C. V. WALKER, Esq., Secretary of the Electrical Society. (2 vols.) Vol. II., fcap. 8vo. Vignette title, 6s.

LESSONS on CHEMISTRY; for the Use of Pupils in Schools, Junior Students in Universities, and Readers who wish to learn the fundamental principles and leading facts. By WILLIAM H. BALMAIN. Fcap. 8vo, numerous Woodcuts illustrative of the Decompositions. 6s.

A TREATISE on FOOD and DIET: with Observations on the Dietetical Regimen suited for Disordered States of the Digestive Organs. By JON. PEREIRA, M.D., F.R.S., & L.S. 8vo, 16s.

DR. TURTON'S MANUAL of the LAND and FRESH-WATER SHELLS of the BRITISH ISLANDS. A New Edition, thoroughly revised, and with considerable Additions. By JOHN EDWARD GRAY, Keeper of the Zoological Collection in the British Museum. Post 8vo, Woodcuts and coloured Plates, 15s.

POPULAR CONCHOLOGY; or, the Shell Cabinet arranged: being an Introduction to the Modern System of Conchology; with a sketch of the Natural History of the Animals, an Account of the Formation of the Shells, and a complete Descriptive List of the Families and Genera. By AGNES CATLOW. Fcap. 8vo, 312 Woodcuts, 10s. 6d.

ELEMENTS of NATURAL HISTORY, for the Use of Schools and Young Persons; comprising the Principles of Classification, interspersed with amusing and instructive original accounts of the most remarkable Animals. By Mrs. LEE (formerly Mrs. T. E. BOWDICH), Author of "Taxidermy," "Memoirs of Cuvier," &c. 12mo. 55 Woodcuts. 7s. 6d., bound.

TAXIDERMY; or, the Art of Collecting, Preparing, and Mounting Objects of Natural History: for the Use of Museums and Travellers. By Mrs. R. LEE (formerly Mrs. T. E. BOWDICH), Author of "Memoirs of Cuvier," &c. Sixth Edition, improved, with an Account of a Visit to Walton Hall, and Mr. Waterton's method of Preserving Animals. Fcap. 8vo. Wood Engravings, 7s.

LONDON: LONGMAN, BROWN, GREEN, & LONGMANS.

Printed by WILLIAM BRADBURY, of Stoke Newington, and FREDERICK MULLET EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, printers, at their office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the office, No. 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, April 13, 1844.

The Newspaper.

SATURDAY, APRIL 13, 1844.

NOW BEING PUBLISHED.

LARGE, 1s. 6d.; SMALL, 1s.; GARDENERS' EDITION, 6d. THE BOTANIC GARDEN; OR, MAGAZINE OF FLOWERING PLANTS.

WITH MANY IMPORTANT AND USEFUL ADDITIONS.

By B. MAUND, F.L.S.

Each Number contains BEAUTIFULLY-COLOURED FIGURES OF ORNAMENTAL PLANTS, both herbaceous and shrubby, suitable for the Flower-Garden or Pleasure-Ground. With the derivations of names, classes, orders, height of the plants, time of flowering, native country, history, qualities, most approved modes of propagation and culture; and other information, interesting to every lover of a Garden. Annexed to each Number is the

FLORAL REGISTER,

With Woodcuts of admired Flowering Plants, mostly such as have been newly imported into this country; with the necessary information respecting them. Also,

THE AUCTARIUM,

in which are given, improved methods of cultivation of vegetables, fruits, and flowers; new discoveries connected with gardening, and the power of new manures; and miscellaneous information. Also, in each Number, till complete, a portion of Prof. Henslow's

BOTANICAL DICTIONARY,

With numerous Explanatory Woodcuts, and Explanations of the English and Latin words in use, written expressly for the Author. Thus the "Botanic Garden" contains Four distinct Works, proceeding together, at a trifling cost, once a month.

PRICES.	LARGE	SMALL

Vol. 2, in Two Parts, completing the British Flora, 24s. boards.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

Third Edition, Improved, 8vo. 7s. bd.

THE CULTIVATION of the GRAPE VINE on OPEN WALLS. By CLEMENT HOARE.

"Mr. Hoare has thrown more light on the subject of Vine culture than any British gardener who has written on the subject."—*Gardeners' Magazine.*

"One of the best productions upon any Horticultural subject which has been published for some years."—*Athenæum.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

9th Edition, improved, fcp. 8vo, with 22 Plates, 7s. 6d. cloth; with the plates coloured, 12s. cloth,

CONVERSATIONS ON BOTANY. The object of this work is to enable children and young persons to acquire a knowledge of the vegetable productions of their native country, by introducing to them, in a familiar manner, the principles of the Linnæan System of Botany. For this purpose, the arrangement of Linnæus is briefly explained; a native plant of each class, with a few exceptions, is examined, and illustrated by an engraving; a short account is added of some of the principal foreign species.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

WORKS BY PROFESSOR JOHNSTON.

I.—Price 10d.

A CATECHISM OF AGRICULTURAL CHEMISTRY AND GEOLOGY.

II.

The Third Edition greatly Enlarged, price 4s.

ELEMENTS OF AGRICULTURAL CHEMISTRY AND GEOLOGY. This little Work is intended to give a familiar and condensed outline of the subjects treated of more fully in the Lectures.

III.

LECTURES ON AGRICULTURAL CHEMISTRY AND GEOLOGY. PART I.—On the Organic Constituents of Plants, is completed, price 6s. PART II.—On the Inorganic Constituents of Plants, price 4s. 6d. PART III.—On the Improvement of the Soil by Mechanical Means and by Manures, price 7s. 6d. PART IV.—(Will be completed in June.) On Feeding of Stock, &c.

IV.

SUGGESTIONS FOR EXPERIMENTS IN PRACTICAL AGRICULTURE. 4 Numbers, price 1s. 6d.

V.

WHAT CAN BE DONE FOR ENGLISH AGRICULTURE?—A Letter to the Marquis of Northampton, President of the Royal Society. Price 1s.

VI.

THE ECONOMY OF A COAL FIELD. Price 2s. 6d.

Published by WM. BLACKWOOD & SONS, Edinburgh and London, and sold by all Booksellers.

WORKS ON AGRICULTURE AND RURAL ECONOMY,

PUBLISHED BY

WILLIAM BLACKWOOD AND SONS.

I.

THE BOOK of the FARM; detailing the Labours of the Farmer, Farm-Steward, Ploughman, Shepherd, Hedger, Cattle-man, Field-worker, and Dairymaid. By HENRY STEPHENS, F.R.S.E., Editor of the Journal of Agriculture. Illustrated by 35 Steel Plates, and upwards of 400 Woodcuts. The first volume may now be had, in royal octavo, elegantly bound in cloth, price 30s. The second volume is in course of publication, and will complete the Work.

II.

Annual Subscription, 12s.

NEW SERIES of the JOURNAL of AGRICULTURE, and the TRANSACTIONS of the HIGHLAND and AGRICULTURAL SOCIETY of SCOTLAND. Published Quarterly. Four Numbers are published.

III.

STABLE ECONOMY. A Treatise on the Management of Horses. By JOHN STEWART. A New Edition, in foolscap 8vo, with numerous Woodcuts, price 7s. 6d., bound in cloth.

IV.

By the same Author,

ADVICE to PURCHASERS of HORSES. A New Edition. Price 2s. 6d., bound in cloth.

V.

THE GRASSES of SCOTLAND; containing a Scientific Description of each Species, with Remarks on their Uses in Agriculture. By RICHARD PARNELL, M.D., F.R.S.E. Illustrated with a Figure of each species, and several varieties, amounting to 130, drawn and engraved by the Author. In one volume royal 8vo, handsomely bound in cloth, price 20s.

VI.

A SYSTEMATIC TREATISE on the THEORY and PRACTICE of DRAINING LAND, &c.; according to the most approved methods, and adapted to the various Situations and Soils of England and Scotland; also on Sea, River, and Lake Embankments, Formation of Ponds and Artificial Pieces of Water. The whole Illustrated by Plans and Sections. By JOHN JOHNSTON, Land-Surveyor. Third Edition. 4to, price 10s. 6d.

VII.

THE PRACTICAL PLANTER; containing Directions for the Planting of Waste Land, and Management of Wood, with a New Method of rearing the Oak. By THOMAS CRUICKSHANK, Forester at Carreston. 8vo, price 12s.

VIII.

SEVEN LITHOGRAPHED DESIGNS for the IMPROVEMENT of FARM COTTAGES and STEADINGS, with Descriptions, Specifications, and Estimates; Remarks on the Accommodations required under the Modern System of Husbandry, and the Defects of existing Farm Buildings. By JAMES CUNNINGHAM, Surveyor. Price 6s. 6d.

IX.

AINSLIE'S LAND SURVEYING; comprising the Theory and Practice in all its branches; in which the Use of the various Instruments employed in Surveying, Levelling, &c., is clearly elucidated by Practical Examples. Illustrated by 40 Copperplates. With a Treatise appended on Trigonometrical Surveying, Levelling, and Railway Engineering. By WILLIAM GALBRAITH, M.A. In 4to, price 15s.

X.

THE PRACTICAL IRRIGATOR and DRAINER. By GEORGE STEPHENS, Drainer, Member of the Nerecian and Wermlandska Agricultural Societies in Sweden. In 8vo, illustrated by Copperplates and Woodcuts, price 8s. 6d.

45, George-street, Edinburgh; 22, Pall-Mall, London.

MRS. LOUDON'S WORKS ON GARDENING.

I.

THE LADIES' FLOWER-GARDEN OF ORNAMENTAL ANNUALS, containing upwards of Three Hundred coloured Figures of the most showy and interesting Annual Flowers, with full Directions for their Culture. 4to., cloth lettered, 2l. 2s.; or half-bound morocco, gilt edges, 2l. 10s.

II.

THE LADIES' FLOWER-GARDEN of ORNAMENTAL BULBOUS PLANTS, containing above Three Hundred Coloured Figures of the most desirable Bulbous Flowers, with Descriptions and Directions for Cultivation. Demy 4to., cloth lettered, price 2l. 12s. 6d.; or half-bound Morocco, 2l. 18s.

III.

THE LADIES' FLOWER-GARDEN of ORNAMENTAL PERENNIALS, now publishing in Numbers, each containing from Fifteen to Twenty Figures accurately coloured from Nature. Price 2s. 6d. each Number. To be completed in Thirty Numbers.

IV.

THE LADIES' COMPANION TO THE FLOWER-GARDEN, being an Alphabetical Arrangement of all the Ornamental Plants usually grown in Gardens and Shrubberies; with full directions for their Culture. In one volume foolscap 8vo, with numerous Woodcuts representing the process of Grafting, Budding, Layering, &c. &c. Third Edition, enlarged. Price 6s. 6d. cloth. Nearly Ready. Published by WM. SMITH, 113, Fleet-street.

On the 1st and 15th of every Month,

THE PEOPLE'S FAMILY BIBLE.—Super-royal Quarto size—large type. Containing two Steel Engravings and two Sheets of Letterpress for One Shilling, forming a "Palace Bible at a Cottage Price."

Mrs. Chaplin, 1, Adelphi Terrace.

REPTON'S LANDSCAPE GARDENING—*Plain*, 30s.

E. A. Brande, Esq., Turnham Green.

WATERTON'S ESSAYS ON NATURAL HISTORY—8s.

The Rev. John A. Clarke, Staverton, near Daventry.

THE GARDENERS' MAGAZINE—9 vols., 9l. 17s.

Mr. H. R. Saunders, Duncombe Gardens, Dawlish; the numbers for July to Dec. inclusive
for 1842, the volume for 1843, and the January Number for 1844.

TO BE DISPOSED OF, a clean and perfect COPY of the GARDENER'S CHRONICLE for 1841—2—3; the first and second vols. neat; half of the third in Numbers. Price 3l. 10s.—Apply to Mr. DEARDEN, Bookseller, Nottingham.

WANTED, by a GARDENER, the *Gardeners' Chronicle*, at about Half-Price, to be posted regularly any day within Ten Days after its publication. Apply to N. G., Post-office, Bury St. Edmunds.

News of the Week.

The Easter Recess has produced the usual calm in political circles, and has left us few topics of interest which call for notice, either in our Home or Foreign news.—From France we learn that great excitement was occasioned in Paris on Friday, by the report of an attempt to assassinate the Duchess of Orleans. The funds fell rapidly on the first announcement of this event; for the misfortunes and virtues of Her Royal Highness have made her extremely popular. Subsequent inquiries, however, prove that the supposed assassin is a lunatic, and make it more than doubtful whether he had any intention whatever to molest the Princess. The proceedings of the Chamber of Deputies have been mostly of local interest; a motion in favour of a reduction of the stamp duty on newspapers, and another, subjecting all public functionaries to a regular course of promotion, being the chief business reported.—From Madrid we learn that the disturbances being now at an end, peerages and other honours have been conferred upon the members of the Cabinet and upon the Generals who were active in suppressing them. Queen Christina, it is said, has taken no part at present in the management of public affairs, but has expressed her wish that an amnesty to political offenders may be soon proclaimed. It is generally believed that this wish will be complied with, and the 27th inst. is mentioned as the day on which the amnesty will be proclaimed. The surrender of Carthagena was very nearly preceded by a fearful calamity, an officer of the insurgents having made an attempt to blow up the powder-magazine, which would have inevitably destroyed the city, but the intentions of the conspirators were fortunately detected in time to avert such a catastrophe.—The news from Portugal is still unsatisfactory on the subject of the military insurrection, the besieging forces having been put to the rout by the insurgent garrison of Almeida, and the constitution being suspended by the Government for a further period. The case of our countryman Dr. Kalley, whose imprisonment in Madeira on religious grounds has created so much interest, was tried last month at Funchal and decided in his favour, the Judge being of opinion that the laws of Portugal on questions of heresy do not apply to Protestants.—In Italy, the anticipated insurrection appears to have received a sudden check, from the publicity given to the designs of its leaders by the London newspapers. The apprehension of another intervention on the part of Austria has also tended to repress the spirit of revolt, and even Bologna is frightened into tranquillity by the prospect of a German army quartered upon its citizens. The people

at large, however, are still uneasy,and apparently expecting some extraordinary event. At Rome, the Jubilee, instead of pacifying the public mind, produced the contrary effect, and the inhabitants embarrassed the authorities by a run upon the savings banks for the amount of their deposits.—Our accounts from Turkey announce the important fact that the Sultan has at length acceded to the demands of France and England, and has engaged in future to prevent by effective means any Christian abjuring Islamism from being put to death.—From Greece we learn that the Constitutional Charter has been definitively voted by the National Assembly, and adopted by his Majesty; it was expected that the King would swear to the new Constitution on the 24th inst., after which the Chamber would be dissolved.—From the United States we have accounts of the fresh excitement created by the Texas and Oregon questions. The annexation of Texas had been again brought prominently before the public by a rumour that the President has actually signed a treaty for carrying it nto effect; and the Oregon question has been the subject of violent debates in Congress. The Senate had discussed a motion whether the President should give notice to Great Britain that it was the desire of his Government to terminate the convention by which both countries hold joint possession of the Oregon territory—which, if carried, would have amounted to a threat on the part of the United States to seize by force the territory in dispute. The debate was marked on the part of some of the speakers by great acrimony towards this country, and it was openly asserted that the citizens of the United States were influenced by a deep-seated hostility to England. The result of the division was favourable to the continuance of pacific relations. Twenty-eight to eighteen voted against the motion. The minority was composed exclusively of the democratic party; the majority consisted of twenty-five Whigs, and three supporters of Mr. Calhoun, the new Secretary of State, who is said to have accepted office solely for the purpose of bringing the Oregon and Texas questions to a conclusion.

Home News.

Court.—Her Majesty, the King and Queen of the Belgians, the Prince of Wales and the Princesses, have remained at Windsor Castle during the week. Her Majesty has enjoyed her usual morning walk in the grounds of the Castle, and has taken daily exercise in a pony-phaeton, accompanied by the Queen of the Belgians. On Sunday Her Majesty and King Leopold attended Divine Service in the private chapel of the Palace, and the Queen of the Belgians attended high mass at the Roman Catholic Chapel at Clewer. On Wednesday afternoon the King of the Belgians went to Spital to witness the Garrison Steeple Chace, which had attracted a great number of visitors to Windsor. In the evening of the same day, Her Majesty, the King and Queen of the Belgians dined with the Duchess of Kent at Frogmore Lodge. Prince Albert accompanied by the Prince of Leinengen, and attended by Captain Seymour (Groom in Waiting to his Royal Highness), and Mr. G. E. Anson, his Treasurer, arrived at the Castle on Thursday evening, having travelled from Paddington to Slough by the Great Western Railway. His Royal Highness landed at Dover from Ostend about half-past two, P.M., and travelled to town by the Dover Railway. The Prince is said to have returned in excellent health.—It is stated that Eaglehurst Castle in the Southampton River has been selected as the Royal Nursery during the residence of her Majesty and Prince Albert at Osborne House in the ensuing summer. The Countess of Charlemont has succeeded the Countess of Dunmore as the Lady in Waiting. The Earl of Morton has succeeded Lord Rivers as the Lord in Waiting, the Hon. Captain Duncombe has succeeded Colonel Drummond as the Groom in Waiting, and the Honourable Misses Liddell and Paget have been succeeded by the Honourable Eleanor Stanley and the Honourable Clementina Hamilton as the Maids of Honour in Waiting on her Majesty. The next drawing room takes place on Thursday next the 18th instant.

Death of Lord Abinger.—As anticipated in our last, the illness of Lord Abinger has terminated fatally, and he expired at Bury St. Edmunds on Sunday afternoon, tranquil but perfectly unconscious, in the presence of his lady and two of his sons. His lordship was long known to the public as Mr., and subsequently as Sir James Scarlett. He was a native of Jamaica, where his family had been long resident, and held considerable property, his brother having been many years the Chief Justice of the island. He was in his 76th year, and had been for considerably more than half a century before the public eye. He was entered a Fellow Commoner of Trinity College, Cambridge, at the early age of fifteen, and took the degrees of B.A. and M.A. in that university. In 1791 he was called to the bar, and in 1819 was returned to Parliament as Member for Peterborough. He was appointed Attorney-General in April, 1827, resigned the office in January, 1828, was again nominated to it in March, 1829, and finally resigned it in November, 1830. In 1832 he was elected M.P. for Norwich, and in December, 1834, was raised to the Bench as Lord Chief Baron of the Exchequer, and admitted to her Majesty's Privy Council. In Jan., 1835, he was raised to the Peerage by the title of Baron Abinger, of Abinger, in the county of Surrey. Lord Abinger's career at the bar was one of the most remarkable instances of success on record; he was a leader of the foremost class, both in Westminster Hall and on the Northern Circuit, and was unrivalled in his power over the feelings and judgments of a jury. He was, however, by no means so successful in Parliament—confirming the proverbial incompatibility of forensic and Parliamentary eminence. As a Judge, he has been the subject of a variety of criticisms, all of which, though differing on some other points, agree in regarding his conduct on the bench as unequal to his high reputation at the bar. He commenced political life as a Whig, but joined the Conservatives in 1829, under the Duke of Wellington, at the time when the Roman Catholic question created such a division in the ranks of the Tory party. His Lordship was married on the 22d August, 1792, to Louise Henrietta, third daughter of Peter Campbell, Esq., of Kilmorey, in Argyleshire, by whom he had six children. Within the last few months Lord Abinger was married a second time, and the lady is now his widow. The noble Lord is succeeded in his title by his eldest son, Robert Campbell Scarlett, M.P. for Horsham, now Lord Abinger, who was married on the 19th July, 1824, to Sarah, daughter of George Smith, Esq., late Chief Justice of Mauritius, and has several children. His eldest daughter married Lord Campbell, and was created Baroness Stratheden, of Cupar, Fife, in 1836.

Parliamentary Movements.—A vacancy has occurred in the representation of Horsham, by the accession of the Hon. Mr. Scarlett to the Peerage, for which Mr. Hurst, the former Whig candidate, has come forward. The approaching law appointments will cause further vacancies in the boroughs represented by the learned gentlemen.

Law Appointments.—It is believed that Sir Frederick Pollock, Attorney-General, will accept the office of Chief Baron of the Exchequer, vacant by the death of Lord Abinger, and that Sir William Follett will be the Attorney-General. The names of three Queen's Counsel have been mentioned as claimants for the post of Solicitor-General, which Sir W. Follett would thus vacate, viz., Mr. Kelly, Mr. Godson, and Mr. Thesiger.

Lord-Lieutenancies.—The two vacant Lord-Lieutenancies of Westmoreland and Cumberland have both been conferred on Lord Lonsdale.

Public Petitions.—The last report of public petitions to the House of Commons gives altogether 738,139 petitioners for a repeal of the Irish union; 5592 petitioners against the union of the dioceses of Bangor and St. Asaph; 42,659 petitioners against any repeal of the existing corn laws; 6820 petitioners in favour of a ten hours factory bill; 54,779 petitioners for a reduction of the tobacco duties; 10,197 against the New Factories Bill, and 1632 petitioners in favour thereof; 2237 for the establishment of local courts; and 827,428 for an inquiry into the late Irish State Trials.

Post Office.—Some voluminous statistical returns have recently been presented to the House of Commons, on the motion of Lord Ebrington, Sir H. Douglas, Bart., Dr. Bowring, and Mr. Hutt. The following results are obtained:—The total number of letters alleged to be missing amounted, in October and November, 1839, to 588, of which 224 were found; in October and November, 1842, to 2058, of which 592 were found; and in the two months ending July 5, 1843, to 1800, of which 520 were found. The number of applications as to delay of letters amounted, at the above-mentioned periods, to 175, 316, and 260, respectively. The number of letters delivered in the United Kingdom amounted, in one week of 1839, to 1,585,973; in one week of 1842, to 4,202,546; in one week of 1843, to 4,020,246; and in the week ended May 21, 1843, to 4,212,658; showing that the recent reduction in the rates of postage has nearly trebled the number of letters despatched through the Post-office. The total number of persons employed in the post-offices of the United Kingdom in May, 1843, amounted altogether to 11,302; of whom 8398 were employed in England and Wales, 1399 in Scotland, and 1505 in Ireland. This return, however, only relates to such situations as the Postmaster-General appoints to. The total number of letters forwarded through France to the East Indies, *viâ* Egypt, amounted in 1839 to 20,827; in 1840, to 72,516; in 1841, to 45,536; in 1842, to 44,079; and in 1843, to 14,509. The amount of money paid to France for the said letters was, in 1839, 1147*l.*; in 1840, 4457*l.*; in 1841, 3341*l.*; in 1842, 3549*l.*; and in 1843, 1307*l.* The number of letters received from India in the above five years amounted respectively to 31,123, 122,396, 108,027 106.455, and 37,120. The number of newspapers transmitted to Indi *via* France amounted during the past year to 33,096, for which the sum of 76*l.* was paid to the French Government. The number of outward letters not passing through France, forwarded by English steamers through Egypt, amounted in 1841 (in round numbers) to 225,000; in 1842, to 287,000; and in 1843, to 216,890. The number of homeward letters transmitted from India by the same channel was, in 1843 (including eight months of that year), 170,814. The number of chargeable letters which passed through the London general post (inwards and outwards) during the first four weeks of the year 1843 was as follows, viz.:—unpaid, 312,839; paid, 2,431,231; stamped, 2,972,828; total, 5,716,898. The number of letters which passed through the London district post (exclusive of all general post letters) during the same period was, unpaid, 112,293; paid, 837,624; stamped, 1,020,091; total, 1,971,008. The estimated average for four weeks in the year 1839 was, for general post letters, as follows, viz.:—unpaid, 1,358,651; paid, 263,496; total, 1,622,147. The net revenue of the Post-office establishment of the United Kingdom (exclusive of charges in the Government departments) amounted in 1839 to 1,614,353*l.*; in 1840, to 1,589,486*l.*; in 1841, to 393,166*l.*; in 1842, to 444,115*l.*; and in 843, to 478,479*l.* 216,585 money orders, to the amount of 466,798*l.*, were issued and paid in London during the quarter ended the 5th Jan., 1843; and 981,19: money orders, to the amount of 2,055,192*l.* were issued in England and Wales during the same time. The number of letters actually registered in London was, in June, 1843, 8112.

Poor Law.—From returns just prepared for Parliament respecting the amount expended for the relief and maintenance of the poor, &c., it appears that there are 590 unions in England and Wales, of which the population was 13,993,967. The average annual expenditure for the relief of the poor, three years prior to the union, was 5,608,934*l.* In 1841 the expenditure was 4,288,520*l.*; in 1842, 4,438,660*l.*; and in 1843, 4,679,495*l.* Under this head of expenditure are included the costs of maintenance, out-door relief, establishment charges with salaries, work-house and emigration loans repaid, and other purposes immediately connected with the relief of the poor.

International Copyright Act.—The new Bill to amend the law relating to international copyright, prepared and brought in by Mr. Gladstone, Mr. Greene, and Mr. Bingham Baring, proposes to enact that her Majesty, by order in Council, may direct that authors of books, prints, articles of sculpture, first published in foreign countries, shall have a copyright in such books within her Majesty's dominions. That authors and composers of dramatic pieces and musical compositions first publicly represented and performed in foreign countries, shall also have similar rights, the particulars to be entered in the register-book at Stationers' Hall. All copies of books wherein copyright is subsisting under the Act, printed in foreign countries, other than those wherein the book was first published, are prohibited to be imported; and the officers of the Stationers' Company are to deposit books, &c. in the British Museum within one month after receiving.

Foreign.

France.—A variety of rumours prevailed on Friday of the Duchess of Orleans having been insulted or attacked on coming out of chapel. It appears that this arose from the fact of a German of disordered intellect being arrested in a church during divine service, when her Royal Highness was present. The following is the account of the affair given in the *Debats*:—"This morning (Friday), at the Church of Chauchat, a man, who was in the gallery, in front of that occupied by her Royal Highness the Duchess of Orleans, made some gestures which drew upon him the attention of the persons placed in the church to keep order. At the moment that they were ordering the individual to quit the church, he drew a very small dagger from his pocket, without, however, appearing to have any intention of using it. He was taken out of the chapel, and recognised as a German by birth, who in general resides in Hanover, and whose mental faculties are deranged." The *Patrie* gives a different account of the affair:—"The commencement of the Bourse it says was greatly agitated to-day. People who pretended to be well informed, stated that the Duchess of Orleans had escaped becoming the victim of an assassin in going to pay her devotions at the new Evangelical church in the Rue Chauchat—that a man, armed with a poignard, had rushed upon her, and that an officer in the service had warded off the blow by receiving it himself. The rumour of such an attempt made against a princess so justly popular as her Royal Highness created an immense sensation. The rumour at first lowered the Three per Cents. 25 cents., but fortunately the Bourse is not far from the Rue Chauchat, and as soon as the real truth was known, the funds rose again to 83. The following is the truth, according to information taken on the spot:—A man of about 50 years of age, pretty well dressed, had been pointed out to the police as being furiously deranged. A peace officer seeing him enter the church where the Duchess of Orleans was, rushed to stop him. A struggle ensued, and the officer received on the hand a blow from a poignard. He, however, overcame the man, who was carried to a place in the neighbourhood and searched, when another knife was found upon him. The affair, as may be conceived, made a great sensation in the church, and the princess, who was in a raised gallery, having asked what was the matter, was informed that a thief had been made prisoner. But the rumour in travelling increased and improved, and we know what it became by the time it reached the Bourse, when it so happened that they had no other rumours of any kind to talk about."—On Thursday the Chamber of Deputies decided in favour of taking into consideration the proposition of M. de Montlaville, for the repeal of the stamp duty on newspapers. The motion was strongly opposed by the Minister of Finance on the part of the Cabinet, but the Opposition carried the question by a majority of six—the members voting 146 in favour of the motion, and 140 against it.—The bureaux of the Chamber of Deputies on Thursday took into consideration the New Customs' Bill. The principle of the Bill, viz., a moderate protecting system, met with but little opposition. Objections were made only on the amount of protection necessary to be granted to national industry. Several members spoke strongly in favour of linen and hemp threads and cloths, for which the Bill merely sanctions the augmentation of duty promulgated last year by ordinance. The two other questions which most occupied the attention of the bureaux, were machinery and oleaginous grains. The Minister showed that the free exportation of English machinery rendered protection more necessary for French makers. As to the oil seeds, he thought that the enormous increase of the quantity imported had gravely attacked the interests of French cultivators. On Mon-

day. M. St. Marc Girardin brought forward his motion relative to the appointment and promotion of public functionaries. The object of the motion was to subject all public functionaries to a regular course of promotion. The motion was assented to by M. Guizot, on the part of the Ministry; and the question will be taken into consideration on a future day.—The editors of the *Gazette de France* and of the *Nation* newspapers were on Saturday condemned to one year's imprisonment and a fine of 12,000 francs each, for a libel on the Government. The libel was contained in a violent letter, written by M. de Rochefoucauld, duke de Doudauville, which was published in the *Gazette* and copied by the *Nation*. The offence of which they were found guilty was an attack upon the rights derived by the King from the will of the nation; adhesion to another form of government, in alleging the existence of rights to the Throne in a person who is banished from France for ever; bringing the Government into hatred and contempt; and an attack upon the sanctity of the oath, and on the respect due to the law. The Duke de Doudauville, though the writer of the letter, has not been prosecuted.—Disturbances which had at one moment a character of some gravity, have taken place at Rive de Gier, in the neighbourhood of Lyons, in consequence of a combination among the working miners. Several persons have been arrested. On the 15th the escort which was conducting seventeen of the rioters who had been made prisoners to St. Etienne, was assailed at the moment when it was passing through the village of Grand Croix, by a body of rioters, who endeavoured to rescue the prisoners. A shower of stones wounded a considerable number of the soldiers and all the officers, and shots were even fired. Thus assailed, the escort found itself compelled to use its arms. Six labourers were wounded, of whom three are in a dangerous state. The rioters were immediately dispersed, and St. Etienne, Lyons, and St. Chamond, are now perfectly tranquil.—The number of English visitors at Paris is at the present moment greater than it has been ever since the peace: not less than 500 passports are daily presented at the English Embassy for *visa*.

SPAIN.—Letters from Madrid of the 1st inst. state that, the disturbances having been put down, the members of the Cabinet have now turned their attention to the rewards which ought to follow their exertions in the past crisis. Accordingly, M. Gonzales Bravo and the Marquess de Penaflorida have been nominated by her Majesty Knights Grand Crosses of the Order of Charles III. General Mazzaredo has been appointed a Lieutenant-General, and M. Carrasco, the Minister of Finance, "whose activity and zeal have already produced such remarkable results," has been elevated to the dignity of Count of Santa Olatla. M. Donozo Cortes, who was the person sent to Paris to invite Queen Christina to return to Spain, has been made a Knight Grand Cross of the Order of Isabella the Catholic, and has been appointed private secretary to Queen Isabella, with a salary of 50,000 reals. Several deputations have presented addresses of congratulation to Queen Christina on her return, and preparations were being made for a grand military concert, which was to be given by the garrison of Madrid to celebrate that event. By her partisans it was affirmed that she had, as yet, taken no part in the management of public affairs, contenting herself with reposing great confidence in the Bravo Cabinet, and expressing the wish that an amnesty to political offenders be soon proclaimed. It was rumoured that this act of mercy would be promulgated on the 27th of April, her birth-day, and that at the same time various promotions would be made and titles conferred.—The Minister of War had received a despatch from General Roncali, announcing his entrance into Carthagena and the escape from that city of the chiefs of the late insurrection, leaving only a few subordinates who were unworthy the death he had designed for the leaders of the revolt. It appears that some severe fighting took place in Carthagena before it capitulated between the revolted Gerona regiment and the populace. On the morning of the surrender an officer belonging to the Gerona regiment, and one of the Catalonian volunteers, made an attempt to blow up Carthagena by firing upwards of 150,000 lbs. of gunpowder in the principal magazine, where they were on guard. Fortunately some soldiers suspecting their intentions followed them into the building, and prevented the consummation of such an act of desperate wickedness by seizing the conspirators, who a short time afterwards committed suicide. —The *Heraldo* indignantly records another insult offered to Spain by Morocco, some fishermen of Algesiras having been fired at on approaching the Barbary coast.

PORTUGAL.—We have accounts from Lisbon of the 3d, and from Oporto of the 4th inst. The latter mention a mutiny at Coimbra, which originated in some soldiers wishing to desert to Almeida. The besieging forces of Viscount Fonte Nuova, seeking to cut off a convoy of provisions for Almeida, were put to the rout by the troops of Count Bomfim, from that fortress. Nevertheless, the *Diario* states that the artillery had arrived and opened fire upon the fortress. The Government finds it necessary to suspend the constitution for a further term, and all the guarantees of individual liberty are suspended till the 23d of April.—The case of Dr. Kalley, the Scotch physician, who was last autumn illegally imprisoned at Madeira, on a charge of "blasphemy and heresy," and "abetting apostasy and heresy," has been tried at Lisbon and Funchal. On the 24th Feb., the Judge-Conservador at the latter place passed the following sentence:—"Supposing the British subject, Dr. Kalley, to have disturbed the public order of this island by preaching doctrines opposed to its religion, as is sworn by the witnesses; and considering this preaching an abuse which degenerates into crime; nevertheless, the said Dr. Kalley, as a Protestant, which he is, is not punishable, seeing that there does not exist a law to punish in the person of the accused the act charged. I, therefore, declare the accusation given against the said Dr. Kalley irrelevant, and order him to be held clear of guilt." Baffled on the religious question, Dr. Kalley's prosecutors, it is understood, are going to institute proceedings against him as a disturber of the public peace. On the other hand, Dr. Kalley, at the suggestion of Lord Aberdeen, is about to petition the Government at Lisbon for compensation for the loss of his professional income during his illegal imprisonment.

GERMANY.—The papers state that the object of Prince Albert's visit to Gotha is supposed to be the regulation of family matters, especially the division of the private property left by his father, the late Duke. It is well known that the deceased was very economical; and since, as it is now affirmed, the sums paid by Prussia for the lordship of St. Wendel, on the left bank of the Rhine, which was ceded to it, went into the private coffers of the Duke, the amount of his property is stated at several millions.—The Duke of Nassau received last week, by an express, the intelligence that his brother, Prince Adolphus, would not be able to be at Wiesbaden to be present at the *fêtes*; because, in a fit of anger, he had shot a nobleman in Hungary, who during a hunting party on the prince's preserves wantonly shot two of the prince's servants.—The King of Wurtemberg has signified his especial satisfaction with the services rendered by our countryman, Professor Vignoles, respecting the Wurtemberg railroads, by the presentation to him, over and above his ordinary remuneration, of a magnificent gold snuff-box, having a miniature of His Majesty set in diamonds, valued at 300 guineas.—The active Berlin Police Director, Dunker, has just discovered at Berlin a nest of swindlers, who were to have established themselves in that city; and amongst other proceedings they had in view, was the issuing and negotiating of forged bills of exchange on various principal continental cities.—A letter from Carlsruhe states that the fortifications of Rastadt are proceeding actively. In three years the town will be transformed into a fortified place, where 3300 troops are to be kept in time of peace.

ITALY.—There is no news of any importance from Italy this week, the leaders of the intended insurrection having been so surprised by the publication of their projects in the London papers, that it is not unlikely that their intended movements will be abandoned for the present, their most secret plans being evidently no longer in their keeping. The apprehension of an Austrian intervention also checked the designs of the disaffected, and Bologna, where, a month ago, it was not safe to walk the streets after nightfall, is now so pre-occupied with that fear, that perfect tranquillity prevails in the city and throughout the province. In the legation of Forli, however, the public mind was uneasy and expecting some extraordinary event. The population everywhere congregated in crowds on the passage of the mail coaches. At Rimini, a company of pontifical volunteers having been sent to disperse one of those assemblages of people, a collision ensued, in which several lives were lost on both sides. The Jubilee at Rome was observed on the 22d, 23d, and 24th, and produced a contrary effect to that which the Pontifical Government expected from it, for the inhabitants, alarmed at it, hastened to withdraw their money from the savings banks and banks, which has greatly embarrassed the authorities. The movements of the Austrian troops are continued in Lombardy.—It is stated in a letter from Milan, March 25, that the Archduchess Maria-Louisa of Parma has, by a decree of the 20th, re-established the order of the Jesuits in her states, and authorised the opening of a Jesuit convent at Parma. It has also been decided that the Jesuits are to be charged with the duty of secondary instruction.—The Pontifical Academy of Fine Arts, of St. Luke's, at Rome, has recently elected our distinguished countryman, Mr. C. R. Cockerell, Professor of Architecture at the Royal Academy, a "member of merit" of their body, in the place of the Cavalier Ferdinando Bonsignore, chief architect of the King of Sardinia, lately deceased. The Pontifical Academy associate honorary members *ad libitum*; but the "members of merit" are limited to 20.

TURKEY.—Accounts from Constantinople of the 20th ult. announce that the Porte has at length assented to the demands of England and France on the subject of executions for causes connected with religion. It appears that on the 18th a conference took place between Sir Stratford Canning, the Baron de Bourqueney, and Riza Pasha, the result of which was not satisfactory. Riza Pasha told the Ambassadors that the point at issue was a mere religious question, which regarded the priests, and not the Government, and that they were not disposed to make the least concession. He added that the Sultan, however anxious to gratify the Ambassadors, could not abrogate a religious law, but would pledge himself that it should not hereafter be enforced. The Ambassadors were not satisfied with this answer, and Sir Stratford Canning had demanded an audience of the Sultan. On the following evening, the following official note was transmitted by the Porte to the English Ambassador and the Ministers of France and Prussia. "His Highness the Sultan is irrevocably resolved to maintain the friendly relations, and strengthen the bonds of perfect sympathy which unite him with the great Powers. The Sublime Porte engages for the future to prevent, by effective means, any Christian abjuring Islamism from being put to death." Another cause of disagreement between Turkey and France has occurred at Latakia, where an attack had been made upon a Catholic church and congregation and the French flag insulted; but the Ministers on receiving an account of the transaction, at once offered the fullest reparation to the French Ambassador, and the affair will therefore lead to no serious results. A conspiracy against the Government, in which upwards of 300 individuals were concerned, was last month detected at Damascus. One of the conspirators, a Sayd, or descendant of the Prophet, informed against the rest, and was afterwards shot dead in the streets by another Effendi, whom he met in his way from the house of the Pasha. A disturbance then took place, but it was summarily suppressed by the military. The conferences at Erzeroum were last month interrupted in consequence of the haughty demeanour and unreasonable exactions of Envary Effendi, the Turkish Plenipotentiary. A complaint on the subject has been addressed by Sir S. Canning to the Porte, which has promised an immediate remedy. Albania continues to be a prey to the greatest disorders; according to the last accounts the people had risen and pillaged the town of Coma-nova. A report prevails that the Sultan is about to take an excursion by sea to Broussa, Smyrna, the Dardanelles, &c.

GREECE.—Accounts from Athens of the 20th ult. state that the Constitutional Charter has been definitively voted by the National Assembly, and adopted by his Majesty. It appears that the King returned the draft of the Charter, which had been sent to him for ratification, with so many alterations, that it became necessary for the Assembly to deliberate upon them with closed doors. At the end of three days it was announced that ten of the King's alterations were accepted, and sixteen or seventeen rejected, the Assembly being unanimous on all points. This decision would have again placed the King in a false position, but his Majesty seems to have been suddenly convinced of the error he had been led into, and, within an hour of receiving the final decision of the Assembly, sent down a message to say he adopted the Constitutional Charter as it now stood. The message was received with great acclamation by the Assembly, and the populace went under the Palace windows and cheered, when his Majesty appeared at the balcony and bowed in acknowledgment. It is now expected that all will be ready for the King to swear to the new constitution on Sunday, the 24th inst., when the Assembly will be dissolved. The country is perfectly quiet, but very great and general misery prevails.

MALTA.—The Medea war steamer arrived in this harbour on the 28th ult., with Mr. Fellowes and the other persons engaged in the Xanthian expedition. Previous to their embarkation they underwent great hardships and had almost insurmountable difficulties to contend with. They have, however, succeeded in bringing home 20 cases of marbles and casts, leaving on the beach seven cases, containing the unwieldy portions of the horse and chimæra tombs, which must remain until a larger vessel is sent to hoist them in. It is rumoured that the Warspite, 50, has proceeded from Athens for this purpose.—Mr. Penrose, the clerk in charge of Her Majesty's steamer Polyphemus, has been put under an arrest upon charges of forgery and embezzlement of the public moneys. Admiral Sir L. Curtis has held a court of inquiry, and the prisoner has been handed over to the civil power, and lodged in the common gaol, previous to committal for trial.

DENMARK.—Letters from Copenhagen of the 30th ult. state that the funeral of the great sculptor Thorwaldsen took place on that day. The almost royal honours paid to his remains prove how sincere was the estimation in which this excellent man was held by all who knew him, and they are worthy of being recorded as an additional proof that one of the greatest spirits of our time has passed away. The body lay in state in the museum which he founded, and on the day of the funeral the procession was headed by two of the most eminent members of the Academy of Fine Arts, followed by about 800 students; after them came all Thorwaldsen's countrymen, all the Icelanders now residing at Copenhagen—and then almost without exception all the artists in the city. The plain open coffin came next, simply ornamented on one side with a beautiful carving of the Fates, after a design from the great master's own hand, and a design representing Victory on the other. On the coffin were placed interwoven branches of palms and cypress, but none of the numerous decorations belonging to the deceased sculptor. On the canopy of the hearse was placed one of his last and most beautiful works,—Hope leaning on an Anchor. Next came, immediately after the corpse, as chief mourners, all the members of the Academy of Fine Arts, headed by their President, his Royal Highness the Crown Prince, followed by all the other Royal Princes, and a great number of the principal officers of state, officers of the army and navy, and upwards of 8000 citizens of all classes. All the streets through which the procession passed, from the Museum to the Church of the Holy Ghost, were lined with the different companies of trades, with their colours and ensigns covered with crape, and they themselves in deep mourning. The streets, from the Church of the Holy Ghost to that of Nôtre Dame, where his last resting-place was prepared, were lined by the different regiments of the garrison, and the whole distance from the Museum to the Nôtre Dame (about an English mile) was, according to the ancient Scandinavian custom, strewn with white sand intermixed with juniper leaves. At the entry of the church His Majesty the King, in deep mourning, received the corpse, and after the coffin had been placed on a catafalque which had been erected for that purpose, the *Requiem* was performed, that which was written by one of Thorwaldsen's most intimate friends, the celebrated Adam Oehlenschlager, and composed by Glaser. The Bishop of Zeeland then performed the funeral service, and delivered a most eloquent oration; after which the coffin was consigned to its last abode, during which time the students, amounting to several thousands, who had not found admittance into the interior of the church, and had place themselves in the churchyard, sang a hymn, also written and composed for the occasion. Her Majesty and all the

Royal Princesses occupied the Royal pew during the whole of the ceremony. The bells of all the churches in the capital tolled from 11 till 2 o'clock, and when the procession came in sight, the 'Dead March' from *Saul* was performed. As was anticipated, Thorwaldsen has left nearly all his property, which is more considerable than was supposed, to the museum that bears his name. A monument upon a magnificent scale will be erected to his memory, at the public expense, for which subscription lists have already been opened, headed by His Majesty, with the munificent sum of 25,000 dollars.

United States.—We have accounts from New York to the 23d ult. The annexation of Texas, a subject which was touched upon with an evident feeling of satisfaction by the President in his last message to Congress, was again prominently before the public from a rumour which prevailed that a treaty for carrying it into effect had been actually signed by the President, and would shortly be laid before the Senate with every chance of being favourably entertained. The subject had been incidentally mooted in the House of Representatives, but nothing was elicited to confirm or contradict the statement. Mr. Webster had denounced the annexation as a project likely to prove injurious to the stability of the United States, in a letter which was going the round of the papers. The affair of the Princeton, and the melancholy result which accompanied the explosion of the gun on board that vessel, had been sifted by a committee of naval officers appointed to inquire into the circumstances; their report exonerated Captain Stockton from all blame, and attributed the sad tragedy to causes which could not have been foreseen or guarded against. The debate upon the Oregon territory was carried on in the House, and language of the most virulent description against Great Britain was indulged in freely by those who had introduced the debate. The New Orleans papers contain an account of a steamboat collision, which took place at Old River, of a most fatal character. It happened at night, when the majority of the passengers were in bed. One of the boats immediately sunk, by which nearly 80 persons were drowned. The other boat was comparatively uninjured, and her passengers escaped with nothing worse than the shock. The *Aurora* says, that the young man sentenced to death for aiding in the escape of a quadroon slave, and whose case is so well known, from the notice taken of it in Parliament, has been pardoned by the Governor of South Carolina. He is, however, to be publicly whipped.—The *New York Journal of Commerce* has the following news from Havannah:—"We learn from the passengers of the bark Hualco, who left Havannah the 8th inst., that some of the slaves who had participated in the late insurrection at Matanzas, had implicated several of the planters at that place, who were arrested by the authorities and thrown into prison." The object of the conspiracy was to seize on the whole island of Cuba, and murder all the white population.

West Indies.—By the Dee West Indian steam-ship we have accounts from Jamaica to the 10th ult., and from the other islands to a corresponding date. The Jamaica papers state that they have little variation to report in the aspect of their affairs, with the exception that the coffee crops are likely to be good, and that the planters are inspired with more courage from the increased patronage extended to the Agricultural Society. The merchants of Kingston were taking steps at the date of these advices to incorporate themselves with the Agricultural Association for stimulating the cultivation of their staples by free labour. In some districts of the island there had been seasonable showers, but on the south side the weather continued dry and breezy, and a smart shock of an earthquake was experienced on the night of the 24th of February. The House of Assembly was prorogued by his Excellency Lord Elgin on the 28th February. Immigration was still active at Trinidad. The weather in Barbadoes was sultry, and had been attended with partial damage.

Metropolis and its Vicinity.

The Easter Holidays.—Independently of the railway excursions, which tempted many hundred persons to seek their Easter enjoyment in the country, the steamers, &c., on the river were crowded with persons for less distant places. No less than 105 steamers were employed in conveying passengers on the river; of these 20 were for Gravesend, where 10,000 persons landed on Sunday morning. The number of passengers who filled the above-bridge steamers were almost beyond calculation. There were no fewer than 30 iron and wooden steamers continually calling at the various piers, embarking and landing passengers. The numbers did not decrease as the week advanced, and up to Tuesday night 150,000 persons landed and embarked at the Greenwich piers. Notwithstanding this, the sight-seers in London appeared as numerous as usual. At the British Museum there were on Monday 21,339 visitors, being an increase of 2907 over last Easter Monday; at the National Gallery there were nearly 10,000 visitors; at the Chinese Collection about 4000, and at the Tower nearly as many; while St. Paul's and Westminster Abbey, where fees are paid for admission, were comparatively deserted. The influx of visitors to the Metropolis from the provincial towns during the present holidays is unusually great, occasioned, no doubt, by the cheap means of conveyance now afforded by railways as well as steam-vessels. Thousands who had never seen London have arrived since Good Friday from Ipswich, Yarmouth, Dover, Brighton, and other towns.

British Institution.—The election of a keeper for this institution took place last week, when Mr. John Seguier, the brother of the late keeper, was chosen to be his successor. The only other candidate was Mr. John Burnet, the painter and engraver.

South Sea Company.—The project which at the last meeting of proprietors of South Sea Stock was announced to be in contemplation was made known on Saturday. Proposals are now made to form a public company, to consist of proprietors of South Sea Stock, for the execution of trusts, and to be called the "Trust Company." Such portions of capital stock of the South Sea Company as the proprietors may think proper to subscribe, not less in amount than 500,000*l.*, are to be set apart as a guarantee fund. This fund will be open to contribution by such proprietors until six months after notice shall have been given of the commencement of business, but after that period, subscribers will have to pay in addition the difference in value between the original stock and the trust capital stock. The fund so subscribed will be under the management of the present directors or ex-directors of the South Sea Company, and will consist of a chairman, deputy-chairman, and nine other directors. The business of the intended company to be carried on at the South Sea House or elsewhere, as the provisional committee or directors may decide. The liability of the subscribers to be limited to the amount of the guarantee fund, but it is distinctly understood that the trust funds deposited are in no way liable for any general loss. It is proposed to undertake in the first instance such trusts only as relate to personal estate, and all property held in trust will be invested in the names of trustees to be appointed by the directors. A commission is to be charged on the amount administered, according to a scale to be fixed hereafter. All investments of trust property to be in Government funds, or in South Sea Annuities, or in real securities, unless otherwise directed by the trust. A deed of settlement is to be prepared for carrying these and other objects connected with the management of the proposed company into effect.

Custom Frauds.—After a renewed investigation, undertaken at the urgent request of the party himself, Mr. Robert Cox, landing-waiter at the Customs, has been reinstated in his employment. As this gentleman's name appeared among the "suspensions," it is but justice to record this fact of his entire exoneration.

The Thames Embankment.—In addition to our notice of the report of the commission on the Thames embankment in our last Number, the following particulars may be acceptable to our readers:—The proposed line of embankment commences at Westminster-bridge, with a projection agreeing with the present front of the Houses of Parliament, and is continued to the end of Fife-House Garden as a solid embankment, leaving a dock for the wharfs between the Board of Control and Richmond-terrace. By the plan it would appear that a footpath, 20 feet in width, is contemplated between Westminster-bridge and Hungerford, at a level of four feet above high-water mark, and that provision is made for a landing-place for the Queen, instead of Whitehall-stairs, between banks of mud, by which she has hitherto been obliged to approach the river. From Fife-House Gardens to Blackfriars-bridge the embankment consists of a detached terrace, leaving the space between it and the wharfs for the accommodation of the barges and the wharf traffic, and allowing a passage from the river by openings through the terrace at convenient distances. The carriage-way is 50 feet wide, and commences at Whitehall-place, whence it ascends to 10 feet above high-water mark, and is carried on pillars to the line of the terrace, which joins near Hungerford-bridge, about 40 feet inside the Middlesex Pier. It then continues under the second arch of Waterloo-bridge, where it leaves a headway of 17 feet, and before reaching the Temple Gardens it gradually descends 6 feet, at which level, viz., 4 feet above high-water, it is carried in front of the Gardens, which will not thus be shut out from the river. From the Temple Gardens it rises to the level of Chatham-place, Blackfriars, thus forming an uninterrupted communication between Whitehall and Bridge-street. The importance of this communication, free from carts and waggons, cannot be too strongly insisted on in the present crowded state of Fleet-street, which for some hours in the day exhibits such a state of confusion and blockade as cannot easily be described, where the omnibuses themselves are frequently obliged to leave their route and reach the Bank by passing along Farringdon-street and Newgate-street, and where pedestrians are in imminent danger, not only in crossing, but in passing along the foot-path. It is objected, however, that although this will relieve Fleet-street, it will be no relief to the narrow and crowded thoroughfare of Ludgate-hill, as it might be if carried along the shore, at least as far as Southwark-bridge; and that part of the plan which provides a foot-path only from Hungerford-market to Westminster-bridge, and proposes to give up the ground there gained from the river as private gardens, is also considered objectionable. Another defect is the imperfect means of communication provided between the embankment and the shore, which will be, like the stations of railroads, convenient only to those living in their immediate neighbourhood. No public communication, for example, is contemplated between Norfolk-street, in the Strand, and Blackfriars-bridge, so that a person may actually live within 300 yards of the embankment, and not be able to approach it without a walk of a mile. The principal termini of the roadway are also considered objectionable; it is to be entered at right angles both at Blackfriars-bridge and Whitehall-place; and the latter opening, instead of one nearer Charing-cross, will be extremely circuitous and inconvenient to the whole of the inhabitants of the northwest of London. Notwithstanding these defects, the projected terrace will be advantageous to the public who use the steamers, as piers will be provided for their landing and embarking, very different from the unsightly and unsafe assemblage of old barges, united by thin platforms of boards, which now encroach so much on the water-way; while, within the line of road, a series of docks will be constructed to provide the needful accommodation for the barges of wharfingers, who will have the same facility of access to their premises as at present, so that it will not be necessary to interfere with private property in any case.

Westminster Abbey.—A letter to the Dean and Chapter of Westminster by a Clergyman has just been published, from which it appears that a plan is in contemplation, which will destroy the appearance of a Cathedral in the interior of Westminster Abbey. It is intended, it is said, to take away the choir, and to throw the whole of the eastern end of the cathedral, choir, and transepts, into a large flat open space, fitted up with congregational sittings like a parish church, for the accommodation of the numerous Sunday congregation. The object of the above letter is to suggest that the addition of the west end of the nave to the present choir, is a far more desirable plan than that of destroying the stalls and other characteristic fittings of a Cathedral, for the purpose of including the transepts in the proposed arrangement.

Damage by Fire in the Metropolis.—A Bill for the better prevention of damage by fire in the metropolis and its neighbourhood, has been brought into the House of Commons by the Earl of Lincoln and Sir J. Graham, Bart. The number of its clauses amounts to 31. Adequate provisions are made for the fixing, &c., of fire-plugs, the supply of water-engines, and convenient access thereto, and other means necessary for the extinction of conflagrations. The fire-engines, &c., are to be paid for out of the poor-rates. Penalties are enacted for the punishment of such persons as may negligently cause fires in the metropolis, and clauses annexed for the carrying on of the legal proceedings which may become necessary under the act. The schedules appended to the bill contain full descriptions of the engines and implements required for the extinction of conflagrations, and the list of rewards to be paid to firemen and others for their arduous and invaluable services. The operation of the bill is limited by clause 3, to all such places lying on the north or left bank of the river Thames, as are within the exterior boundaries of the parishes of Fulham, Kensington, Paddington, Hampstead, Hornsey, Tottenham, St. Pancras, Islington, Stoke Newington, Hackney, Stratford, Bromley, Poplar, and Shadwell; to such part of the parish of Chelsea as lies to the north of the parish of Kensington; to all such parts and places lying on the south or right bank of the river Thames as are within the exterior boundaries of the parishes of Woolwich, Charlton, Greenwich, Lee, Lewisham, Camberwell, Lambeth, Streatham, Tooting, and Wandsworth; and lastly, to all places lying within 200 yards from the exterior boundaries of the district hereby defined. Power, however, is given to extend these limits.

The late Fire in Oxford-street.—On Saturday an inquest was held on the six persons who perished in the fire at the Rose and Crown gin-shop in Oxford-street. The bodies were those of Mrs. Williams, the landlord's wife, his two children and three servants. From the evidence of the principal witness it appeared that Mr. Williams was absent from home, and that he had given the witness directions to fill the gin vats, which he commenced doing about 12 o'clock. He had previously filled some smaller casks, which were ranged round the counting-house, and having neglected to turn the spirit off when these casks were full, shortly after he commenced pumping for the purpose of filling the large vats, the smaller casks overflowed and ran down upon the gas-light. In the course of a few moments he was alarmed by a crackling noise within the counting-house, and on returning to discover the cause he found the whole place in flames. His first step was to run down stairs and obtain some water, hoping to extinguish the fire, but the flames spread with such rapidity as to render his efforts entirely useless, and he then rushed up stairs, whither his fellow servant had before proceeded with a view to alarm those members of the family who had retired to rest. The fire had, however, at this time got so firm a hold of the staircase and adjoining parts of the building, and the masses of smoke which continued to arise were so dense, that he was unable to proceed, and was shortly after dragged out in a senseless state by one of the few persons who entered the house on the first alarm being given. In less than a quarter of an hour the whole house, from the ground floor to the roof, was in flames, and the only individual who managed to effect her escape was the sister of the unfortunate Mrs. Williams, who, on being awoke, ran down stairs, and was assisted out of the first-floor window, from whence she was handed down by some of the neighbours. There appears to be no doubt that all the unfortunate sufferers were aware of the fate that awaited them; and Mrs. Williams was observed by several persons standing at her bedroom window with her hands clasped, apparently imploring assistance. The jury, after a long investigation, returned a verdict of accidental death. The property was insured.

Marriage of an Ojibbeway Indian.—On Tuesday morning Alexander Cadotte, or Notten-akm (the strong wind,) was married to a Miss Haines, daughter of a carver and gilder, residing in George-street, Hampstead-road. The bride was accompanied by her father, mother, brother, and sisters; and the bridegroom was attended by his Indian companions, male and female, dressed in full native costume, which had a most wild and grotesque appearance. A great crowd was attracted to witness the ceremony, which took place at the church of St. Martin-in-the-fields. The party occupied several carriages, the

coachmen of which were decorated with white favours. The intention of Cadotte, who is a half caste, his father being a French Canadian, who was confidentially employed at the period of the late war, is, after having completed his engagements here, to return to his own country with his wife. On quitting the church the crowd, who were unable to obtain admission, set up a loud cheer as the bridal party entered their respective carriages, and the curiosity of the public was so great to catch a glimpse of the married couple, that it was with the greatest difficulty the police were enabled to clear the way for their progress.

The Ancient Roman Wall.—In the course of excavations which are making adjoining Sir J. Cass's charity, to the east of St. Botolph's, Aldgate, the workmen last week came on the foundation of the ancient Roman wall, at a depth from the surface of about 15 feet. It was of the usual strength and width, and built upon a solid brick foundation, strongly cemented together. The bricks were in a condition apparently as perfect as when they were originally laid down. A short time ago another part of the same wall was discovered, at a similar depth, in Duke-street, Houndsditch, from which it appears that it passes across the lower end of Houndsditch, under the burial-ground of the church of St. Botolph. A quantity of fused metal, which is supposed to have been melted in the fire of London, was discovered among the earth. There was a depth of made earth of from 15 to 20 feet, which was of a fine loamy quality. It is supposed that when the Tower-ditch was excavated, a large quantity of the soil was brought there. The same sort of soil is found in many other parts adjoining London-wall, leading to the site where Winchester-house formerly stood. The ground is dug for a sewer, and there is a depth of about 20 feet of made earth.

Accidents.—On Thursday morning a fatal accident occurred at the terminus of the Dover branch Railway, in the Old Kent Road. A building was in progress for the reception of the carriages, about 500 feet in length and 150 feet in width. The roof was of a gable form, and principally composed of iron divided into three compartments, supported on columns of iron 30 feet high, and placed at intervals of 53 feet. The roofing was supported by iron principals resting upon iron girders, and about four feet distant from each other. On the top of the principals were placed a quantity of boards, and upon them a layer of slates. At six o'clock in the morning about 200 men commenced work in various parts of the terminus. Several were engaged in slating the roof, and others in laying the concrete for the foundation of the platforms and tramways of the respective compartments. The men had been at work about three quarters of an hour, when the attention of those below was attracted to the roof by a number of the slates rolling off. They then saw no reason for alarm, but almost immediately the entire roof was observed to swerve slightly to and fro, and they then retreated as fast as possible, calling out to apprise those who were at work on the roof of their danger. Scarcely had this alarm been given, when the roof of two compartments to the extent of from 200 to 250 feet gave way with a tremendous crash, carrying with it all the men who were on it at the time, and burying those who had not time to make their escape from below in the ruins. Many were struck in endeavouring to effect their escape by the falling fragments; one man was killed, and eight others seriously injured. The noise occasioned by the fall of the building was equal to the discharge of a park of Artillery, and so great was the alarm of the inhabitants in the vicinity, that their fear impelled them, in numerous instances, to rush out of their houses in their night-clothes, believing that the noise was occasioned by an earthquake.

City Police.—The Commissioner of the City Police, Mr. D. W. Harvey, has published his report for the past year. Among the multitude of facts which it records, it appears that the number and magnitude of the robberies committed within the city during the year have been much exaggerated, and that the total amount of property actually lost during the past year, valued at the highest rate, is less than 20*l.* per diem. It appears moreover that of the 1229 robberies of all descriptions which occurred in the city during the year 1843 not one amounted to 300*l.* in value; that only six exceeded 100*l.*; 607 not having exceeded 5*l.*; and there being 426 cases of theft under 5*s.* value. The number of persons brought to the station-houses upon charges, and under circumstances too trivial to call for magisterial interference is very great, and largely upon the increase—a fact which Mr. Harvey thinks may be chiefly attributed to the inducements held out to the idle and dissipated to flock to London from remote parts of the country, under the foolish impression—which cannot be too speedily dispelled—that food and lodging are easily and gratuitously to be obtained! In regard to the police it is stated that out of 1068 men only 167 have been dismissed during the last three years, whilst 272 retired to assume superior situations. As regards the expense, it appears that the total cost of the city police is 41,351*l.*, which, including commissioner, officers, and men (in all 543), is 76*l.* per head; whereas the cost of the Marylebone police (181 men) exceeds 112*l.* per head. Mr. Harvey says that if the city police force were reduced to the number originally proposed (300 men), the total cost would be many thousands a year less than at present. The following statistical results are appended:—The strength of the city police force was at the commencement of the new year 538 men, and only 37 were dismissed in the year 1843. The total number of persons taken before the magistrates in 1843 amounted to 4478, against 5002 in 1842; out of whom 540 were offenders against the person, and 1692 against property; of these 4478 2465 were discharged by the magistrates, 1626 held to bail, and 387 committed for trial. In the same year (1843), the total number of summonses was 1467 against 1502 in 1842. The number of lives saved by the police was 41; number of fires discovered by them 182; value of property stolen 8353*l.*, of which 1407*l.* was recovered. Of the robberies committed in 1843, 26 were burglaries, 736 robberies in dwelling-houses, 274 from the person, and 193 in the streets—making a grand total of 1229.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending March 30—West Districts, 149; Northern, 199; Central, 168; Eastern, 227; Southern, 337; Total, 1080. Weekly average for the last five years, 946.

CITY.

Money-Market, Friday.—A memorable event was put upon record on Saturday last in the entry of the day's transactions at the Stock Exchange. After a steady and almost uniform advance that has been a good while in progress, Consols, in which fund are comprised two-thirds of the public debt of England, were officially marked at par, or 100*l.* money for 100*l.* stock. The last time they were at 100*l.* was in 1749, the year after the peace of Aix-la-Chapelle, at which period the amount of the public debt was rather more than 78,000,000*l.* The highest price the Three-per-Cents. ever rose to was in June, 1737, and again in May, 1739, when they attained the high price of 107*l.* Between the years 1729 and the year of the Rebellion, 1745, the Three-per-Cents. were never lower than 89, and for a considerable portion of that period they were above par. Again, in March, 1792, they rose to 97⅛, when the amount of the national debt was 239,350,000*l.* During the period between the peace of Paris, in 1763 (when the amount of the debt was 138,774,000*l.*), and the breaking out of the American war, they fluctuated between 80 and 90 per cent. Towards the close of the American war—namely, in February, 1782, they were as low as 54¼. At the termination of the American war the debt was 249,851,628*l.* In the years 1797-8, in consequence of the great success of the French armies on the Continent, and of the mutiny at the Nore, and of the rebellion in Ireland, together with the failure of the attempt to negotiate with the French Republic, the price of stock became less than it has been before or since that time. In May, and again in June, 1797, the Three per Cents. Reduced were as low as 46¾. In the September of that year the Three per Cent. Consols fell to 47⅜, being the lowest price to which they have ever fallen. Dr. Hamilton, in his work on the national debt, states that they were also at that price in January, 1798. The Three per Cent. Consols have not been under 68 since the latter part of 1820, when they were 67⅞. The highest price the Four per Cents. ever attained was 107½, in August, 1791; and the lowest price was 59½ in January, 1798. The highest price the Five per Cents. ever attained was in August, 1791, when they were 122¼, and the lowest price was in August, 1798, when they were only 69⅞.—Consols closed last evening at 100⅜ for account, Three per Cents. Red. 99¾; Three-and-a-Half per Cents., 103¼; Bank Stock, 200¾ to ½; Exchequer Bills, 74 to 76 p.m.

DECLARATIONS OF INSOLVENCY.—R. Marks, of Union-street, Southwark, and of Liquorpond-street, Bedford-street, victualler—R. Dinham, of Tiverton, Devonshire, out of business—J. Johnson, of Birmingham, retail brewer—E. Gater, of Oxford, milliner—I. Cohen, of Hastings, Sussex, jeweller.

GAZETTE OF THE WEEK.—BANKRUPTS.—J. Powell, jun., of the Quadrant, Middlesex, and also now or late of Birmingham, lodging-house-keeper—T. and J. Walker, of York-road, Lambeth, upholsterers—N. Procter, of Meanwood, Yorkshire, tanner—T. Pearce, of Meaford, Staffordshire, miller.—C. Clack Beech-street, Barbican, haberdasher.—Susan Saunders, Golden square, Westminster, board and lodging-house keeper.

SCOTCH SEQUESTRATIONS.—R. G. Macdonald, Esq., of Clanranald kelp-manufacturer—R. Douglas, of St. Andrew's, blacksmith—R. Millar, jun., of Dundee—W. Anderson, of Dundee, merchant—J. Slight and J. W Nicholson, of Edinburgh, engineers—R. H. and W. H. Fype, of Glasgow ship-chandlers — P. Smyth and Co., Tillicoultry, woollen-manufacturers—G. Thomson, Collace, Perthshire, manufacturer.

Provincial News.

Brighton.—On Saturday, John Lawrence, who was convicted at the late assizes for Sussex of the murder of Mr. Solomon, the chief officer of Brighton, underwent the sentence of the law in front of the county gaol at Horsham. The subscription set on foot for the widow and children of Mr. Solomon already amounts to 1200*l.*, including 500*l.* from the town commissioners, and 50*l.* from her Majesty.

Bristol.—The Bush coach-office in Bristol, where an extensive business had been carried on for, we believe, more than a century, closed last week in obedience to the power of steam, and the absorption of its business in the great vortex of railway travelling.—The following appears in the *Bristol Gazette*, and, if true, is one of the most extraordinary facts of a similar nature on record:—The person, a cattle dealer, who was a minute too late to get on board the despatch boat, by the upsetting of which in a squall, at the New Passage, all who had embarked lately perished, is the same man who, on the 1st September, 1839, was a few seconds behind time to get into the Old Passage boat, which foundered, with a great loss of life.

Croydon.—On Wednesday a new and commodious stock market was opened in this town at the back of the Greyhound Inn, and adjoining the fair field. The old market at the bottom of the town had long been found inadequate, and Mr. John Martin, an old inhabitant, liberally resolved to supply the deficiency by erecting the new market in the centre of the town, and close to the station of the Brighton and South Eastern Railways, thereby giving great facility to graziers from the lower parts of Surrey and Kent to bring their stock to market. The profits of the market from tolls are to be vested in trustees for the benefit of decayed tradesmen of the town.

Ipswich.—The local papers mention another escape of a felon, more daring than the recent ones at Nottingham. Leach Borley, the man who was on Friday last convicted before Mr. Justice Patteson of maliciously setting fire to a barley stack, the property of Mr. Gayford, of Rymer House, and sentenced to transportation for life, was immediately after his conviction conveyed with other prisoners to the van employed in carrying prisoners to the Shire-hall. On the arrival of the van at the jail, the turnkey as usual went to open the door of the van to let out the prisoners, when Borley made a sudden spring from the steps. The governor, who was standing by at the time to receive the prisoners, noticing the spring of the convict from the steps, attempted to grasp his collar, but the rapid motion of the convict prevented his so doing, and, suddenly eluding his grasp, he ran off rapidly in a direction towards Haberden Grounds. Several of the turnkeys attempted to follow him, but the darkness of the night, with the speed of the convict, prevented their coming up with him. No tidings of him have been received.

Leeds.—On Monday night a numerous meeting of the inhabitants of this borough was held in favour of a restriction on factory labour to ten hours per day for women, young persons, and children. It had been contemplated to give a public *soirée* to Mr. Oastler on his liberation from prison, but in consequence of the withdrawal of the Factory Bill, and the substitution of a new measure, it was resolved to hold a meeting instead, in order to ascertain the public opinion on the subject. The Rev. Dr. Hook presided, and Mr. Oastler and several other gentlemen addressed the meeting at great length. Resolutions in favour of the ten hours restriction, and petitions to Parliament, founded upon these, were unanimously adopted.

Manchester.—The course pursued by Lord Ashley in allowing Sir James Graham to withdraw the Ministerial Factory Bill without opposition, has been the subject of considerable observation in Manchester. The Lancashire Central Short-time Committee met last week, when the following resolution was unanimously adopted, and printed for extensive circulation:—"Resolved—That having read Lord Ashley's letter to Mr. Howarth, Chairman of the Delegates in London, explanatory of the course which his Lordship pursued with respect to the withdrawal of the Ministerial Factory Bill by Sir James Graham, this Committee avail themselves of the earliest opportunity to express their entire concurrence in the course which his Lordship has adopted; and, at the same time, beg to assure his Lordship that we place the utmost reliance and confidence in his wisdom, integrity, and ability to conduct this great and important question to a successful and, we hope, a speedy issue; for the accomplishment of which we shall be most happy to render his Lordship every assistance in our power."

Newark.—The once-celebrated post-house, the Clinton Arms, in this town, has ceased to be such; the horses, coaches, &c. were last week sold in consequence of the decrease of road business. The town has now that listless look so general in places dependent upon posting and coach traffic, which has been destroyed by the proximity of a railway and the effects of steam travelling. The inn alluded to had, a few years, ago, 25 to 30 pair of post-horses, besides those required for stage coaches, &c.

Oxford.—Richard Elliott, who described himself as a cigar merchant, residing in Bell-street, Paddington, and who has been in custody since the 18th of last month, on a charge of being concerned with two others, not yet in custody, in robbing the Defiance Oxford coach of 1500 sovereigns, was for the first time publicly examined on Saturday. Several witnesses were examined, but their evidence added little to the facts already known to our readers. After a long examination the magistrates remanded him to a future day.

Rochester.—Mr. John Withers Powell, solicitor, of Canterbury, was last week committed for trial at the next sessions, on two separate charges of felony—namely, with stealing, on the 23d March, three silver teaspoons and a silver table-spoon, from apartments in the house of Mr. Anderson, in this city, in which he lodged; also, with stealing a telescope from the same apartments. The prisoner is respectably connected, and not long ago held the office of coroner for the western division of Kent. As he has lately acted in a very strange way, there is reason to believe that he is insane. The prisoner during the whole of the proceedings was in a highly excited and nervous state. About two years since he was the inmate of a mad-house, from which he escaped, and has since been at large. Two of his former keepers were present, but were not examined. In the course of the examination he remarked, "This is a cheap method of trying a commission of lunacy."

Sheffield.—The local papers mention the explosion of another infernal machine in a private family in this town. It appears that on Saturday morning a tin case loaded with gunpowder was thrown into the bedroom-window of Mr. George Gillott, file-grinder, residing at 197, Granville-street. Mr. and Mrs. Gillott, with an infant, were at the time in bed; but on jumping out he saw the fuse burning, and got his wife and child down stairs as quickly as possible. They had scarcely, however, crossed the lower room, when the explosion took place, shaking down part of the ceiling of the bedroom, and breaking every pane in the window, with other damage in different parts of the house, but none of the inmates were injured. The *Sheffield Iris* adds, that the frequency of these occurrences is rapidly degrading the character of the town.

Wolverhampton.—On Easter Monday, Mr. Cobden, Mr. Villiers, and Mr. R. R. Moore, as a deputation from the Anti Corn-law League, attended a Free Trade meeting in this town. Mr. Barker, a large manufacturer and a borough magistrate, presided; and the meeting was addressed at great length by Mr. Villiers, Mr. Thorneley, Mr. Cobden, Mr. Moore, and other gentlemen. A subscription in behalf of the League Fund was then opened, and 500*l.* were subscribed before the meeting broke up.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1353*l.*; Birmingham and Gloucester, 2024*l.*; Eastern Counties, 3774*l.*; Edinburgh and Glasgow, 2054*l.*; Great Western, 12,640*l.*; Grand Junction, 7332*l.*; Glasgow, Paisley, and Ayr, 1251*l.*; Great North of England, 1266*l.*; London and Birmingham, 15,561*l.*; South-Western, 5303*l.*; Blackwall, 651*l.*; Greenwich, 822*l.*; Brighton, 2657*l.*; Croydon, 243*l.*; Liverpool and Manchester, 4198*l.*; Midland Counties, 2486*l.*; North Midland, 4209*l.*; Newcastle and Carlisle, 1491*l.*; Sheffield and Manchester, 502*l.*—On Saturday a Parliamentary return was issued of all moneys raised under Acts whereby railroad companies have been incorporated, from January, 1826, to January, 1844, distinguishing the sums raised as principal from the sums to be raised by loan or mortgage. The return contains the names of 121 railways, and the titles of no fewer than 250 Acts of Parliament which passed in the years mentioned, under which the moneys were raised. The entire sum was seventy-nine millions twenty-six thousand and three hundred and seventeen pounds! Of such sum, 57,357,735*l.* was capital in joint-stock, and 21,638,582*l.* to be raised by loan or mortgage. The total sum to be raised according to Acts of Parliament by the Arbroath and Forfar Company amounted to 160,000*l.*; the Birmingham and Derby Junction was altogether empowered to raise 1,200,000*l.*; the Birmingham and Gloucester, 1,413,741*l.*; the Bristol and Exeter, 2,000,000*l.*; the Bristol and Gloucestershire, 876,000*l.*; the Whitstable and Canterbury, (a tram-road,) 80,000*l.*; the Cheltenham and Great Western, 2,000,000*l.*; the Chester and Birkenhead, 499,999*l.*; the Chester and Crewe, 458,333*l.*; the Clarence, 799,645*l.*; the Dublin and Drogheda, 600,000*l.*; the Eastern Counties, 2,533,333*l.*; the Edinburgh and Glasgow, 1,500,000*l.*; the Glasgow, Paisley, and Ayr, 1,249,900*l.*; the Leinster and Munster, 1,065,000*l.*; the Great North of England, 1,730,000*l.*; the Great Western, 4,999,999*l.*; the Liverpool and Manchester, 1,832,375*l.*; the Birmingham and London, 5,500,000*l.*; the Blackwall, 1,066,000*l.*; the Brighton and London, 2,820,000*l.*; the Croydon, altogether, 921,333*l.* (the original estimate of Mr. Gibbs, the engineer, having been only 140,000*l.*!); the Greenwich, 993,333*l.* (or nearly double the original capital of 533,000*l.*!); the South-Western, 2,540,000*l.*; the Leeds and Manchester, 3,429,000*l.*; the Manchester and Birmingham, 2,800,000*l.*; the Grand Junction, 800,000*l.*; the Midland Counties, 1,866,333*l.*; the Newcastle and Carlisle, 1,050,000*l.*; the Northern and Eastern, 1,631,288*l.*; the North Midland, 3,400,000*l.*; the South-Eastern and Dover, 3,630,277*l.*; the Sheffield and Manchester, 1,533,000*l.*; and the York and North Midland, 681,666*l.* The above are only a fraction of the whole, but even these will serve to prove the astonishing monetary power and resources of the empire. In some instances (and the Greenwich and Croydon lines may be named amongst others) the original estimates have been enormously exceeded; the latter insignificant line, which is only 10¼ miles in length, having already cost the proprietors nearly a million sterling (or 100,000*l.* per mile), whereas the originally proposed capital amounted to 140,000*l.*—The railway excursions announced in our last for the Easter holidays appear to have received their due share of patronage. From Monday to Wednesday 5720 availed themselves of the excursion to Brighton by the railway to that town, and 13,454 travelled by the Eastern Counties line, which appears to have been the most popular of all the metropolitan railways; the passengers to Dover and Folkestone amounted to about 1270, the greater distance at this season having doubtless operated as a discouragement.—It is intended to open the railway from Darlington to Newcastle on the 13th of June, after which there will be an uninterrupted railway intercourse between Newcastle-upon-Tyne and London.

IRELAND.

Dublin.—The weekly meeting of the Repeal Association, usually held on Monday, has been postponed for a few days, in consequence of Mr. O'Connell and the leading members of the Association having left town to attend the Repeal dinner at Cork. The counsel for the traversers on the state trials were to hold a consultation in this city on the 12th inst., previous to the opening of Easter Term, on Monday next.—There is an increase of 20,804*l.* in the customs receipts, and nearly 1400 in the number of documents passed per warehouse goods, in the port of Dublin, in the present quarter, over the corresponding quarter of last year; the sums received for the several quarters being, 1843, 218,162*l.*; 1844, 238,966*l.* There is a falling-off in the consumption of tobacco, and an increase in that of tea, sugar, and coffee—a fact which speaks favourably of the improved habits of the people.—Lord Eliot's Enfranchisement Bill has not been received in Dublin as a boon. The Repeal Association has already issued a protest against it, calling it a "most afflicting measure," and requesting the Irish members to give it the most decided opposition by all means known to the constitution of Parliament, however vexatious those means may be called.

Cork.—On Monday a public dinner was given to Mr. O'Connell in this city, Mr. Smith O'Brien in the chair, supported by the mayors of Cork, Limerick, Waterford, Clonmel, and Kilkenny, by the following M.P.'s—Mr. Callaghan, Sir D. Roche, Mr. Powell, Mr. Meagher, and Mr. Roche, and by about 800 other gentlemen. Mr. O'Connell, in responding to the toast of his health, spoke at great length on the present state of the Repeal question, and alluded in the following terms to his expected imprisonment:—"Why did they wish to have me in their power? They thought to put an end to agitation. (Cries of 'Never.') I like that 'never'—no, never. No, never whilst our grievances exist—while the union remains unrepealed. They expected that there would be some submission if they managed to have a verdict. I am advanced in life—the prison may terminate my existence. (Cries of 'No.') Oh, it may. (No, no.) Why do you say no? I do not shrink from it. I do not say so in pitiful bewailing. I came here to proclaim to the province of Munster, and from this I will send my voice to the utmost limits of the northern, and to the eastern and western provinces—I came here to read you a lecture—I am here to instruct you in your duty—not merely to tell you how deeply I am indebted to you. I came here to tell you, and universal Ireland, that it would be the idlest thing in the world not to think that I would go into prison. I am as sure as that any man hears me here that I will go into prison. (Several voices, 'You sha'n't.') Oh, that is folly. You say I sha'n't—I say I must: I do not say I will, but I say I must, for others command. Any man who imagines that the Ministry will relax—who really seriously entertains a doubt on the subject—does not possess the faculties which I am glad to see possessed by those whom he had the honour to address. Then take it for certain that the sentence will be executed, and take this for a consolation, that they may imprison me—that they may confine my person, but they will not deprive me of a single pleasurable sensation. There is no horror in confinement for a man who was working for forty years for Ireland. I am only astonished that they put me in gaol after forty-four years, and that they did not commence by doing so."—The trial of Mr. Delany, and Thomas and Denis Carroll, for the murder of Dr. Quarry on the 4th Nov. last, the particulars of which were given in our Paper at the time, was concluded last week. The Jury returned a verdict, finding Thomas and Denis Carroll not guilty of murder, but guilty of an aggravated manslaughter; and George Foster Delany guilty of manslaughter, with an earnest recommendation to mercy, upon the ground of his previous excellent character for humanity. The Judge sentenced the two Carrolls to transportation for seven years, and Mr. Delany to twelve months' imprisonment.—The inhabitants of Cork seriously contemplate a railway from that city to Limerick, and to connect themselves with the Cashel line through Limerick. It would make the route to Dublin only 13 miles longer than by a direct rail to Cashel.

Tipperary.—Two other convictions for murder have taken place at these Assizes. The first was that of Thomas Wade for the murder of Patrick Ryan Morgan, at Cummer Hunt, in 1842. The prisoners' two brothers, John and Patrick, were also arraigned, but having refused to join in their challenges with their brother, they were set aside for the present. The murder arose out of a dispute about land. The crime was proved by the evidence of an accomplice, whose direct evidence was conclusive of the prisoner's guilt. The witness however admitted that he himself struck the finishing blow, which deprived their victim of his life. The cross-examination of this miscreant elicited some horrifying particulars respecting his previous mode of life, and the cool indifference with which the commission of the most atrocious crime is treated in this district. The second case was that of John Hickey, Martin Ryan, and Martin Casey, for conspiring to murder James Hanley, which occupied two days. The verdict returned was, Casey and Ryan not guilty; and John Hickey, guilty.

King's County.—In consequence of a memorial to Government, a reprieve for a week was granted a few days ago, in the case of Thomas Dowling, who was under sentence of death at Tullamore, for the murder of Mr. Gatchell, a magistrate and land agent in the King's county. The result of the memorial, and the preliminary inquiry, in this extraordinary case is, that Government has forwarded another reprieve for a month, to afford time for further inquiry. It is asserted that a brother of the approver, and not Dowling, was the actual murderer, and that he has fled to America. It appeared in the evidence for the prosecution, that Dowling and his family had been utterly ruined by the proceedings for the enforcement of rent adopted against them.—In the case of Jubee, the soldier, convicted at the same assizes for the murder of Adjutant Mackey, the Government decided that the law must take its course, and he was executed on Wednesday.

SCOTLAND.

Edinburgh.—James Bryce, who after a trial of two days (the 12th and 13th ult.), before the Court of Justiciary, was convicted of the murder of his brother-in-law, was executed at the usual place of execution in this city on Wednesday last. He was in a state of pitiable exhaustion when placed on the drop. Notwithstanding a drizzling rain descended, and a raw wind blew during the morning, an immense multitude came from the neighbouring country, and the place of execution was surrounded by an anxious crowd as early as six o'clock.

Glasgow.—A fortnight since, during a performance at the Glasgow Theatre, a false alarm of fire was raised, which so terrified the audience that they made a rush to the doors, and the panic becoming general, several persons were severely injured, and one has since died.

Miscellaneous.

Colonel Stoddart and Captain Conolly.—Captain Grover has received Dr. Wolff's journal up to the 6th February. He left Tabrees on the 20th January, and after a perilous and painful journey, reached Tehran in perfect health, on the 4th February. Fifty-six miles from Tehran, he was obliged to write to Colonel Shiel, petitioning that five horses might be sent to his assistance. Colonel Shiel instantly sent the required horses, and wrote in the kindest terms, inviting the doctor to take up his quarters at the British embassy, and promising every assistance. The doctor says:—"Could anything be more kind than this? He (Colonel Shiel) has also detained in his house, Meshede Rajab, who was three years servant to Colonel Stoddart, and by whom he (Meshede Rajab) was sent to Cabul. He had been imprisoned at Bokhara. I have taken him into my service, and he will accompany me to Bokhara in about ten days' time. I have met with the greatest kindness and hospitality from Colonel Shiel and the gentlemen attached to the embassy, and I wish this to be understood in the strictest sense of the word." Dr. Wolff further says:—"Colonel Shiel told me that he had seen the ambassador from Bokhara, who told him that he did not believe that Colonel Stoddart and Captain Conolly had been killed, but that they were kept in prison." Dr. Wolff had seen Count de Medem, the Russian envoy, and received from him an account of his interview with the ambassador, which differed but little from that published some time ago in the papers. The doctor has not yet been to visit the Bokhara ambassador, as he wishes previously to be presented to the King of Persia. Dr. Wolff says Colonel Stoddart's servant told him that "people had been frequently confined for five years in prison at Bokhara, and believed by all the inhabitants to have been killed, and then suddenly had made their appearance again." The doctor then says:—"So much is certain, that no one at Bokhara has witnessed the execution of Stoddart or Conolly, and my determination, therefore, of going straight to Bokhara is unshaken and unabated. I shall now begin to draw money on Drummond's in good earnest, for I must appear respectably at Bokhara as the great mullah from England, described by the Sultan and the Sheik-ul-Islam, but as the mullahs among the Muhammedans live with great simplicity, I shall do the same. I shall not neglect to make search for the other British officers at and near Bokhara, and every sepoy I might pick up." The King of Persia evinces the kindest zeal. He has already written to the Ameer of Bokhara, claiming these unfortunate men as British officers of distinction, and urging the Ameer to send them immediately to Tehran, with all the honours due to their exalted rank. His Majesty has also ordered a Mehmaudah to accompany Dr. Wolff to the Bokhara territory, and we may now confidently expect that the fate of these officers will not long remain a mystery.

French Antiquities.—A man, in digging a trench at Pagny-sur-Moselle, a short time back, struck on an earthen vase (which was unfortunately broken), containing 2400 medals of the thirteenth and fourteenth centuries. Some are smaller than the rest, and bear the figure of a bishop wearing his mitre. On the other side is a cross, with some characters around. On the larger ones, on one side is a number of heraldic signs, and on the other a large cross. On some may be seen the words *Signum Dei vivi*, and on some of the smaller "I. O. H.," the initials of Jean d'Apremont, Bishop of Metz. Amongst those pieces were found eleven struck with the effigy of John Count de Maine, afterwards King John of France, made prisoner at Poictiers; six pieces of St. Louis; six of Jean d'Apremont, Bishop of Metz in 1227; and two of Jacques de Lorraine, Bishop of Metz in 1239.—A discovery highly interesting to the antiquary has lately been made in the middle of an extensive forest, near Saint Saulge, about five leagues from Nevers. It is the ruins of an entire Gallo-Roman town, a temple, and other buildings, squares, and many streets. Every day vases of different materials, statuettes, fragments of larger statues of fine execution, and other remnants of value are daily turned up.—*Galignani.*

Desirable Investments.—The *Courrier Français* announces that a joint-stock company has been formed in the department of the Seine-et-Oise for the destruction of rats. The following is an extract from the deed prepared by. M. Baget, a notary at Nauphle-le-Château, and registered on the 17th December, 1843:—"M. Charles-Adrien Paris, a destroyer of rats, residing at Nauphle-le-Château, and M. Edine Frege, likewise a destroyer of rats, residing at Paris, have established between them a company in their joint names for the destruction of rats and mice, to extend to all France." The name of the company is "Paris and Frege," to continue 20 years from the 17th of December, 1843. Capital, 500,000f. (20,000*l.* British). *La Réforme* publishes the prospectus of a new joint-stock company, established at Paris, under the title of "The Solicitude: an Establishment for Insurance against Idleness and Misery."

Canal of the Pyrenees.—A project has been brought forward by Mr. Buck, the Civil Engineer, for cutting a "canal of the Pyrenees" to connect the Mediterranean with the Atlantic, and avoid the circuitous route by the coast of Spain. The plan, as it at present stands, was first matured by M. Galabert, member of the French Chamber of Deputies. The French Legislature granted to a company that was to carry it into execution the property in perpetuity in the canal, with several other advantages, but required a deposit of 3,000,000f. until the act was passed. The subscriptions were completed, and the company was in active operation. In consequence of this deposit not having been made, the grant has remained subject to forfeiture, but nevertheless the scheme has not been abandoned, and the notion exists of raising capital in England.

Law.

ASSIZE INTELLIGENCE. WESTERN CIRCUIT, TAUNTON.—*Parricide.*—It having been known that Monday had been fixed for the trial of the *Sealeys* for the murder of their father, the most intense anxiety was manifested at an early hour of the morning to obtain a seat in the hall. Long before the Court was formally

space, every nook and corner of it was filled by the eager multitude, and hundreds remained outside unable to get within the doors. At the time the Judge went to the Court, it was almost a matter of danger to get through the crowd, so resolutely was every one striving to get near the door. On the prisoners pleading, their counsel stated that he intended to separate in his challenge for them, and thus force the prosecutor to try the prisoners separately. No opposition was offered to this course, and *Mary Sealey* was removed from the dock, and the case proceeded against *Faith Sealey* alone. The numerous witnesses for the prosecution were then called: those first called gave evidence to prove that the body of W. Sealey, the father of the prisoner, which had been buried, was after the lapse of about nine months from suspicions awakened dug up, and the stomach conveyed for analysis to Mr. Herapath, of Bristol. Mr. Herapath then deposed to the facts ascertained by his analysis of the body, and proved that the old man died from the effects of yellow sulphuret of arsenic, commonly called orpiment. After a powerful address from the prisoner's counsel, Mr. Justice Wightman summed up, and the Jury returned a verdict of *Not guilty*.—The same intense interest which was manifested on Monday was exhibited again next day. Upon the sitting of the Court, Mr. Carey on behalf of the prosecution, stated to the Judge that they should, after the verdict of Monday offer no evidence against Mary Sealey for the murder of her father. She was therefore arraigned upon that charge and an acquittal taken. She was then arraigned upon a charge of murdering her aunt, Elizabeth Sealey. Mr. Carey opened the case at considerable length, and called numerous witnesses. It was proved that the old woman was found seated on her chair quite dead, with marks of violence on her throat, which left no doubt on the mind of the medical man that she had been murdered by strangulation. It was shown that the two houses of the prisoner and the deceased were adjoining, a room of the prisoner's house being over a room of the deceased's. The houses were very old, and in the room of the prisoner's house a part of the floor was loose, and a board would come up leaving a hole into the room of the deceased sufficiently large to admit of a person getting through. It was proved that the prisoner stated to various persons that she had taken up this board on the day of the old woman's death, and a bottle taken from the old woman's room was found in the prisoner's box. It was also proved that while in prison she had confessed to the laundress that she had destroyed her aunt because when old people came to that age they ought to die! and that she had stated to other persons in the gaol that the old woman was too strong for her, that she had murdered her, and that blood had spurted upon her gown. This gown was produced with the marks of blood upon it. After a long and patient summing up, the jury, to the astonishment of all in court, returned a verdict of Not Guilty! The trial lasted all day, and the fury of the mob in the street was so great that the police were obliged to keep the prisoner in gaol, lest she should be subjected to summary vengeance by the people.

NORTHERN CIRCUIT, LIVERPOOL.—*Rishton, Demandant*, v. *Nesbit, Tenant*.—This was the trial of a writ of right, which had been long pending, the proceedings having been adjourned from time to time, partly in consequence of the slowness of this ancient form of action, and partly on account of mistakes originating in the difficulty of ascertaining the proper mode of carrying on the suit, occasioned by the almost entire disuse of this form of action, which indeed was abolished by the Legislature some years ago, saving such suits as had been then commenced, of which this was one, and at this time the only one in the kingdom not disposed of. It will, therefore, be the last of the kind which can occur. At a former assize four knights, girt with swords, appeared in court, and, being first sworn, chose 12 jurymen, in this form of action called compurgators, to try the case. The proceedings were then adjourned. On Thursday, the 4th, the four knights, Sir T. Brancker, Sir T. Potter, Sir G. Drinkwater, and Sir J. Walmesley, appeared and took the seats appointed for them. The compurgators were then sworn to try which of the parties had the better right to the lands and hereditaments in dispute, and also the other issues joined in the cause. Mr. Starkie then tendered a demimark (6*s*. 8*d*.) to the demandant. A question then arose as to which of the parties had a right to begin, and several old authorities were consulted. The Judge decided that as the tenant was to maintain his right, he must begin, and show his title to the land. Mr. Starkie then, on behalf of the tenant, stated the case. It appeared from his statement that the reason of the present proceeding was founded on one of the now repealed statues of limitation, which allowed a person to recover lands at any time within 60 years of adverse possession by another who had not so good a title as the demandant. In the year 1734 a Thomas Minshull was possessed of a considerable quantity of land, situate in Chorlton-upon-Medlock, with a mansion-house, called Chorlton-hall, with its grounds and gardens, comprising between 50 and 60 acres, and it might be one question in the cause by what kind of an acre the quantity was to be estimated. On the 9th of December in that year Thomas Minshull devised the property to his wife Barbara for life, with remainder to his son Thomas Samuel Minshull in fee. Thomas Samuel died without issue, having devised the land to several tenants for life, with remainder in tail, with a final remainder in fee to his mother Barbara, her heirs and assigns for ever. It so happened that all the tenants for life and in tail died in the lifetime of Barbara Minshull, who became therefore seised in fee of the premises. She married a Scotchman, who was in the army, named Roger Aikin, commonly known by the name of "Spanking Roger." In 1770 a fine was levied by Mr. Aikin and "Spanking Roger," and a deed was executed declaring the fine should enure to such uses as Roger should appoint, and subject thereto to him, his heirs and assigns for ever. "Spanking Roger" soon exercised the power thus conferred upon him by mortgaging the estate repeatedly, till the charge amounted to many thousands of pounds. It being necessary to provide for the payment of these mortgages, a new one was made, and therefore another fine was levied. Subsequently to that the estate was conveyed to trustees to sell and pay the mortgages. At that time building was begun upon it. The trustees sold parts, and re-conveyed the residue to Roger Aikin in fee discharged of encumbrances. He had then retired to an estate in Scotland, and sold the residue, which was becoming more and more valuable as building land, to William Cooper, Samuel Marsden, Peter Marsden, and George Duckworth, for 42 years. In 1808, a deed of partition was executed between these four parties, by which each held his share in severalty. It was this land, now covered with numerous houses, which was said to be now worth upwards of a million of money, that the demandant sought to recover. The two material questions to be tried were—1st, Was any title which the demandant might otherwise have barred by the fines or either of them? and 2nd, if not so barred, could he trace his pedigree from Barbara Minshull, who afterwards married "Spanking Roger," so as to make himself her heir-at-law? As to the first of these questions, it was said that the number of acres mentioned in the fines was not sufficient to cover all the property. On this he should submit, that as the lands were in Lancashire, they were to be reckoned at the rate of Lancashire acres, which, speaking in round numbers, were as 8 to 13. He then quoted some cases to show that where there were fines of lands in a county using a customary measure, the measure of the county, and not the standard of the realm, was the quantity to be taken. Besides, the part which the demandant now claimed was in the midst of the property, and it could not be intended that a part so situate was not comprised in the fine. If any part was omitted, doubtless it would be some outer piece, and not a part surrounded by that included in the fine. As to the second point, he should trace the pedigree, so as to show that the Barbara Minshull who married "Spanking Roger" could not be the heir of that person, but was sprung from another person, not related to the family, and he felt confident that he should defeat the claim of the demandant, which, indeed, if affirmed, would be very hard upon those who had paid so much money for, and spent so much in improving, the estate. The will of Thomas Minshull was then put in, and the other wills and deeds, so as to trace the title to the present possessors. That being done, Mr. Starkie next proceeded to prove the pedigree, the details of which consisted, as is usual in such cases, of registers of marriages, births, and deaths, and the evidence of old persons connected with the family. This proceeding occupied the Court till 5 o'clock. At the close of the tenant's case, Mr. Dundas stated that he had carefully watched the case throughout, and that he must now admit that he was not able to establish one in reply. A verdict was accordingly returned for the tenant.

NORFOLK CIRCUIT, BURY ST. EDMUND'S.—*Frederick Borley* was indicted for setting fire to a building in the occupation of Mary Rust. The first count of the indictment described the building as an outhouse, the second as a warehouse. It appeared that the building which the prisoner was accused of setting on fire stood in a hop-ground belonging to the prosecutrix, and could be seen from her house, but it was unconnected with any of the buildings attached to the house. Mr. Justice Patteson was of opinion that the destroyed building was neither an outhouse nor a warehouse within the meaning of the statute on which the prisoner was indicted. With respect to the former term, it had long been settled that in order to constitute an outhouse it must be connected with a dwelling-house, and in some respects parcel of it. This building was a solitary and unconnected erection, and could not be called an outhouse within the meaning of the act of Parliament on which this indictment was framed. Neither was it a "warehouse;" to come under that denomination the building must be such as factors or traders kept their goods in for sale, and where customers went for the purpose of viewing them, and not such as were used for the safe keeping of goods merely. In this case the building was not even used for the safe keeping of goods. He was therefore of opinion that the prisoner must be acquitted. The jury accordingly found the prisoner Not Guilty.—*Arthur Hammond* and *Robert Berry* were indicted for feloniously shooting at Thomas Firmin, with intent to do him some grievous bodily harm, or with intent to resist their lawful apprehension. The prosecutor is under-gamekeeper to Mr. Browning, who hires the right of shooting in an extensive wood, called the Hyde, near Bury, of which Sir T. Gage is the owner, and a Mr. Brown the occupier. The prisoners are labourers living in Bury, whose labours, however, appear to be pursued by night rather than by day, being persons given to the offence of poaching. The Jury Acquitted Hammond, and found Berry Guilty of an assault only, and thereupon sentenced him to six months' imprisonment.—*Leech Borley* was indicted for setting fire to several barns and stacks of corn, the property of John Gayford. The prosecutor is a tenant of the Duke of Grafton, under whom he occupies a large farm at Rymer's-point, in the parish of Trowston. The prisoner in November last was a labourer in the parish of Sapston, a village distant four miles from Trowston. He had been some weeks absent until the night of Sunday, the 19th of November, when he was seen in the neighbourhood of Rymer's-point about the time of the fire, having previously told one of the witnesses that the premises of Mr. Gayford would be fired that night. In addition to this evidence, a convicted felon, who was in the gaol with the prisoner, deposed to a circumstantial confession which he said the prisoner made to him. The Jury found the prisoner Guilty, and he was sentenced to be transported for life.

CENTRAL CRIMINAL COURT.—THE WILLS FORGERIES.—On Thursday morning, Mr. Justice Williams, Mr. Baron Gurney, and Mr. Justice Maule, took their seats on the bench, and the prisoners, *Wm. Henry Barber*, *Joshua Fletcher*, and *Georgiana Dorey*, were placed at the bar, to take their trials for these forgeries. The abstract of the indictment was then read. It contained several counts, and related to the forgery of a bond of administration to obtain possession of certain stock once the property of John Stewart, gardener, at Old Marlow, Bucks, deceased. The first count charged the forgery of the said bond to one Susanna Richards, also deceased, and laid the intent to be to defraud the Archbishop of Canterbury, as head of the Prerogative Court. It charged the prisoners Barber, Fletcher, and G. Dorey, with being concerned as accomplices in conspiring and uttering the said forged bond, and obtaining the amount of the moneys which stood in the name of John Stewart, to the credit of the Commissioners for the Reduction of the National Debt. The second count was similar to the first, with the exception that it laid the intention to defraud the Governor and Company of the Bank of England. The third count laid it to defraud the Right Hon. Charles Shaw Lefevre, and others the Commissioners for the reduction of the National Debt for the time being. The fourth to defraud the next of kin, the heirs, administrators, and assigns of the said John Stewart. The Attorney-General then addressed the Jury on the facts of this case which he had selected to commence proceedings, the case of Miss Slack being postponed to await the issue of the present trial. The learned counsel entered at great length into the particulars of the case; but it is impossible to find space to follow him through his minute and elaborate statement, or to give an account of the evidence in support of it. This is, indeed, the less necessary, as all the leading facts have already been laid before our readers, in the reports we have given from time to time of the Examinations at the Mansion House. After sitting the whole day, Baron Gurney said it was impossible to conclude at one sitting, and the Court adjourned. The trial was accordingly resumed yesterday, when the case for the prosecution was brought to a close. The evidence was given at great length, and a confession made by Mrs. Dorey was read, stating that it was about 14 or 15 years since she became acquainted with Fletcher; he and his wife were partial to her, and they introduced her to Mr. Stokes, who afterwards solicited her to go to the Bank, where she signed her name, for which she got 50*l*. They then went to Fletcher's and gave the money to her mother; she remained friendly with Fletcher for some time. Fletcher induced her to commence a trial against Tailor for breach of promise of marriage. After exchanging visits, Mr. Fletcher said he could get money for her at the bank, but he did not say how. She said she would do as he wished her. He then related how he could procure the money from the Commissioners for the Reduction of the National Debt, by representing himself to be the representative of some deceased person, who had left unclaimed stock at the bank. At the close of the prosecutor's case Baron Gurney said that as there was no chance of the trial concluding that night the Court must adjourn to the next day.

SPORTING.

NEWMARKET CRAVEN MEETING.

MONDAY.—*The Craven Stakes*, of 10 sovs. each, for three-year-olds, 6 st; four, 8 st 4 lbs; five, 8 st 13 lbs; six and aged, 9 st 5 lbs. A.F. (8 subs.) Mr. Boyce's Corranna, 5 yrs, beat by a head Mr. Ford's bl. c. by Ion, out of Mary Ann, 3 yrs. The following also started, but were not placed:—Mr. Day's St. Lawrence, aged; Mr. Crockford's Pineapple, 4 yrs; Mr. Ford's Spiteful, 4 yrs; Lord Exeter's f. Mocha, by Liverpool, out of Mecca, 3 yrs; Mr. Watt's Voltri, 3 yrs; and Lord Orford's ch. c. by Ratcatcher, out of Turquoise, 3 yrs. Voltri carried 3 lbs over weight.—*Handicap Sweepstakes*, of 20 sovs. each, and only 5 ft. if declared, for 3 and 4 yrs old. D.M. (10 subs.; one declared) Lord Albemarle's The Brewer, 4 yrs, 8 st 8 lbs, beat by a length Mr. Ford's c. by Ion, out of Mary Ann, 3 yrs, 6 st 10 lbs; Colonel Wyndham's Tom Thumb, 4 yrs, 8 st 4 lbs; Duke of Portland's f. by Beiram, out of Souvenir, 4 yrs, 8 st 6 lbs; Mr. Osbaldeston's Shocking Mamma, 4 yrs, 8 st; Mr. Watson's Antidote, 4 yrs, 9 st; Lord Exeter's Czar, 4 yrs, 7 st 12 lbs; Lord Miltown's Birdeen, 4 yrs, 7 st 7 lbs; and Lord Exeter's c. by Beiram, out of Agnes, 3 yrs, 6 st 4 lbs.—*Handicap Sweepstakes*, of 25 sovs. each, 10 ft. T.Y.C. (7 subs.) Lord Bentinck's African, 5 yrs, 7 st 6 lbs, beat by a length Colonel Peel's Garry Owen, aged, 8 st 12 lbs; Lord Exeter's Franlein, 4 yrs, 7 st; Duke of Bedford's Curry comb, aged, 7 st 1 lb; and Mr Payne's Cecil, 6 yrs, 6 st 10 lbs.—*Sweepstakes*, of 50 sovs. each, for three-year old colts, 8 st 7 lbs; fillies, 8 st 4 lbs; not engaged in either Riddlesworth, 2000 guineas, or 1000 Guineas Plate. D.M. (9 subs.) Mr. Crockford's Rattan beat in a canter by 2 lengths Lord Albemarle's Delapre, Lord Exeter's Crosby, Mr. Ford's Sir Diggory Diddle, Lord Orford's c. by Clearwell out of Niminka, Mr. Osbaldeston's Escrick, Mr. H. Vane's The Blusterer, and Colonel Wyndham's Numskull.—*The Riddlesworth Stakes*, of 200 sovs. each, h. ft., for three-year-old colts, 8 st 7 lbs, and fillies, 8 st 4 lbs. Ab.M. (6 subs.) Mr. Thornhill's Elemi walked over. *Matches.*—200, h. ft. T.Y.C. Duke of Bedford's Espoir, 9 st 7 lbs, received forfeit from Lord Glasgow's f. by Sheet Anchor, out of Canada, 6 st 7 lbs.—100, h. ft. A.F. Lord Maidstone's Larry M'Hale, 8 st 7 lbs, beat Lord Glasgow's Deerslayer, 8 st 7 lbs.—Lord Stradbroke's Evenus, 8 st, beat Lord Miltown's Scalteen, 8 st 6 lbs; 200, h. ft.; Cambridge-shire course, in a canter by three lengths.

TUESDAY.—*The Oatland Stakes* of 50 sovs, h ft, and only 10 ft if declared, &c. D.J. 7 subs, four of whom declared. Lord Exeter's Maria Diaz, 4 yrs, 6 st 8 lbs, beat by a head, Lord Glasgow's Give Him a Name, 6 yrs, 7 st 5 lbs; and Col. Peel's I am not aware, aged, 7 st 3 lbs.—*The Riddlesworth Stakes* of 200 sovs each, h ft; for three-yr-old colts, 8 st 7 lbs, and fillies, 8 st 4 lbs. D.M. Untried mares or stallions allowed 3 lbs; if both, 5 lbs. 13 subs. Colonel Peel's Orlando, by Touchstone, 8 st 2 lbs, beat by a length Mr. Watt's Baveno, by Bay Middleton, 8 st 2 lbs; and Lord Exeter's Cloak by Rockingham, 8 st 4 lbs.—*Sweepstakes* of 200 sovs each, h ft; for three-yr-old colts, 8st 7 lbs; and fillies, 8 st 3 lbs; those by stallions or out of mares which had not produced a winner before the 4th of April, 1840, allowed 3 lbs. D.M. 7 subs. Mr. Thornhill's br f Example, by Emilius, beat by a head Lord Stradbroke's Boarding-school Miss, 3 lbs; and Mr. Greville's Jamaica, 3 lbs.—*Match.*—B.C. 60, 40 ft. Lord G. Bentinck's Bramble, 8 st 7 lbs, beat Lord Maidstone's The Castor, 8 st 7 lbs, by nearly 20 lengths.

WEDNESDAY.—*The Burghley Stakes* of 100 sovs. each, h ft; for colts, 8 st 7 lbs; and fillies, 8 st 3 lbs, foals of 1841. D.M. 7 subs. Mr. Payne's c by Touchstone, out of Vat, beat by a length Lord Albemarle's Robina by Liverpool, Duke of Bedford's Panther by Liverpool, Mr. Crockford's c by Bentley, out of Emma, and Mr. R. Watson's b c by Lamplighter, out of Tigress.—*Match.* D.M.; 200, h ft; Lord Glasgow's f by Retainer, out of Purity, 7st, beat Mr. Payne's Mania, 8 st 13 lbs, after a fine race by a head.—*Subscription Plate* of 50*l*.; for three-year-olds, 7st., four, 8st 7 lbs; five, 9st; six and aged, 9st 2 lbs.—Duke of Bedford's Oakley, 6 yrs, beat in a canter Duke of Rutland's Cowslip, 4 yrs, and Col. Wyndham's Master Henry, 3 yrs.—*The Column Stakes* of 50 sovs. each, h ft, for three-year-olds: colts, 8st 7 lb; and fillies, 8st 4 lb, &c. (6 subs.) Colonel Peel's Orlando by Touchstone (m. untried) walked over.

FRIDAY.—*The Port Stakes.*—Lothario beat by a head Phlegon, Murat, Gaper, and Fakeaway.—*The Handicap* was won by Garry Owen, beating Canton and three others.—*Matches.*—Minotaur beat Audrey; Espoir beat Pergularia, and Extempore beat Ma Mie.

BIRTHS.—On the 2d inst., at Southampton-row, Russell-square, Mrs. A. TOULMIN, of a son—4th inst., in Guildford-st., the lady of J. BLOGG, Esq., of a son—4th inst., at 75, Upper Seymour-street, Euston-square, Mrs. TAYLOR, of a son—4th inst., at Reading, the lady of Maj.-Gen. TICKELL, C.B., Bengal Engineers, of a son—4th inst., at Chester, the lady of Sir EDWD. WALKER, of a son—5th inst., at 13, John-street, Berkeley-sq., Mrs. H. SURMAN, of a son—8th inst., at Kilburn, Mrs. E. HODGKINSON, of a daughter—5th inst., at Henlow, Bedfordshire, the wife of A. STUART, Esq., of a daughter—6th inst., in Montague-place, Bryanston-square, the lady of H. P. GIPPS, Esq., of a son—6th inst., at Gordon-place, Tavistock-square, the lady of J. FENTON, Esq., of a son—6th inst., at 5, St. John's-terrace, Park-road, Stockwell, the lady of the Rev. A. WALBAUM, of a daughter—6th inst., in Doughty-street, Mecklenburgh-square, Mrs. H. M. BAGSTER, of a daughter—6th inst., in Oxford-terrace, the wife of W. G. CHAPMAN, Esq., of a son—6th inst., at Bedford, the lady of the Rev. C. BRERETON, of a daughter—7th inst., at Wall, near Lichfield, Mrs. W. MOTT, of a son—8th inst., the lady of W. T. HOOPER, Esq., East India House, of a daughter—8th inst., at Wimbledon, Mrs. W. STOTON, of a daughter.

MARRIED.—On the 6th of February, at Chitivalsah, near Bimlipatam, East Indies, T. P. MOORE, Esq., of the 22d Regiment Madras Native Infantry, second surviving son of the late George Moore, Esq., Madras Civil Service, to JESSIE YOUNG, eldest daughter of M. Young, Esq., Eskside, Musselburgh, North Britain—21st Feb., at the Cathedral, Bombay, A. TOD, Esq., 42d Reg. Madras Army, only son of the late A. Tod, Esq., of the Bengal Civil Service, to SARAH O. RICHARDSON, third surviving daughter of the late Captain Richardson, of the Indian Navy—6th inst., at St. Mary's, Lewisham, F. J. PERCEVAL, Esq., to EMMA GILBERT, eldest daughter of the late R. Gilbert, Esq.—9th inst, at Brighton, Sir J. D. PAUL, Bart., of Rodborough, Gloucestershire, to ELIZABETH, youngest daughter of the late Samuel, Lord Bishop of St. Asaph—10th inst., at Marylebone

DIED.—On the 24th Jan., in camp at Gwalior, A. MACQUEEN, Esq., M.D, of her Majesty's 3d Foot, son of the late D. Macqueen, Esq., of Corrybrough, Inverness-shire, making the 5th son of that family who has fallen a sacrifice to military service—11th Feb., at Mangalore, at the residence of his brother, Capt. FERRIER, of Dorset-place, Dorset-square—12th Feb., at Calcutta, of a severe brain fever, at the residence of Capt. F. H. Moore, Lieut. J. W. H. POWNALL, aged 27—24th Feb., at Havannah, T. GELDART SIMPSON, youngest son of T. Simpson, Esq., of Lonsdale-square, Islington, aged 27—2d inst., at Cainscross, Gloucestershire, ELIZ. UWINS, wife of the Rev. J. G. Uwins, and eldest daughter of J. Blower, Esq., of Lincoln's Inn-fields—4th inst., at Clifton, ARTHUR E. PARR, second son of T. C. Parr, Esq., aged 2 years and 4 months—5th inst., at Finchley, Lieut.-Gen. A. SALVIN, late of the county of Durham, aged 86—5th inst., a Highbury, Mrs. PERCIVAL, widow of the late R. Percival, Esq. of Lombard-street—5th inst., at Walworth, C. D. KENDALL, aged 32—At his seat in Dorsetshire, General J. MICHEL, aged 79—6th inst., A. BROOKSBANK, Esq., of Bermondsey, aged 62—7th inst., at Ventnor, Mr. C. DIX, third son of the late Rev. J. Dix, of Canterbury—8th inst., at Clapham-common, J. SALTER GIBB, youngest son of the late A. Gibb, Esq., of Russia-row, Milk-street, aged 17—8th inst., at Hemel Hempsted, SUSANNA GROVER, wife of C. E. Grover, Esq.—8th inst., at Maidstone, MARY KNOWLES, relict of the late J. Knowles, Esq., of Wanstead, Essex, aged 84—8th inst., at Buckingham-place, Fitzroy-square, Mrs. M. EALES, widow of the late T. Eales, Esq., of Belmont Staindrop, Durham, aged 74.

YORKSHIRE LAND-DRAINING ASSOCIATION.

Capital, 500,000*l.*, in stock of 25*l.*—Deposit, 5 per cent.

PATRONS.—The Right Hon. Lord Beaumont.
The Right Hon. Lord Viscount Morpeth.
Sir William M. Milner, Bart.
Edward Stillingfleet Cayley, Esq., M.P.

PROVISIONAL COMMITTEE.

Mr. James Andrew, Kirkham Cottage, Wakefield.
Mr. Caleb Angus, Neswick, Driffield.
J. Barkenridge, Esq., Bretton, Wakefield.
Thomas Bradley, Esq., Richmond.
Christopher Bradley, Esq., Richmond.
Henry Briggs, Esq., Overton, Wakefield.
Mr. George Baker, Roundhay-road, Leeds.
Joseph Dent, Esq., Ribstone-park, Wetherby.
J. Bailey Denton, Esq., 9, Gray's-inn-square, London.
John Grey, Esq., Dilston.
Mr. Edwin Green, Havercroft, Barnsley.
James Hall, Esq., Scorborough, Beverley.
James Hammerton, Esq., Hellifield Peel, Skipton.
J. Mildred Hustler, Esq., Bradford.
R. M. Jaques, Esq., Easby Abbey, Richmond.
James Smith, Esq. (Deanston), 13, Queen-sq., Westminster.
Mr. William Tuke, Bradford.

With power to add to their number.

BANKERS.—The York City and County Banking Company.
STANDING COUNSEL.—H. Bellenden Ker, Esq., Lincoln's-inn.
DRAINING ENGINEER.—James Smith, Esq. (Deanston.)
SOLICITORS.—Messrs. Blanchard, Richardson, and Gutch, York.
SECRETARY.—John H. Charnock, Esq, Wakefield.

This Association is formed for the purpose of affording to the Agricultural Interest, by means of its collective capital, the funds necessary for the THOROUGH DRAINING OF LAND; and of executing and superintending the execution of the works required for this purpose on the most economical and effective principles—repayment of the money advanced to be made, with interest, by such equitable half-yearly instalments as in the several cases may be determined.

Among the various objects to which of late years collective capital has been more or less successfully applied, it is not a little surprising that the one which, of all others, offers the most certain and profitable return, with the soundest security, should have hitherto been almost disregarded. The time, however, has arrived, when an urgent desire for Agricultural improvement on the one hand, and a dearth of safe and profitable investment for superabundant capital on the other, renders such an Association highly desirable to both the landed and monied interest, whilst to the community generally an almost incalculable advantage will be secured by a proportionate increase of labour and food.

At a meeting of the council of the Yorkshire Agricultural Society, held in York, on the 20th of December, 1843, a resolution was passed, approving generally of the objects of this Association, and at the monthly meeting of the Wakefield Farmers' Club held on the 5th January, 1844, a resolution approving of the principle and objects of the Association, was unanimously adopted.

At the meeting of the Royal Agricultural Society of England, at Liverpool, in July, 1841, Lord Stanley remarked—that "there was no bank in the whole country—no commercial speculation—no investment so safe, so sure and profitable, as that in which even borowed capital may be engaged, by investing it under the ground of your own soil." And in reference to this Association, his Lordship, in a letter to the Committee says:—"I am fully satisfied of the benefits which such an Association is capable of conferring on the country, if confined to its legitimate object—the lending of capital on the security of an investment in draining; and I think it very probable that many landed proprietors would avail themselves of the facilities afforded by an institution lending money on land, repayable by instalments—a condition on which few private parties are willing to lend.

Bearing in mind the important objects of the Association, and the perfect security with which its operations can be conducted, at a comparatively trifling expense (no large expenditure for previous outfit being required), it may be reasonably expected that the return for the capital embarked will be such as to insure the support of prudent and permanent investors, thereby divesting it of that speculative character which has stigmatised so many modern projects, and which it is the especial desire of the Committee to avoid.

Application for prospectuses, and further particulars to be addressed to the Solicitors, Messrs. BLANCHARD, RICHARDSON, and GUTCH, York; or to J. H. CHARNOCK, ESQ., the Secretary, Wakefield.

THE HAIR.—Of the numerous compounds constantly announced for promoting the growth or reproduction of the Hair, few survive, even in name, beyond a very limited period; whilst ROWLAND'S MACASSAR OIL, with a reputation unparalleled, is still on the increase in public estimation. The singular virtues of this successful invention for *restoring, preserving*, and *beautifying* the *Human Hair*, are too well known and appreciated to need comment. The very facts of the high and distinguished patronage it enjoys, its general use in all countries, together with numerous testimonials constantly received in its favour, are authorities which stamp its superior excellence and title over all attempts of a similar nature. Being universally preferred, its consequent great demand excites the cupidity of unprincipled Shopkeepers, who vend the most spurious trash as the "GENUINE" *Macassar Oil*; whereas the genuine article is wholly the invention and property of A. ROWLAND and SON, and the amalgamation of its *costly exotic* materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "*Macassar Oil.*" The genuine article has the words ROWLAND'S MACASSAR OIL on the wrapper.—All others are FRAUDULENT COUNTERFEITS!!!

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

FOREIGN WINES greatly REDUCED in PRICE, for Cash, in quantities of one dozen and upwards, and which, if not approved of, will be exchanged, or the money returned.

	PER DOZEN.
Sherry (Pale or Brown), at..	21s. 25s. 30s. 35s. and 40s.
Port from the Wood	23s. 26s. 30s. and 34s.
Ditto, Crusted	26s. 30s. 36s. and 40s.
Madeira	27s. 40s. and 48s.
Claret	30s. 40s. 50s. and 60s.
Champagne (in pints, 2s. extra)	40s. 54s. and 70s.

Bucellas, 27s.; Vidonia, 24s.; Lisbon (dry or sweet), 24s.; Marsala, 21s.; Cape, 15s. per dozen. Hampers, 9d.; bottles, 1s. 6d. per dozen, if not returned. Payment to be made on or before delivery in town; and orders from the country must be accompanied by a remittance. Samples can be tasted at the Office.—CORNWALL and Co., 14, Walbrook, City.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND, SEEDSMEN.

THOMAS GIBBS and Co., corner of HALF-MOON-STREET, Piccadilly, London, having had the honour of being officially appointed the SEEDSMEN to the "*Royal Agricultural Society of England*," beg to assure the Members of the Society, and their Agricultural Friends in general, that this renewed mark of confidence will stimulate them to continued and fresh endeavours to merit so high a distinction. It has been the endeavour of the firm ever since their appointment as Seedsmen to the late Honourable Board of Agriculture, in 1799, and to the Honourable Board of Agriculture of Sweden, to devote their attention to supplying no seeds but such as they consider to be of the best quality; and they feel assured, that by strictly adhering to this principle, they shall be enabled to secure a continuance of that support which they have now received for 50 years.

THOMAS GIBBS and Co. beg to call the attention of Agriculturists to their general Stock of Seeds, to the selection and saving of which they have devoted the greatest care and attention. Among others, they beg to call particular attention to the following, viz.:—

GRASS SEEDS,

For forming permanent Meadows and Pastures.

Mixtures of Selected Natural Grass Seed for the purposes above mentioned, proportioned and adapted to suit the nature of different soils. T. G. and Co., having formerly had their attention particularly called to this peculiar department of the business, in a scientific point of view, by the Honourable Board of Agriculture in 1799, have ever since that time continued to make the Grasses a matter of particular study and attention. From the long experience in laying down land in all parts of the country, they confidently rely upon their being able to give entire satisfaction in their selections.

Mixtures of the above especially adapted for field-lawns and parks.

WHITE BELGIAN CARROT.

Large white Belgian (or Flemish) Carrot (of which extraordinarily heavy crops are obtained).
Large Field Altringham (Red) Carrot an excellent field Carrot.

MANGOLD WURZEL.

Long Red Mangold Wurzel (producing very large crop).
Yellow Globe ditto, ditto (highly approved to shallow soils).
Red Globe ditto, ditto (adapted to light shallow soils).
Long Yellow ditto ditto.

TURNIPS.

Purple Top Swedish Turnip (combining large produce with beauty of form and smallness of top).
Green Top ditto ditto (hardy and useful variety).
Gibbs's Green Top Yellow Hybrid (strongly recommended—will bear sowing later than Swedes, and next to the Swede in hardiness).
Gibbs's Red ditto ditto (same as the above, with red top).
Green Globe Turnip.
Early Stubble Turnip, and other varieties of known good qualities.

All kinds of Agricultural and other seeds; different varieties of Grass seeds; Italian Rye Grass, Improved Perennial Rye Grass, Clovers, &c. &c.

Please address

THOMAS GIBBS and Co., the Seedsmen to the "Royal Agricultural Society of England," and to the Hon. Boards of Agriculture of England and Sweden, corner of Half-Moon-street, Piccadilly, London.

SKIRVING'S IMPROVED SWEDE TURNIP.

W. SKIRVING, SEEDSMAN, Queen-square, Liverpool, begs to acquaint his Agricultural Friends and the Public, that the price for the present season of the Genuine Seed of his improved Swede Turnip is 1*s.* 6*d.* per lb.; the sort warranted the same as that for which he received the Premium of the Royal Agricultural Society of England. All other sorts of Turnip-seeds of the common kinds at the usual prices; also the most approved varieties of Mangold Wurzel, large White Belgian and Altringham Carrot.

For permanent Pasture, W. SKIRVING begs to offer his Selection of the most useful Perennial Grass-seeds. The sorts selected from personal observation of the growth and habits of the different Grasses grown in his experimental Grounds at Walton. On this system he has supplied within a few years, Seeds for many thousand acres, which have given every satisfaction. Orders stating quantity and quality of land to be laid down, will be correctly executed, with a suitable mixture.

For alternate Cropping, W. S. can recommend Seed of pure Italian Rye-grass, grown and carefully saved on his own farm.

PIANO-FORTES.—LUFF and Co.'s Boudoir or Piccolo only £25, including use of case, is the best and cheapest Piano-Forte for the country Cottage, being only 3 feet 6 inches high, with curtain front and back; it is powerful in tone, is warranted to keep well in tune, and prepared for extreme climates. L. and Co.'s Patent Cottage Cabinet and Semi-Grand is equally cheap.—LUFF and Co., Manufacturers, 103, Great Russell-street, Bloomsbury.

TWENTY YEARS' LOSS of HAIR, and WONDERFUL RESTORATION. Church-street, Whitby, Oct. 19, 1841.——Gentlemen,—Of the last supply of OLDRIDGE'S BALM OF COLUMBIA every bottle was sold immediately on receipt, and I have many more bespoke, only waiting for a further supply, which I hope you will send without the least delay. Orders have poured in more than ever since the powerful effects of the Balm have been so decisively demonstrated in the cases of several credible and respectable inhabitants of the town. One instance, among others which have attracted particular attention, is the case of a gentleman who had had little or no hair for 20 years; he had tried numerous preparations in vain, and ultimately had his head shaved, and wore a wig. At my recommendation he tried the Balm; and after using it according to the directions for a short time, the young hair appeared, and he has now as fine a head of hair as any person in Whitby. Yours, &c., JOHN KILVINTON.—To Messrs. Kennaby, Brothers, 10, Westmoreland-buildings, Aldersgate-street, London.

OLDRIDGE'S BALM prevents the hair turning gray, produces a beautiful curl, frees it from scurf, and stops it from falling off; a few Bottles generally restore it again. Price 3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle. *No other prices are genuine.* Ask for OLDRIDGE'S, BALM of COLUMBIA, 1, Wellington-street, Strand.

NEW GARDEN NET, 1½*d.* per yard, second-hand do., ¾*d.* per yard, quite perfect; Garden Net, ½ inch mesh, warranted to protect the blossom, 2½*d.* per yard; a fibrous Hemp Net, New Hemp Net, 36 meshes to an inch, 7½*d.* per yard; Worsted and Woollen Nets, Net to fence out Hares and Rabbits, 2*d.* per yard, tarred; Tarpauling Frame Fit and Greenhouse Covers, 1*s.* per square yard; Long Hare and Rabbit Nets on Cords, 50, 80, and 100 yards long. Upwards of 1000 London Policemen's Capes, 2*s.* and 2*s.* 6*d.* each, for Labourers, Gardeners, and Farm-servants. Flags, Banners, &c.

TO FARMERS.—Sheep Net nearly 4 feet high, 4½*d.* per yard, of strong cord; Rick Cloths dressed with a pliable composition of Tar and boiled Oil, which never mildew or are touched by vermin, as follows:—for 30 tons of Hay, 30 feet by 30 feet, 5*l.*; 40 tons, 36 feet by 30 feet, 6*l.* 10*s.*; 50 tons, 36 feet by 36 feet, 7*l.* 10*s.* complete with side-lines. Early orders are respectfully solicited for these Rick-cloths, to prevent disappointment. Dressed Wagon and Hay Cart Cloths. Expanding Tents (the only maker) for Lawns, &c., 36 feet round, 6 feet high in the lowest part, 5*l.*; 42 feet round, 6*l.* 10*s.*; 24 feet round, 4*l.*, put up or down in a few minutes, and require no side-lines. Fishing-Nets of all kinds. Nets to cover in Pheasants, Poultry, &c., 2*d.* per yard. Nets made to order. ROBERT RICHARDSON, Net, Tent, and Rick Cloth Maker, 21, Tonbride-place, New-road, corner of Judd-street, London.

BULB CUCUMBER-GLASSES, for Watering by Evaporation during the growth of the Fruit, 2*s.* 6*d.* to 3*s.* 6*d.* each; GRAPE-GLASSES, with holes, 1*s.* 9*d.* to 2*s.* 6*d.* each; BEE-GLASSES, 1*s.* to 2*s.* 6*d.* each. Cylindrical CUCUMBER-TUBES, from 6*d.* to 4*s.* each; PROPAGATING-GLASSES, Green, 1*s.* per lb.; white, 1*s.* 2*d.* per lb.; or 2*s.* 6*d.* to 24*s.* per dozen; FISH-BOWLS, from 1*s.* 6*d.* each; ditto, with hole in the bottom for Fountains, 2*s.* 6*d.* per lb., at APSLEY PELLATT'S Falcon Glass Works, Holland-street, Blackfriars. Orders from the country, accompanied with a Post-office order, will meet with prompt attention.

WANTED a FOREMAN.—Messrs. VEITCH & SON are in immediate want of a respectable person to act as FOREMAN in the PLANT DEPARTMENT of their Nursery. It is not requisite he should understand Propagation, as a Propagator is kept in the same department.—Exeter, April 4, 1844.

WANTED by Messrs. WILLMOTT and CHAUNDY, of Lewisham, a respectable middle-aged Man as Home Ground Foreman—one who understands the Management of Plants generally, their Propagation, Names, and Value. A satisfactory character for honesty, sobriety, industry, and civility, will be required. It is a rule in their Establishment to discharge any man the second time he is known to be intoxicated. None need therefore apply who are given to drinking, as it would only lead to disappointment.

WANT PLACES.—All Letters to be post-paid.

AS FOREMAN, or FOREMAN and PROPAGATOR in the PLANT DEPARTMENT.—A Young Man, who perfectly understands his business in all its branches. Reference can be given as to character and ability. Direct to A. B., Messrs. HENDERSON'S, Pineapple-place, Edgware-rd., London.

AS GARDENER.—A single Man, 30 years of age, who is perfectly acquainted with his business in every department, and from his service in some of the best forcing establishments in the country, he is confident he will give great satisfaction. The most unexceptionable testimonials as to character and abilities will be given.—Direct to Y. Z., Mr. Jackson's Nursery, Kensington.

AS GARDENER.—A married Man, aged 46, whose incumbrance is but small, is desirous of obtaining a Situation in a regular family; wages not being so much an object as a comfortable Situation. He is well versed in every branch of his business. Can have an eight years' character from the family he last lived with.—Direct to I. G., Post-office, Lower Tooting, Surrey.

AS GARDENER.—A young Man, aged 28, who has a thorough practical knowledge of his business in all its branches, and whose character will bear the strictest scrutiny.—Direct to WILLIAM THOMSON, Gardener to George Byng, Esq., M.P., Wrotham Park, Barnet, whom the advertiser has served as Foreman for six years.

AS GARDENER.—In a Nobleman or Gentleman's family, a young Man, who understands his business in all its branches; Vines, Pines, &c.; has lived in families of rank, both in England and Scotland, and can be highly recommended by his late employers.—Direct to G. C., Mr. Gaines's Nursery, Battersea.

AS GARDENER, where one or more men are kept.—A young Man, aged 34, of respectable habits, who has had great practice in all the superior branches of Gardening, and is capable of taking the management of any collection of Plants; has no objection to the charge of meadow-land, or to reside in any part of the United Kingdom. He can have an unexceptionable character from the gentleman he has lived with.—Direct to A. G., at Barton's Post-office, Holloway.

AS GARDENER.—A Married Man, aged 38, without encumbrance, who thoroughly understands his business, with land and stock, if required; can have 5 years' character, and be strongly recommended by the gentleman he has just left. Direct, J. D., No. 4, Westbourne-street, Pimlico.

AS GARDENER.—A single Man from the country, aged 27, who has a good knowledge of early forcing, and of Gardening in general; and no objection to make himself otherwise useful. Can be well recommended by the gentleman whom he has lived with for five years.—Direct to B. T., Mr. GIBBS, corner of Half Moon-street, Piccadilly.

AS GARDENER.—A single Man, aged 27, who perfectly understands Gardening, and can have a good character from the gentleman he has lived with.—Direct to WM. MOORE, Caen Wood, Hampstead.

AS GARDENER.—A steady, respectable, married Man, aged 35, who perfectly understands the Kitchen-garden, Pleasure-grounds, Greenhouse, Vinery, and all kinds of Forcing; has also a general knowledge of Cattle and Meadow-land. No objection to milk a cow, if required. He can have a good character from his last place.—Direct to Y. Z., at Mr. CUTTRIDGE'S, Baker, Shepherd's Bush, Middlesex.

AS GARDENER, or LAND-BAILIFF.—A gentleman now parting with his Gardener is desirous to obtain a situation for him in the above capacities. He has been in his present place for eight years; is well acquainted with all kinds of stock; with the care of a garden, more particularly as regards Fruit and Vegetables, and bears an unexceptionable character for honesty and steadiness.—Direct to A. B., at Mr. Selmes, Butcher, High-street, Croydon.

AS GARDENER.—A single Man, aged 30, who thoroughly understands the management of the Hothouse, Greenhouse, Forcing, and Kitchen Gardening in general; he can have three years' character from the situation he has just left.—Direct to J. Z. C., 8, Coles-place, Dover-road, Borough.

TO GARDENERS.

AS UNDER-GARDENER.—A Premium of 8*l.* will be given by the advertiser to obtain a situation as Under-Gardener, where all the different branches of Horticulture may be acquired. The advertiser has served his time in a Nursery, and will expect to engage for a certain period, which would be afterwards settled by correspondence. No situation will be accepted unless it answers the above statement.—Direct to T. P., Kensington Nursery, Bath.

AS GROOM and GARDENER.—A Single Man, aged 40 years, who has no objection to the charge of Cows and Pasture Land, if required. He can have 20 years' good character; and the reason he is leaving his present situation, is the breaking up of the establishment. Wages 16*s.* weekly.—Direct to A. B., at Mr. Putman's, Wood Street, Walthamstow, Essex.

TO NOBLEMEN AND GENTLEMEN FARMERS.

THE Friends of a Young Man, aged 24, a thorough Practical Farmer, are desirous of procuring him Employment. Address, W. D., 220, Regent-street, London.

TO NOBLEMEN, GENTLEMEN, LANDED PROPRIETORS, AND GENERAL ESTATE AGENTS.

THE Advertiser is desirous of obtaining a SITUATION as the RESIDENT MANAGER of an Estate. Security can be obtained to any amount, and references can be given which are unquestionable. Direct T. O., 115, Post-office, Stamford-bridge, Worcestershire.

ROYAL BOTANIC SOCIETY, Regent's Park.—EXHIBITIONS of PLANTS, FLOWERS, and MICROSCOPES in the Garden of this Society, for 1844.

Tuesday, April 30.
Tuesday, June 4.
Tuesday, July 2, 1844.

When Prizes exceeding 900*l.* will be competed for.

Fellows and Members, and the bearers of Ivory Tickets, will be admitted upon entering their names in the Gate-book.

Visitors may obtain Tickets at 5*s.* each, except on the days of Exhibition, when they will be 7*s.* 6*d.* each, by orders from Fellows and Members of the Society only.

The Gates to be opened at 2 o'clock. Carriages to enter the Inner Circle of the Park by the road opposite the York Gate, to set down in front of the principal Gate of the Gardens, and to take up at the Gate opposite the road leading to Chester-terrace. Should the weather prove wet, a New Gate connected with the Tents will be opened.

Tickets and further particulars at the Gardens.

By order of the Council. J. D. C. Sowerby, Sec.

HORTICULTURAL SOCIETY at HERTFORD. The first EXHIBITION is fixed for Thursday next, April 25th, in the Shire Hall, Hertford. Doors open at 2 P.M. Admittance, 1*s.*

DAHLIAS.—SPARY'S "Lady Antrobus" and "Aurantia." E. SPARY begs respectfully to inform the Trade, and Florists in general, that he has a fine healthy stock of the above now ready for delivery—with the select new and old varieties.—Hungerford, April 18, 1844.

SPLENDID NEW MIMULUS—"MOODIEANA." L. MOODIE begs to state that he will commence sending out the above beautiful MIMULUS on the 23d inst., at 2*s.* 6*d.* per plant, with the usual allowance if three or more are taken. For description see Mr. Glenny's "Answers to Correspondents" in last week's *Gazette*:—"Mimulus.—*L. M.*—Red and showy, good broad lip, and high colour; size above the average." Agents—Messrs. Flanagan and Co., Mansion House-street. Messrs. Hurst and M'Mullen, Leadenhall-street, where flowers of it may be seen.

Highbury Nursery, Islington, April 18, 1844.

CHEAP PLANTS for turning into the BORDERS.—Fragmore Scarlet and other Pelargoniums, 30 varieties of Fuchsias, Verbenas, Petunias, Celsias, Heliotropes, Lobelias, Salvias, Calceolaria, Mimulus, Lophospermum, Ageratums, Senecio, Musk, &c. &c., all at the low price of 4*s.* per dozen; and also all the new Fuchsias, Verbenas, &c., as they come out, at moderate prices.—P. Porter, Nursery, Sussex-place, Lough-borough-road, Brixton.

SEEDLING GERANIUMS. WILLIAM E. RENDLE having raised a few GERANIUMS, from seeds procured from some of Mr. ——'s superior sorts, and considering that many Amateurs would feel interested, and desirous of cultivating a few choice seedlings, now offers an opportunity to those inclined to speculate, and will forward a dozen Seedling Geraniums, securely packed, and forwarded to the Beam-bridge terminus of the Great Western Railway, on receipt of a Post-office order for One Guinea. Strong Plants in 48-sized pots.

William E. Rendle's Spring Catalogue of Geraniums, Dahlias, Fuchsias, Camellias, New Plants, &c., is just published, and can be had on application.

Union-road Nurseries, Plymouth, April 16, 1844.

SUPERB SEEDLING DAHLIAS TO BE SENT OUT FIRST WEEK IN MAY.

GAINES'S "Princess Alice,"—Pure white, very full centre, the petals finely cupped; was considered by all who saw it growing the best White Dahlia; gained several prizes; a good show-flower, 4 ft., 10*s.* 6*d.*

Gaines's Twickenham Rival.—Fine yellow, occasionally tipped with red: a superb round thick petal, fine circular form; the best yellow yet offered to the public; gained several prizes; a good show-flower, 4 ft., 10*s.* 6*d.*

Gaines's Countess of Zetland.—Blush, tipped with lilac; fine round thick petals; a good show-flower, 4 ft., 10*s.* 6*d.*

Gaines's Enterprize.—Crimson purple, a superb show-flower, 4 ft., 10*s.* 9*d.*

A List of Dahlias, Pelargoniums, Pansies, Calceolarias, Fuchsias, Verbenas, Auriculas, Cinerarias, Chrysanthemums, &c., containing many New Seedlings of first-rate qualities, may be had on application at the Nursery, Surrey-lane, Battersea.

CHOICE PANSIES. J. HENCHMAN begs to inform cultivators of the PANSY that he is now sending out healthy plants of six good seedling varieties, for 21*s.* the set. Also a few choice kinds at 15*s.* and 18*s.* per dozen.—Edmonton, April 1844.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

YOUELL and CO.,

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN; HIS MAJESTY THE KING OF THE BELGIANS; NURSERYMEN AND FLORISTS BY SPECIAL APPOINTMENT TO HER MAJESTY THE QUEEN DOWAGER.

NOW READY FOR SENDING OUT.
THE NEWEST AND VERY BEST FUCHSIAS, VERBENAS, PETUNIAS, ANAGALLIS, &c.,
FOR 1844.

YOUELL and Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Catalogue of the above, which appeared in this Paper of the 6th inst., and will be found to contain such varieties only as are worthy of cultivation.

Youell & Co. being the parties who first sent out per post, with safety, these tribes of plants, are desirous of calling attention to their advantageous method of executing orders, namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, upon the following terms:—

12 Extra Fine varieties, 12*s.*, the Selection left to Youell & Co.
12 ditto ditto 21*s.*, the Selection left to the Purchaser.
50 Fine varieties . . 40*s.*, the Selection left to Youell & Co.
50 Extra Fine ditto . 60*s.*, the Selection left to the Purchaser.

VERBENAS.

12 Extra fine Varieties, 6*s.*, the selection left to Youell & Co.
12 Ditto ,, 10*s.*, the selection left to the purchaser.

PANSIES. [Sent postage free.]

12 Fine Show Varieties, by name . . 10*s.* per dozen
12 Extra Fine ditto, do. . . 18*s.* ,,

CHRYSANTHEMUMS. [Sent postage free.]

Fifty of the newest best varieties by name, 12*s.* per dozen; for list and colours of which, see Advertisement of the 6th inst.

FLOWER-SEEDS.—30 Packets of the choicest and newest kinds sent per post free for 6*s.*

TWO NEW SEEDLING PICOTEES.—"Lady Alice Peel," 10*s.* 6*d.*, and "Mrs. Benyon," 10*s.* 6*d.* per pair.—These two splendid Picotees were raised by the Rev. J. Burroughes, of Lingwood Lodge, Norfolk, and kindly presented by that gentleman to Messrs. Youell & Co., for particulars of which see their Advertisement in this Paper of the 6th inst.

FINEST CARNATIONS and PICOTEES.

YOUELL and Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly-esteemed Flowers, which appeared on the Advertising pages, 706 and 707, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

Prices as follows:

	£.	s.	d.
12 pair of good Show Sorts	1	4	0
12 ditto fine ditto	1	10	0
25 ditto ditto	3	0	0
12 ditto extra fine and very superior ditto .	2	10	0
25 ditto ditto . . . ditto	5	0	0

The selection being left to Youell & Co.

FASTOLFF RASPBERRY.

For Particulars of this highly-valuable and much-esteemed Raspberry, Patronised by her Most Gracious Majesty the Queen, and most of the Nobility, see their Adv. of the 6th inst. Fine Canes are ready for delivery, and can be sent with safety to any part of the United Kingdom (on the receipt of a Post-office order), upon the following terms:—

Packages containing	100	Canes	.	£2	5*s* 0*d*
Do.	do.	50	do.	1	5 0
Do.	do.	25	do.	0	14 0

Package included.

☞ CAUTION.—Youell and Co. deem it requisite to inform their Friends and the Public in general of the fact, that other varieties of Raspberries are being offered for sale under the title of "Fastolff," and such having no pretensions whatever to the genuine variety, they beg to state they cannot be held responsible unless it has been supplied from their Nursery; neither have they appointed any Agents for the sale of it.

ARAUCARIA IMBRICATA IN POTS.

Recently planted most extensively at Her Majesty's Gardens at Windsor, and also at the Royal Gardens, Claremont, furnished by Youell and Co.

YOUELL and Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 10 inches high, 10*l.* per 100, or 30*s.* per dozen.

Fine Plants of CEDRUS DEODARA, 2ft. to 2ft. 8 ins., 10*s.* 6*d.* each.

Great Yarmouth Nursery, April 18, 1844.

N.B. All Orders above £2 will be delivered carriage free either to London or Hull, or goods added to compensate for the same.

NEW DOUBLE WHITE BRUGSMANSIA, B. KNIGHTII.

THOMAS CRIPPS, Nurseryman, Tunbridge Wells, respectfully intimates to his Friends he has now ready for sending out, Plants of the above Double and delightfully fragrant dwarf flowering Brugsmansia, at 21*s.* each, in 48 sized pots, or small, in thumb pots, 15*s.*, with the usual discount to the Trade.

BUSHELL'S Light Seedling DAHLIA, "Emma."—Plants in May, 10*s.* 6*d.* Colour white, tipped with deep cherry; the petals, form, and centre good; the largest, most constant, and free in flowering, of any Dahlia yet propagated, and has obtained several prizes. "Pet Rival," plants in May, 5*s.* Colour, purple maroon; fine cupped petal, and free bloomer; exhibited in several winning stands last season. "Kennington Rose," plants in May, 5*s.*; most constant rose grown. To be had of Messrs. Ansell, Camden-town; S. Girling, Stowmarket; F. and A. Smith, Hackney; and J. Bushell, 12, Hall-place, Kennington-lane.

FUCHSIA DICKENS.

J. INGRAM, NURSERYMAN, SOUTHAMPTON, begs to offer the above-named unique Fuchsia at 7*s.* 6*d.* each, with an allowance to the Trade if three or more are taken. Its character is that of Formosa elegans, but far excels it in point of size, colour, and general habit. Should it not turn out as described, no charge shall be made.

J. Ingram, 9, Above-Bar Street.

MESSRS. J. and H. BROWN, respectfully offer to the Nobility and Gentry the following Plants for Bedding Out, &c.

☞ The above Plants carefully packed and forwarded to any part of the United Kingdom. A post-office Order or reference for payment in Town. Persons erecting Greenhouses or Conservatories can be well supplied with the choicest and best of Plants for furnishing, including the many handsome Climbers recently introduced.

N. B.—Plants securely packed for exportation.—Albion Nursery, Stoke Newington, London.

WARNER and WARNER, Seedsmen, 28, Cornhill, London, beg to inform their Friends that they can supply all the new varieties of Fuchsia, Petunia, Verbena, Calceolaria, Geranium, Dahlia, &c. &c. now out, either in Collections or by the single plant.

Plants of the New Black Nemophylla, 9*d.* each. Potter's Liquid Guano, in quart bottles, 1*s.* 9*d.* each. Super-phosphate of Lime, in 7 lb. packets, at 1*s.* each. Whitney's Chemical Transparent Waterproof Composition, with directions for use; in pints, 2*s.* 6*d.* each, quarts, 4*s.* 6*d.* each.

For their Advertisements of new and choice Flower and Vegetable Seeds, see their lists in Harrison's "Cabinet" for April, and the preceding Numbers of the *Gardeners' Chronicle*.

MESSRS. MARNOCK and MANLEY beg to inform their Friends and the Public, that their DESCRIPTIVE CATALOGUE OF FUCHSIAS, VERBENAS, CINERARIAS, DAHLIAS, &c., with a Treatise on the best and most successful Modes of Cultivation, is now ready, and may be had on application.

N.B.—Their beautiful Fuchsia, Marnock's Princess Sophia, is now ready to be sent out; the stock is not large, therefore early orders will prevent disappointment.

Messrs. Hurst and M'Mullen are Agents for their Fuchsias and Cinerarias. Nursery, Hackney, April 19, 1844.

SPLENDID LARGE, DEEP-BLUE ANAGALLIS and SUPERB CINERARIAS.—Plants of that large, splendid deep-blue, full and complete round-petalled ANAGALLIS BREWERII, being of a strong and vigorous habit, are well adapted for bedding out; 12*s.* per dozen.

SUPERB CINERARIA SEED, saved from the most esteemed named kinds, and other new and beautiful Seedlings, comprising every shade of dark and light-blue, at 2*s.* 6*d.* per packet. Strong flowering plants of the above, 12*s.* per dozen. Applications, including Post-office orders, will be immediately executed.—Direct to Michael Brewer, Sen., Cambridge Nursery.

MAY'S "QUEEN OF MAY" CINERARIA.—The above new and beautiful Cineraria is now ready to be sent out by post, or otherwise, at 5*s.* 6*d.* each, including case, prepaid. It is confidently recommended as being one of the most splendid novelties that has been offered in Cinerarias; the colour being a beautiful light sky-blue; the flowers large and of good form; the plants compact, shrubby, and dwarf in growth.

W. M. begs to state that his descriptive List of new, superb Calceolarias may be had on application to William May, Hope Nursery, Bedale, Yorkshire.

W. M. also begs to intimate that he cannot supply any more Eucharidium grandiflorum.

MANGEL WURZEL.—Mr. Robert Baker, of Writtle, has for Sale a quantity of Mangel Wurzel Seed, warranted, from transplanted roots, and which he has carefully selected and improved for upwards of 30 years, until he has obtained perfection equal to that of any other Stock in the kingdom. Globe Orange, 1*s.* 6*d.* per lb.; Globe Red, 1*s.* 3*d.* per lb., Long Red, 1*s.* 3*d.* per lb. Upon receiving a Post Office Order the Seed will be forwarded to any part of the kingdom.

SEEDLING VERBENAS.

E. H. FULLER respectfully informs the Public that he intends sending out in April the following new and distinct Varieties of VERBENAS, which have been universally admired, and submitted to Dr. LINDLEY.—Vide *Gardeners' Chronicle*, Oct. 14, 1843, p. 721.

E. H. FULLER, No. 2 (INCOMPARABLE), "brilliant rich purple, with a white eye, the best of its colour we have seen."—Plants in April, 5s. each.

No. 3, LUCASII, "delicate pink, clear and good."—2s. 6d. each.

No. 4, LOUIS-PHILIPPE, "rosy-purple, clear and steady in colour, a good Variety."—Plants 3s. 6d. each.

"These flowers are characterised by having the colours very clean, not dirty nor uncertain, as it frequently happens. The flowers are rather small, but this may arise from want of better cultivation."

The usual trade allowance if three or more plants are ordered. All orders will be sent post-free, or by coach, paid to London. A Catalogue of Fuchsias, Geraniums, &c. &c. will be forwarded by post on application.—Worthing, April 19, 1844.

PELARGONIUMS, AURICULAS, CARNATIONS, AND LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by APPOINTMENT FLORIST TO HER MAJESTY, begs to inform the Nobility, Gentry, and Amateurs, that in consequence of the success he has had in the cultivation of the above Flowers at his new Garden (where he requests an inspection of the quality of his plants), he can offer them at very moderate prices. His Catalogue of PELARGONIUMS, AURICULAS, and NEW PLANTS, is now ready, and will be forwarded by post on application. The Trade supplied.

KEYNES' STANDARD OF PERFECTION; DODD'S ORANGE SUPERB; DOWDING'S EMMA NOKE.—Nurserymen who can supply fine plants of these first-rate varieties, the first week in May, 1844.

Low and Co., Clapton
HURST and M'MULLEN, London
NUTTING, Cheapside, London
GIRLING, Stowmarket
RENDLE, Plymouth
FOSTER, Stroud
MITCHELL, Maresfield, Sussex
LODGE, Manchester
APPLEBY, York
HARRISON, York
EDWARD, York
WATKINSON, Manchester

MAULE and Co., Bristol
PINCE and Co., Exeter
VEITCH and Co., Exeter
HANDASYDE, Edinburgh
MOUNTJOY, Ealing
WIDNALL, Cambridge
BROWN and ATTWELL, Uxbridge
HODGES, Cheltenham

W. IVERY, FLORIST, Peckham, near London, begs most respectfully to offer after the 23d inst. the following beautiful Seedling PETUNIAS, FUCHSIA, and VERBENA.

PETUNIAS.

FAVOURITE.—Large, light, with a fine blue pencilled eye, 3s. 6d.

MAGNA CHARTA.—Large, light, shaded with rose, and a very fine pencilled eye, 5s.

OVID.—Very large, purple, and good shape, 3s. 6d.

PRINCE ALBERT.—A very distinct, bright rose, 3s. 6d.

RELIANCE.—Large, light, with a beautiful pencilled eye, and good shape, 5s.

THE PET.—Small, light, with a beautiful rose edge, and striped eye, 5s.

FUCHSIA.

PRIDE OF PECKHAM.—Tube flesh-coloured, sepals tipped with green, corolla scarlet, very distinct, and fine habit, 7s. 6d.

VERBENA.

PURPLE QUEEN.—Extra fine in colour and shape, 5s.

N.B.—A select Catalogue of Geraniums, Fuchsias, Verbenas, Cinerarias, Petunias, Phloxes, &c., may be had on application

CROSS LANES NURSERY, near BEDALE, YORKSHIRE.

WM. JACKSON AND CO., beg to state that they can still supply the following Plants, strong and well-established:—Veronica speciosa, 12s. 6d.; Tropæolum azureum, 12s. 6d.; Clematis Sieboldii, 1s. 6d.; Clematis azurea grandiflora, 2s. each; Fuchsias, 12 of the most approved and distinct varieties for 12s. 6d., including Exoniensis, Prince Albert, Stanwelliana, Prince of Wales, and their Seedling "Conqueror," a very fine variety, with long tube and sepals, of a fine bright scarlet, corolla salmon colour; an abundant bloomer.

A reference or remittance from unknown correspondents is respectfully solicited.

SEEDLING FUCHSIAS AND VERBENAS.

GEORGE SMITH begs to inform his Patrons and Friends that his SEEDLING FUCHSIA CYLINDRICA SUPERBA (a singularly interesting flower), he regrets to say, will not be sent out until May 20th, 5s. each, post-free; but respectfully solicits early commands for the following Splendid FUCHSIAS and VERBENAS, which are now ready for delivery: Fuchsia London Rival, a noble and warranted first-rate show-flower, 7s. 6d. each; Globosa grandiflora, the finest Globe ever offered, 5s. each. Verbena excelsa, extra large, of exquisite form, new in colour; no collection can be complete without it, 5s. each; Delicata, large and extra fine show-flower, 3s. 6d.; Array, a fine free neat variety, 3s. 6d.; Striata, a novel striped kind, 2s. 6d. For further description, see this Paper of March 23d. The following Nurserymen and Florists can supply plants of them: Messrs. WARNER, 28, Cornhill; Messrs. SMITH, Hackney; Messrs. HENDERSON, Pineapple-place; HUNSARD, Edgware-road; D. SYRIA, Bloomfield Nursery, Edgware-road; W. MILLER, Providence Nursery, Ramsgate, Messrs. YOUELL, Great Yarmouth Nursery; STEWART, Salthill Nursery; CRIPPS, Tunbridge Wells; E. TILLEY, Bath; Messrs. WOOD, Maresfield; J. HALLEY, Blackheath; E. H. FULLER, Worthing; Messrs. WHITE, Pool Nursery, Dorsetshire; Messrs. SLATER, Exeter; J. FORSYTH, Anlaby, near Hull; R. NEWBERRY, Upway Nursery, near Dorchester.—*** Discount to the Trade.

Tollington Nursery, Hornsey-road, Islington, near London.

IMPORTANT TO GARDENERS and Others.

J. G. WAITE, Seedsman, 1 & 4, Eyre-street-hill, Hatton Garden, London, respectfully offers his Incomparable Hardy Green COLEWORT, as by far the best in cultivation, it turns into heart sooner than any other, stands the frost well, and continues in use till the Spring Cabbages come in; its colour is extremely dark, and flavour most delicious. Time of Sowing, April till July. Price 5s. per lb.

J. G. W. has a large supply of Mangold Wurzel, Turnip and Carrot Seeds, Swede from true Stocks, and of genuine quality, at reduced prices. Catalogues may be had on application.

Cash, or reference in London, is required from unknown Correspondents.

NEW MIXED GRASS SEEDS for PERMANENT PASTURE and LAWNS.—The above Seeds, containing the best sorts, with a suitable proportion of the Perennial Clovers and Trefoliums, are sold at 8s. per bushel, allowing four bushels per acre, by Mr. ROGER SMITHE, Eastling, Faversham, Kent.

Gentlemen are requested to describe the soil.

GRASS SEEDS.

HENRY D. CORMACK, SEEDSMAN, &c. begs to inform Agriculturists in general that they can be supplied with every variety of the Natural Grasses, adapted to the soil, properly apportioned and combined, from his Wholesale and Retail Seed Warehouse, 106, Dean's-gate, Manchester.

FLORIST TO HER MAJESTY THE QUEEN.

PETUNIA PUNCTATA.

W. MILLER refers the readers of the *Gardeners' Chronicle* to his full advertisement of this beautiful flower—just remarking that its *Strong, Dwarf habit*, and *Glossy Dark Green* foliage, contrasted with its lovely, large, spotted flowers (far surpassing any Petunia yet out), render it a desirable object for any greenhouse, and especially to all Exhibitors. He will commence sending out the plants on the 22d inst., at 7s. 6d. each, packed in strong tin cases, to insure their safety, to any part of the United Kingdom, post paid.

The following Nurserymen have ordered plants, and will be enabled to supply them true:—

Messrs. Henderson and Co., Pine-apple-place, London
Low and Co., Clapham, London
Wood and Son, Maresfield, Sussex
Marnock and Manley, Hackney
Veitch and Son, Exeter
Hancock and Son, Durham
Mountjoy and Son, Ealing
Sage and Son, Southampton
Jeyes and Co., Northampton
White and Son, Poole
Garraway, Mayes, & Co., Bristol
Fisher, Homes, and Co., near Sheffield
Rogers and Son, Uttoxeter
Whitley and Osborn, Fulham

LONDON AGENTS.

Messrs. Warner and Warner, 28, Cornhill
Hurst and M'Mullen, Leadenhall-street
Flanagan and Sons, Mansion House-street
Noble and Sons, Fleet-street
Mr. Kernan, Seedsman, Great Russell-street
Mr. Corstein, 19A, Davies-street, Berkeley-square

*** This List will not appear again. We shall commence sending out the plants on Monday the 22d instant.

☞ A few strong plants yet remain.

Providence Nursery, Ramsgate, April 18, 1844.

SUPERIOR NEW SWEDISH TURNIPS.

WARNER AND WARNER, SEEDSMEN, 28, Cornhill, London, beg to introduce to their Friends the following New Swedish Turnips, which for their general good qualities stand unrivalled; growing to a large size, being small in the top, of a dark yellow flesh, and may be grown as close to each other as a Stone or Stubble Turnip.

WARNER'S RUSSIAN SWEDE . . 2s. 6d. per lb.
WARNER'S EMPEROR SWEDE . . 2s. 6d. per lb.

Also WARNER'S Purple-top Yellow Hybrid, 2s. 6d. per lb., with all the varieties of Norfolk and Tankards, of the most genuine and selected stocks, from 9d. to 1s. per lb.

SKIRVING'S IMPROVED SWEDE TURNIP.

W. SKIRVING, SEEDSMAN, Queen-square, Liverpool, begs to acquaint his Agricultural Friends and the Public, that the price for the present season of the Genuine Seed of his improved Swede Turnip is 1s. 6d. per lb.; the sort warranted the same as that for which he received the Premium of the Royal Agricultural Society of England. All other sorts of Turnip-seeds of the common kinds at the usual prices; also the most approved varieties of Mangold Wurzel, large White Belgian and Altringham Carrot.

For permanent Pasture, W. SKIRVING begs to offer his Selection of the most useful Perennial Grass-seeds. The sorts selected from personal observation of the growth and habits of the different Grasses grown in his experimental Grounds at Walton. On this system he has supplied within a few years, Seeds for many thousand acres, which have given every satisfaction. Orders stating quantity and quality of land to be laid down, will be correctly executed, with a suitable mixture.

For alternate Cropping, W. S. can recommend Seed of pure Italian Rye-grass, grown and carefully saved on his own farm.

WM. JOHN CORMACK, AGRICULTURAL SEEDSMAN by Appointment to His Royal Highness PRINCE ALBERT, New Cross, Surrey, and Bedford Conservatory, Covent Garden, begs to call the attention of the Nobility, Gentry, and Agriculturists in general to his combinations of GRASS SEEDS for Permanent Pasture, the Alternate Husbandry, Parks, Lawns, &c. (as recommended and practised by his partner, the late Mr. GEORGE SINCLAIR, Author of the "Hortus Gramineus Woburnensis.") Upwards of 25,000 acres have been converted to permanent pasture by this establishment with the greatest success. Parties requiring Seeds are respectfully requested to state the nature of the soils. Mangold Wurzel, Carrot, and Turnip-seed of excellent sorts, saved from transplanted bulbs. Garden and Agricultural Seeds of the best quality and most approved kinds.

N.B.—Cormack's British Queen and Prince Albert Peas, at 3s. 6d. per quart.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, Hothouse Builders, &c., Gloucester-place, Chelsea, beg to inform Horticulturists that they have made great improvements in their excellent and simple plan of Shading, whereby the largest or smallest can be instantly covered or uncovered with a sheet of canvas. To be seen in use at most of the London Nurseries, and at the Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND, SEEDSMEN.

THOMAS GIBBS and Co., corner of HALF-MOON-STREET, Piccadilly, London, having had the honour of being officially appointed the SEEDSMEN to the "*Royal Agricultural Society of England*," beg to assure the Members of the Society, and their Agricultural Friends in general, that this renewed mark of confidence will stimulate them to continued and fresh endeavours to merit so high a distinction. It has been the endeavour of the firm ever since their appointment as Seedsmen to the late Honourable Board of Agriculture, in 1799, and to the Honourable Board of Agriculture of Sweden, to devote their attention to supplying no seeds but such as they consider to be of the best quality; and they feel assured, that by strictly adhering to this principle, they shall be enabled to secure a continuance of that support which they have now received for 50 years.

THOMAS GIBBS and Co. beg to call the attention of Agriculturists to their general Stock of Seeds, to the selection and saving of which they have devoted the greatest care and attention. Among others, they beg to call particular attention to the following, viz.:—

GRASS SEEDS,

For forming permanent Meadows and Pastures.

Mixtures of Selected Natural Grass Seed for the purposes above mentioned, proportioned and adapted to suit the nature of different soils. T. G. and Co., having formerly had their attention particularly called to this peculiar department of the business, in a scientific point of view, by the Honourable Board of Agriculture in 1799, have ever since that time continued to make the Grasses a matter of particular study and attention. From the long experience in laying down land in all parts of the country, they confidently rely upon their being able to give entire satisfaction in their selections.

Mixtures of the above especially adapted for field-lawns and parks.

WHITE BELGIAN CARROT.

Large white Belgian (or Flemish) Carrot (of which extraordinarily heavy crops are obtained).

Large Field Altringham (Red) Carrot an excellent field Carrot.

MANGOLD WURZEL.

Long Red Mangold Wurzel (producing very large crop).

Yellow Globe ditto, ditto (highly approved to shallow soils).

Red Globe ditto, ditto (adapted to light shallow soils).

Long Yellow ditto ditto.

TURNIPS.

Purple Top Swedish Turnip (combining large produce with beauty of form and smallness of top).

Green Top ditto ditto (hardy and useful variety).

Gibbs's Green Top Yellow Hybrid (strongly recommended—will bear sowing later than Swedes, and next to the Swede in hardiness).

Gibbs's Red ditto ditto (same as the above, with red top).

Green Globe Turnip.

Early Stubble Turnip, and other varieties of known good qualities.

All kinds of Agricultural and other seeds; different varieties of Grass seeds; Italian Rye Grass, Improved Perennial Rye Grass, Clovers, &c. &c.

Please address

THOMAS GIBBS and Co., the Seedsmen to the "Royal Agricultural Society of England," and to the Hon. Board of Agriculture of England and Sweden, corner of Half-Moon-street, Piccadilly, London.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to public competition, at the Auction Mart, Bartholomew-lane, on THURSDAY, April 25, 1844, at 12 o'clock, a splendid assortment of GERANIUMS, and other Plants, in bloom choice DAHLIAS, the newest varieties of FUCHSIAS, HEARTSEASE, &c. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, America Nursery, Leytonstone.

AN EXTENSIVE SALE OF VALUABLE SHORT-HORNED CATTLE, CHEVIOT SHEEP, FARM HORSES, IMPLEMENTS OF HUSBANDRY, &c.

MR. CHRISP will SELL BY AUCTION, at KILHAM, in the parish of Kirknewton, County of Northumberland, on THURSDAY, the 9th day of May, 1844, all the Valuable STOCK on the above Farm belonging to Mr. HUGH BOAG, consisting of about 18 Short-horned Cows and Heifers, Calved and to Calve; 18 Two-years-old Steers and Heifers, fit for grazing; 27 Yearlings, 15 Milk Calves, and 1 Young Bull; 90 Ewes and Gimmers, with their Lambs; 360 Ewe Hogs, 45 Wedder Hogs, 24 Rams, and 30 Ram Hogs, all of the pure Cheviot breed; and 36 Draught and Young Horses.

Mr. CHRISP can with confidence call the attention of the public to this splendid Stock of Cheviot Sheep. For size, constitution, aptitude to fatten, and symmetry of form, they are equalled by few, and surpassed by none in the Kingdom. This affords an opportunity to any one desiring to lay the foundation of a first-rate Cheviot or Half-bred Stock rarely occurring. The Short-horns are bred from the Stock of Messrs. Hunt, Crofton, Chrisp, Smith, Rennie, &c., and are well worthy the attention of the public. Mr. BOAG has used for the last two seasons Mr. Hunt's celebrated Bull, "Guy Faux," by Gainford, 2044 Coates' Herd-book.

The Farm Horses are nearly all Young, combining strength and Activity with good form, and have been bred with great care and attention by the present owner and his father, the late Mr. JOHN BOAG, of Trewit, for many years. The Implements and Harness, suitable for the improved Northumberland Husbandry, are numerous and good.

As the Sale is extensive, it will commence precisely at Ten o'clock, with the Ewes. Gentlemen from a distance desirous of possessing some of this valuable Stock can have them shipped at Berwick, Leith, Glasgow, Annan, or Newcastle, to all of which ports there is easy and convenient access from Kilham, which is eight miles from Wooler, five from Coldstream, sixteen from Berwick, and twelve from Kelso, through which place coaches from Newcastle and Edinburgh pass daily.

*** The above Stock is offered to the public, without reserve in consequence of Mr. BOAG leaving his Farm.

The usual discount or credit.

6, Hinde-street, Newcastle, April 6, 1844.

MESSRS. LAHEE and SON are instructed by Mr STORY, of Isleworth, to submit by Public Auction in June next (unless previously disposed of by private contract) his extensive and superb Collection of Stove and Greenhouse Plants, consisting chiefly of Specimen and Hybrid ERICAS, AZALEAS, CAMELLIAS, &c. &c., comprising in the whole more than Two Thousand Plants. Further particulars will be announced in a future Advertisement, and, at the same time, if not sooner disposed of, the LEASE of the House, Gardens, and Paddock.—Auction Offices, No. 65, New Bond-street.

TO GROWERS OF ORCHIDACEÆ.

MESSRS. J. C. and S. STEVENS beg to announce they will sell by Auction at their Great Room, 38, King-street, Covent-garden, on WEDNESDAY, April 24, at 12 o'clock, the valuable collection of ORCHIDACEOUS PLANTS, the property of Valentine Morris, Esq., of the Retreat, Battersea; amongst them will be found many fine examples of the rare varieties in the finest health: they number about 200 specimens May be viewed the day prior and morning of Sale, and Catalogues had of the Gardener on the premises, and of Messrs. J. C. and S. STEVENS, 38, King-street, Covent-garden.

THE ANNIVERSARY MEETING, for the Election of PRESIDENT, COUNCIL, and OFFICERS for the year ensuing, and for receiving the Annual Report of the Auditors, will take place at the House of the Society, No. 21, Regent-street, on Wednesday the 1st of May next. The Chair will be taken precisely at One o'clock. Horticultural Society, 21, Regent-st.

UNDER THE PATRONAGE OF HER MAJESTY.
ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—The First Grand FLOWER-SHOW of the Season will be held at the Horns Tavern, Kennington, on TUESDAY next, April 23, 1844. Open from One till Half-past Six. Admittance, 1s. R. H. CUMING, Hon. Sec.

The Gardeners' Chronicle.

SATURDAY, APRIL 20, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

TUESDAY, April 23	South London Floricultural	1 P.M.
WEDNESDAY, May 1	Horticultural Anniversary	1 P.M.
	Society of Arts	8 P.M.
FRIDAY, May 3	Botanical	8 P.M.

IF the great HORTICULTURAL SOCIETIES of Europe have produced much good for Gardening by the assistance and stimulus they have given to cultivation, we suspect that a still greater amount of beneficial action would be found to result from the feebler efforts of local institutions of a similar kind, provided those efforts are as well directed as they might be. The great Societies are few in number, and they chiefly tell upon the great; their operations are necessarily on a large scale; small details are missed in the extensive field over which their attention is directed; to apply their power to trifling objects is like harnessing an elephant to a pony carriage, or introducing the paraphernalia of the Queen's Bench into a parish vestry.

It is by local Associations, with smaller means at their disposal, and a more limited sphere of action, that the minute details of Gardening can best be cared for, and more especially those which relate to the objects of the poor. In a country village the principal person, or at least the resident clergyman, knows, or should know, the wants and character of every individual within its limits. He is able to judge correctly what the aim of a Horticultural Society there should be, to devise the best manner of inducing the poor to interest themselves in it, and to frame judicious and practicable rules for its governance. Moreover, his station enables him to maintain authority, without which no Society, great or small, can effect real good. If powers like these are well administered the establishment of little village Societies would be productive of very extensive benefit; for they would be at once the means of increasing the comforts of the cottager, and raising his mind to something higher than the beer-shop, or at best the keep of a pig and the growth of a few Potatoes.

Happily the effect of village Gardening associations, well conducted, is by no means a matter of speculation, but has been most successfully put to the test of experiment.

This is sufficiently proved by the case of the village of Pytchley, in Northamptonshire, an account of which is now before us*. The population of this village is 600; the inhabitants have no Conservatory, nor any forcing buildings beyond Cucumber frames; there is no garden larger than those of the farmers; and the little vicarage garden. Pytchley is in fact what a gardener, accustomed to the splendid forcing-houses and Conservatories of the great, might possibly regard with pity for its Horticultural helplessness. And yet it has its Shows, and its Prizes; and we will engage to say that they produce as much real enjoyment as the splendid gatherings round London. They have been of great use too in the parish, by increasing the produce of the cottage gardens, and by spreading moral good among the poor.

The poor man may be as happy in his frieze jacket as the noble clad in ermine; his little show of vegetables and fruit excites as much interest in his breast as others take in the St. Leger; his penny paid for admission is as large a contribution from his little funds as the guinea of the fine gentleman of May Fair; he experiences as much gratification in winning a sixpenny prize for a nosegay, as the "great growers" of the metropolis when they get a gold medal for a van-load of rare exotics—and perhaps more. Success encourages him to persevere, defeat may excite him to exertion; if neither influence him, the sneers and jeers of his rustic companions will rouse him to a trial—if he is worth the rousing. That accomplished, the course of improvement will not quickly stop.

To us it seems that the rules of the Pytchley Society are upon the whole the best that we have seen; and we would recommend our country friends to take them for a model. One of these rules is, that every exhibitor shall be a member of the Society, paying his annual subscription; and in order to enable the cottagers to do so, this subscription is fixed at sixpence. This, we have reason to believe, produces the best effect, and is better than where, as in many town Societies, prizes are given to cottagers, simply as such. Not that such prizes are without their use; but the poor certainly do not feel the same interest in them as in those which give them a *personal* stake in the Institution, and in which part of the prize comes from their own money.

We wish we could find room for the very interesting description given by Mr. Brown of one of the Pytchley meetings. A scrap or two from it will, we trust, induce our readers to procure his work for themselves.

"On Tuesday, after school was over, two or three who managed the Show began to prepare the schoolroom, which is about twenty feet square. They set up the stages, which consist of green painted shelves and benches, long but light; some meant to be fitted above each other round the room, and some to be piled into a little scaffolding in the middle, leaving a wide passage all round for the company. They ornamented the walls with green Asparagus-tops and small boughs mixed with Dahlias and other large flowers; adding an archway of the same outside the door, and a crown with V. R. made of Dahlias inside. The Society's name, made by fixing small flowers in the shape of the letters upon green painted boards, was hung against the wall inside. According to the season this is made of Daisies, Primroses, blue Cornflowers, Damsons, Chesnuts, &c.——

"Some of the Members had been at work by daybreak in their own gardens, gathering their fruits and vegetables, washing their roots, and tying their nosegays. The managers also were very early in the Show-room, and at length the specimens began to be brought to them. The first who brought his basket of specimens was perhaps a cottager. His name was entered in the Show-book, with a list of everything he had brought; his Potatoes, Kidney-beans, Onions, bunch of Pot-herbs and Currants were put upon separate plates. The next perhaps was a child with a large tastefully-made wild nosegay of field and hedge-flowers; gathered the day before and kept fresh in water all night. In this way about 150 specimens were brought by 23 cottagers and children; to each of which was fixed a red ticket with a number on it, which referred to the order in which its owner had been entered in the Show-book. It is surprising how many plates there were of beautiful Potatoes, Peas, Beans, Kidney-beans, Currants, Gooseberries, Plums, Apples, Radishes; how many nosegays both of garden and wild flowers; and how many flower-pots with Fuchsias, Geraniums, Carnations, Calceolarias, Balsams, &c. There were Cauliflowers and Cabbages, Parsnips and Carrots, Rhubarb and Celery, Filberts, Mushrooms, &c., &c. Some cottagers brought a dozen or more specimens all different; some had but a single nosegay or a Balsam from their cottage window.

"At three o'clock the room was opened to visitors, and a person stood at the door to receive the admission money. All members (and their wives also, if married), are admitted free. A half-penny is charged for the admission of children if they are not members, one penny for cottagers, and sixpence for other visitors; but kind friends have often paid a shilling in order to help the funds. Six shillings and fivepence was received at the door that day, but on a fine day four or five times as much is found in the bag at night. When visitors came in there was many an anxious search made, many an eager look cast round to see which numbers had the prizes; and many a busy knot of members, young and old, gathered together to talk over the matter. None, however, touched even their own specimens until the Show was quite done.

"When dusk was drawing near, the room was cleared of visitors, and the members stayed with their baskets and received back their specimens, the tickets showing to whom each article belonged. Many of the prize specimens, however, had been already sold by their owners to different visitors, and were now given up to them. Many also of the members (some even of the cottagers) left all or part of their fruits and vegetables to be sold for the good of the Society; which was accordingly done (at whatever price they would bring) to the crowd round the door. This sale, which is always much counted on by such villagers as have no gardens, produced 6*s*. 7*d*., but it sometimes produces much more. One or two who had gained prizes, gave a portion of their gains to the Church Missionary box.

"Early next morning the stages were taken to pieces, and along with the plates and tickets, put back into the store until next Show; the schoolroom was cleaned, and by the usual hour the scholars were in their places, as if nothing had happened, except that along with the whole village they had enjoyed a holiday the day before at the FLOWER SHOW.

"The money which had been spent for the Show (that is, the prizes really paid, and the little expenses) was 2*l*. 4*s*. But there had been received at the door either for admission or by the sale, 13*s*.; so that the Show only cost the Society 1*l*. 11*s*. Had the weather been fine there would have been more money received, and the expense would thus have been less. The spring Show only took 5*s*. 6*d*. out of the Society's stock."

Surely there will be a blessing on these things. Surely such simple yet effectual means of raising the character and condition of the village poor will meet in all directions with imitators. We can well believe that it was indeed "delightful and cheering to see the beautiful rows of large and fine fruits, vegetables, and roots, shelf above shelf; the numerous flower-pot plants in full blossom piled up on the middle scaffolding or stage; the various handsome nosegays made up of every flower that grows in garden, field, or hedge. And the inhabitants could point to them and feel that all this show of useful food and natural beauty was grown within their own parish and by themselves."

The English villager is easily managed by kindness; but he is brutalised by ill-treatment. Help him to rise and he will aid your efforts with all his energy—which is not small; encourage him and his natural good feelings will sprout forth and flourish; but beware of trying to crush him, for he *can* become his own avenger. Nothing is more likely to gratify him than little well-conducted village meetings, maintained out of his own funds and decorated by his own hands; they are all that can now be offered in exchange for the fairs and holidays that are passing away for ever. To support them is the best kind of charity, for they tend to assist the poor man in acquiring an honest independence, and they offer a just basis on which to raise both character and feeling. Those are the truest friends of their country who, like the Vicar of Pytchley, give their leisure and their influence to the support of such meetings, which we firmly believe to be so many foci from which rays of moral improvement may spread in all directions.

RIPE PEACHES on the 7th of April! The thing seems impossible; and yet it is really so; for on the 16th a late gathering was exhibited to the Members of the Horticultural Society.

This feat has been performed by Mr. Wm. Hutchison, gardener to E. J. Shirley, Esq., M.P., of Eatington Park, near Shipston-on-Stour, in Warwickshire; and, considering how cold the months of February and March have this year been, is certainly a very remarkable one. In a note which accompanied his specimens, Mr. Hutchison gives the following account of his operations:—

"The Peaches *were grown in pots* in the Pine-house. My first trees were put in on Nov. 25th, 1843; and on Good Friday, the 7th of April last, I gathered the first fruit. Those sent were gathered from the 7th to the 10th. They are superior to what I sent last year, and five days earlier. My trees look better than they did last year, having made very fine wood, *which shows that the Peach-tree will stand hard forcing annually*, if judiciously managed. *I have little doubt of being able to ripen Peaches in March.* A valuable lesson may be learned from this example in making borders for Peach-trees. *To make them wide and deep with rich manures is a mere waste of money.* Six feet wide and eighteen inches deep is what I would advise, the border being thoroughly drained and filled up with good loam from a pasture of medium strength, put in as rough as possible. This would grow the Peach well, and if the trees are well managed would secure a good crop. This may be the more readily believed, from what my specimens prove can be done with a tree growing in the compass of a pot, where a small quantity of soil suffices to produce perfect fruit. I never fumigate my trees. The syringe is all that is required to keep them perfectly clean, if you begin with it in time."

We recommend these statements to the consideration of Peach-growers.

FUCHSIAS.

(*Continued from page* 227.)

The stages of growth in Fuchsias may be considered, 1st, as primary; 2d, intermediate; and 3d, mature. The first stage includes the period of the first shift (March to May and June), from 60s to 32s, or 24s, and where plants have previously been badly managed this may be regarded as the starting point for an attainment of accumulative vigour, previous to the final shift. The highest degree of artificial heat is maintained during this period, and decreased as the plants advance to their mature growth. As the plants acquire vigour, and form their low side-shoots, attention is required to the uniformity of their growth, which is essential, according to the habit they are intended to assume.

The perfect growth of Fuchsias and similarly habited plants depends in a great measure upon the accumulation or secretion of sap in their first stages of growth, and its due exposure to the agencies of light, heat, &c. &c. An accumulated growth differs from an attenuated one, in the former being rendered capable, by a uniform appropriation of the agencies which are essential to growth, of forming a due succession of leaf-buds, which are essential to bloom; whilst the latter, by an inefficient application

* The History and Rules of a Village Horticultural Society, at Pytchley, Northamptonshire; with Rules of the Pytchley Land Allotment for Labourers. By the Rev. Abner Brown. Parker: West Strand, London. 12mo.

of those agencies, is incapable of either, beyond a given extent, in consequence of the abortion of its leaf-buds.

To produce an accumulative vigour from the base of young excitable plants, in 32s or 24s, after the plants have been potted a week, insert a central stake and tie the lower part of the stem; then insert a second at some distance from the first, towards the margin of the pot on that side which is best furnished with low branches or leaf-buds, and bend the leading shoot towards the second stake, so as to admit its being tied as low as possible without danger, after which, if any of the low side shoots admit of being placed in a more uniform and horizontal position, secure them at stated distances with hook-pegs. If any branches have reached an irregular length, and are not forming leaf-buds towards the base, pinch off the top bud; but where the side shoots are very young and excitable, carefully give them an inverted or horizontal position, as before stated. A vertical or upright flow of sap being unfavourable to the formation of side growth, an inverted position of the branches will favour an opposite tendency. The leading shoot may remain inverted for three or four weeks, or longer if it still easily admits its erect position; and whilst in this position it may require a second tie or additional hook-peg. During this process, the plant should be so placed as to expose that side of the plant which is most deficient of low branches to the sun. Another method, favourable to the formation of the lower leaf-buds, is as follows:—When shifting plants from thumb-size, or 60s to 24s, instead of planting them in the centre in an upright position, place each in a horizontal direction, with the bottom of the ball or roots close to the side of the larger pot, which, to a small extent, will leave the upper side of the small ball uncovered, care being taken not to fill up the cavity by the base of the stem; after a few days the leading shoot should be kept in its horizontal position by a hook-peg, for three or four weeks, by which time the lower leaf-buds will be formed as branches, when the peg may be removed, and each plant be allowed to regain its partially-erect habit. During this process (for six weeks) the leading shoot of each is placed contrary to the influence of the sun. Having thus attained an accumulative vigour from the base, the plants are restored to their central and upright position in the next and final potting. Such varieties as Conspicua arborea and Toddiana, &c. &c., which are naturally attenuated in habit when artificially excited to growth, should have the top bud removed whilst young, and repeated, if requisite, to maintain an accumulative and dwarf habit. Also, such varieties as are subject to premature bloom from excessive fertility, as F. tricolor, rosea alba, &c. &c., and any other casual specimen manifesting a similar tendency, should have the blooming shoots cut off to the buds which are forming in the bosom of the lower leaves; care being taken that any process, which has for its object a greater accumulation of sap for future vigour, should be performed when the plant is established in growth, either some time previous or after an intended removal to larger pots. A reason for such a precaution is, that the vigour of all plants is in proportion to the non-disturbance of their vital functions up to a given period.

All varieties of Fuchsias whose habit is naturally favourable to the formation of leaf-buds,—of which F. gracilis may be considered the type, and F. formosa elegans, F. Stanwelliana, F. tricolor, &c. &c., as hybrids—are cultivated most perfectly by an annual renewal from cuttings, and such up to a certain period of growth are benefited by a repeated removal of terminal or top buds, so as to induce a prolific growth and bloom. All varieties which appear favourable to the formation of leaf-buds, but manifest a more luxuriant habit, with a sparing disposition to bloom, should also be encouraged to form uniform leaf-buds, but should on no account be subjected to repeated or late shiftings. Vigorous young plants (from 60s to 48s), should be removed to 12 and 8-size, with due attention to attaining an accumulated growth. All those which partake of the F. fulgens habit, by their formation of terminal racemes of bloom, (rather than of laterals), such as Smith's Defiance, Magnifica, Robusta, Rogersiana, &c. &c., should be especially induced to form leaf-buds in their first stage of growth, as the perfection of their bloom entirely depends upon an early formation of branches, and a luxuriant terminal growth in each. Fuchsia splendens, in common with F. corymbiflora, may be said to depend rather upon an accumulated secretion of sap from the previous season's growth, for successive bloom, than upon its simultaneous production.

With regard to the last species, it may be observed, that a repeated interference with the vital functions of plants marked by an excessive exuberance of growth, is very often the principal cause of the absence of bloom; from which it may be inferred, that any process which operates as a stimulus upon their organs, beyond a given period, is unfavourable to its production.

The importance of an early formation of side-shoots (or branches), and of dispensing with all shifts to larger pots, beyond a given period, in all varieties and species of Fuchsia, is exactly in proportion to their limited and exuberant growth; hence the importance of this rule to the growth of F. splendens, fulgens, and corymbiflora. The last-named species may be bloomed with the greatest certainty and profusion, as middle-sized plants, by limiting the effect of the first season's growth to the production of leaf-buds (as side-branches), and by making the last shift (to whatever sized pot) large enough to dispense with any other throughout the following flowering season. This result will be in proportion to the mature and accumulated growth of each previous autumn. The foreshoots are shortened in the spring, and a top-dressing of rich soil added to each plant, other fertilising materials being applied, if requisite. Such is the method which may be followed in order to obtain the greatest amount of bloom from gross-habited species and varieties in an artificial state of culture.—*William Wood, Pine-apple Place.*

ON THE CULTURE OF THE GENUS CITRUS,

As Practised by Mr. DURDEN,

Gardener at Hurst House, Prescot, Lancashire.

In the *Chronicle* some time ago, Mr. Beaton speaks highly of the Oranges he saw at Hurst-House in 1832, and requested an account of the mode of culture there, which I now give. Since that time a new range of houses has been erected, and the Orangery removed. There are but two of the large trees from the old house planted in the new one; the rest in the latter house are all young plants.

It being almost indispensable for the clear understanding of what follows, that a plan of the Orangery should be given, the above figures represent its ground-plan and section. Measured inside, this house is 14½ yards long, 8 broad, and 6 high. In the centre of the house are eight borders, in which the Oranges, &c., are planted; these borders are all marked *a*. The two borders against the back wall are 16 inches broad, and 3 feet deep. The six borders more immediately in the centre of the house are 14 inches broad and 3 feet deep. The paths are marked *c*, the front wall *d*, and the back one *e*. *p*, *p*, *p*, represent ornamental cast-iron pillars, which, besides supporting the roof, serve also to support light wire trellises: there is one of these pillars in each row for each rafter. The house is entirely heated by smoke flues, two furnaces being placed at *f*. The dotted lines along the central path show the direction of the flues beneath, from the back to the front entrance, where they diverge, the one entering a raised flue (*g*) on the right, the other also entering a raised flue on the left. These flues again cross the house at each end, and the smoke escapes by the back wall; it being found inconvenient to place the furnaces in any other situation. Two stoves immediately connected with each end of the Orangery contain the collection of tropical fruit-bearing plants. The communication between these stoves and the Orangery is uninterrupted by any glass, or other division, so that the Orange tribe are subjected to nearly as high a temperature as the tropical plants. The central borders of the Orangery, as may be seen in the section, are raised a little above each other, as they recede from the front of the house. The Oranges, Citrons, &c, are all trained as espaliers; a light wire trellis being stretched from pillar to pillar, parallel with the borders, and about 8 feet high. The spaces (*b*) between the borders being about 3 feet wide, permit a person to walk along between the plants for the purpose of pruning, watering, &c. These spaces are of the same depth as the borders, and were originally filled with tan; but part of this is now removed, and its place is filled with good soil. In this some fine climbing plants have been turned out, amongst which are several plants of Passiflora quadrangularis, which bear an abundant crop of fine fruit. Besides these, there are also two fine plants of the beautiful new Gardenia Sherbourniæ. These and other climbers are trained up the rafters, &c., in such a manner as not to materially intercept the light from the Oranges. The great advantage of having the trees trained on the trellis system is, that every part of the tree is fully exposed to the light; and by planting them in rows one behind the other, a larger surface is obtained for the trees to cover than could be got by adopting any other plan, and, consequently, for the space, a larger quantity of fruit is procured. The trees being hung loosely and irregularly to the wires, assume as natural an appearance as circumstances will permit; and the introduction here and there of large plants in pots, has a tendency to prevent formality. Two plants are placed in each border.

Soil.—Too much attention cannot be paid to the soil; its principal features ought to be lightness, richness, and openness of texture; and unless it possess these qualities it is unfit for the Orange tribe. It must be considered, in preparing the soil for the pits, that when once the plants have established themselves in it, it cannot, if it ultimately turn out faulty, be removed and replaced by better soil, without very materially injuring the trees, and thereby causing the loss of two or three crops of fruit. The soil in this neighbourhood being of a heavy clayey quality, and very unfit to be used alone, Mr. Durden mixed with it half its bulk of peat-earth and sand, which rendered it all that was desirable. This prepared soil was put into the pits in a rough state, and the plants are succeeding admirably. If the soil used is of a too close or clayey nature, the roots will have great difficulty in penetrating it; water will not pass through it, and air will be excluded. On the other hand, if it is of too permeable or light a texture, the frequent drenchings it must receive to prevent the plants drooping, will wash away all the soluble parts; and the plants in either of these extreme cases suffer.

Temperature.—It is doubtless an erroneous opinion that if the atmospheric temperature is 8° or 10° above the freezing point during winter, and is never allowed to rise above 70° or 80° during summer, that the Orange tribe, other circumstances being favourable, may be cultivated successfully. Mr. Durden never allowed the temperature of his house to fall below 50° during the winter season, and during summer he frequently shuts up the house with a moist atmosphere of 80° or 90°. Mr. Durden has followed this practice through the course of a long life, and with great success. If the temperature be kept high during the growing season, it must necessarily be kept comparatively high during the season of rest; the growth of the Orange-tribe never being totally stopped if they are not starved or otherwise mismanaged.

Water.—This must at all times be sparingly administered, especially if the trees are kept in a high moist temperature; for, if the soil is kept continually saturated, the young shoots will be weak, the plants will present a drawn and debilitated appearance, and the fruit, if they do not drop off, will be small and tasteless. Mr. Durden occasionally gives a little weak liquid manure; but as the plants are young, they have not yet much exhausted the soil, and to give them too much stimulating matter would be to make them grow too exuberantly.

Pruning—thinning the Fruit.—In pruning, if the plants are trained on trellises, the branches should be kept thin, to allow the greater part of the leaves to be exposed to the sun. The fruit is generally produced at the tips of the small spurs or branchlets; therefore, it would be a positive injury to the crop to shorten any of these spurs, except it is desirable to increase their number. It sometimes happens that the most unpromising and naked-looking spurs produce the finest fruit. It is not a rare circumstance to see, at Hurst House, one of the Pink-fruited Shaddocks four or five pounds in weight, hanging on the end of a small spur no thicker than a common goose-quill. The operation of pruning is performed at any time when it appears to be necessary, always, however, taking care to have a succession of young wood coming in. In thinning the fruit, particular attention ought to be paid to the state of the tree, for the quantity of fruit must be entirely regulated by the vigour of the tree; no better rule can be laid down than that, for governing the operation of thinning. If a tree appears debilitated in the extreme, it must not be allowed to carry any fruit for an entire season. One great cause of debility is allowing the fruit to hang on the trees after it is ripe. When green fruit is required for confectionery purposes, a larger quantity of fruit may be left on the trees, but the quantity must always be proportioned to the capabilities of the tree.

Varieties.—Those who wish to cultivate the Orange-tribe for the sake of the fruit, ought to be very careful in making a selection of sorts—especially of sweet Oranges. The best way, perhaps, is to procure grafts, or young plants, from such varieties as have proved themselves to be good in other establishments, or proved plants from a nursery. Nothing is more likely to discourage a beginner than to find, after three or four years of careful culture, that his attention and expense have been thrown away on worthless varieties. In this case it will be found cheaper to graft, bud, or inarch better sorts on the worthless varieties, than to replace them by young plants.

Cleaning the Plants.—The greatest attention should be paid to cleanliness; the consequences of allowing insects to overrun a collection of plants, are familiar to every one acquainted with gardening. The Aphis attacks the tender shoots and young leaves; the Red Spider the more advanced foliage; and the Coccus hesperidum every part of the plant. Almost every gardener has his peculiar nostrum for destroying these animals; but a good preventive is cleanliness in everything about the plants. The Coccus may be brushed off, using a brush that is no harder than is just necessary to remove the insect. For the Thrip, Red Spider, and Aphis, a sponge and clean water will remove them all, if used before the insects have become very numerous. Fumigation should never be resorted to except in extreme cases. Cleanliness and attention will ultimately be found to be best and cheapest; as any mixture that destroys the insects, in general injures the plants.

Such is Mr. Durden's practice of managing Oranges, &c., and if it were more generally known and followed, there would be few complaints about the difficulty of cultivating this tribe.—*J. W. Jones, Knowsley.*

ENTOMOLOGY.

Agromyza Violæ (*the Pansy-fly*).—The genus of minute Diptera to which this fly belongs is distinguished from neighbouring groups by the neuration of the wings; and, as it does not accord with any of Meigen's or Macquart's descriptions, I have named it after the pretty plants it appears to be most attached to. Many of the Agromyzæ are undoubtedly inhabitants of aquatic plants, since I have found the pupæ of some floating on the water and of others fixed to reeds; but nothing of their economy

appears to be known to any author I have consulted. The pupæ to which I allude are like little shining shells; some are ochreous, others are of a pitchy colour, irregularly oval, and ringed, the incisures deeply cut, causing each ring to be convex. Something, however, is known of the habits of allied genera, the larvæ of Chlorops feeding upon seeds *in situ*, and those of Phytomyza residing in the receptacles of syngenesious flowers,* or under the cuticle of the foliage.† Is it not, therefore, probable that the little maggots of the Pansy-fly may live amongst the seeds in the germen of that flower, or is it a miner, feeding on the parenchyma of the leaves? It is to be hoped that the gentleman who has furnished us with the materials for this essay may be induced to pursue its history until he discovers the entire economy of this active and mischievous little animal.

What has already come under his observation is interesting to the florist, since he has ascertained that these minute flies deprive some of our most lovely flowers of their beauty. It appears that last May they were abundant, and subsequently became still more numerous, so that in August there were always three or four on each flower, and they did not disappear until the frosty nights of September cut them off. With the following account, was transmitted a Pansy-flower, which, when held up to the light, exhibited innumerable white and pale dots, of course most visible in the dark purple parts:—"During the last year a small fly made its appearance in the gardens about Manchester, which completely spoiled the more delicate flowers, by discharging the colours, and spotting the blossoms. The flowers I noticed which suffered the most, were those of the Pansy and Phlox Drummondii; whole beds of the former were so extensively attacked, that I could not gather a perfect bloom after an hour of sunshine. The appearance thus caused is not dissimilar to that of the Thrips, which was also plentiful that year. For a long time I was unable to find out how the mischief was effected, so insignificant in itself is the culprit. I first noticed these flies on a flower of the Carlo Dolce Pansy, which has the upper petals of a dark blue, and the lower ones white; it had just passed from the blue to the white ground, when it secreted a blue liquid, upon seeing which I immediately suspected that the mischief was owing to the operation of the flies, and subsequent examination proved I was correct. The manner in which the fly effects its purpose is by puncturing the flower with a small sting situated at the tail, and, afterwards drawing its head to the hole it has made, it sucks up the juice, and by this means completely extracts the colouring matter."

Before entering upon the description of the fly, it is necessary to state that neither sex is armed with a sting, but the female is furnished with a tubular oviduct for depositing her eggs, and the mouth is formed of a bilobed fleshy lip for sucking, similar to that of the house-fly, with two minute palpi, and a horny labrum; I therefore cannot explain the reason of the flies applying their tails first to the petal, as above stated.

Agromyza Violæ is shining black, and slightly bristly; the eyes are of a beautiful green when alive; the head and antennæ are of a bright orange colour; a spot on the crown inclosing the three ocelli, and the simple bristle of the antennæ are black; sides of thorax and scutellum sulphur colour, the latter black on the sides; wings ample, iridescent and transparent, the subcostal cell short, divided by a transverse nervure; three following longitudinal nervures nearly parallel, and extending to the outer margin; 4th longitudinal nervure greatly divaricating, connected with the 3rd at the middle by a transverse one, 2nd and 3rd united nearer to the base by a very short nervure: poisers yellow; legs pitchy; anterior tibiæ and tarsi variegated with rust colour; thighs of a sulphur colour on the underside in some specimens. The natural size is given at fig. 1; fig. 2 is the female in profile; fig. 3 the same flying: the males are rather smaller than the females, and the abdomen is narrower and more obtuse.

It is scarcely possible to suggest any mode for destroying these flies, especially until it is ascertained where the eggs are deposited; but prize Pansies might perhaps be preserved from their attacks by gauze-frames to cover over the pots, similar to those used for protecting meat against flesh-flies; but they ought to be made of more open materials, and of a suitable form: if the flies be bred from the plants, this would not prove efficient in many cases; a trial, however, might throw some light upon that part of their economy.—*Ruricola.*

Home Correspondence.

Asphalte Paths.—I saw last year in the *Chronicle* a plan of making a good path. It was by levelling the ground, and putting upon it coal or gas tar, and sifting upon the tar some very fine road-dirt, or sand. Having a yard which is given up chiefly to the play of some very rough lads, I was very desirous of knowing a plan by which a part of it might be kept in good order, at a cheap rate; for, not having a very sound bottom, in winter and in all wet weather it was a complete puddle; and as the kitchen-door opened into it, there was no possibility of any member of the family setting foot beyond the door-step without being almost over shoes in mud. As soon as possible after seeing the plan in the *Chronicle*, I availed myself of a dry day, to smooth a good large piece all round the door-way, and put on it a good coat of tar, and sifted very thickly on it some road-dirt; a few days after, when the weather permitted, I repeated the operation, and did so until it had in all four coats of coal tar, and as many of road-sand sifted on it. The whole time it was in hand was about six weeks, but it only occupied an hour or two each time, and was left about a fortnight after each coat, to settle. The path was never out of use—we could not spare it; but I had it so thickly covered with sand, that the tar never was trodden about; most of this sand was trodden into the tar in a few days. Perhaps I ought to say that every time I did it rain fell, and good quantities, always within twenty-four hours, and twice, as soon as it was done, but it did it no harm. It has stood the autumn, and winter weather has made no difference in it at all; it is always dry and always clean. It has been the subject of many inquiries, as to why that part of the yard was "so clean," "so dry," "so hard," "so different" from all the rest. I am so pleased with it, that I should use it as a flooring for any sort of shed or outhouse, in preference to any other materials with which I am acquainted. It has the advantage of cheapness, and the further advantage of being so easily done, that in tool-houses, greenhouses, and sheds, the flooring may be the work of the gardener himself (where only one is kept), or a common labourer. One gallon of tar will do well about two square yards; and as tar seldom costs much, it can never be dear. One thing more in its favour is that it is never cold to the feet.—*Cardinal Wolsey.*

Birds' Eggs.—For preserving the colour of these, in answer to "Egg," allow me to offer the following extract from "Waterton's Natural History." I have tried the plan and found it to answer:—He says, "In selecting eggs for your cabinet, always choose those which are newly laid; make a medium-sized hole at the sharp end, with a pointed instrument. Having made the hole at the sharp end, make one at the blunt, and let this last hole be as small as possible; this done, apply your mouth to the blunt end, and blow the contents through the sharp end. If the yolk will not come freely, run a pin or wire up into the egg, and stir the yolk well about; now get a cupful of water, and immersing the sharp end of the shell into it, apply your mouth to the blunt end, and suck up some of the water into the empty shell; then put your finger and thumb upon the two holes, shake the water well within, and after this blow it out. The water will clear your egg of any remains of yolk, or of white, which may stay in after blowing. If one suck up of water will not suffice, make a second, or third. An egg, immediately after it is produced, is very clear and fine; but by staying in the nest, and coming in contact with the feet of the bird, it soon assumes a dirty appearance. To remedy this, wash it well in soap and water, and use a nail-brush to get the dirt off. Your egg-shell is now as it ought to be, and nothing remains to be done but to prevent the thin white membrane (which is still inside), from corrupting; take a wine-glass and fill it with the solution of corrosive sublimate in alcohol, then immerse the sharp end of the egg-shell into it, keeping your finger and thumb, as you hold it, just clear of the solution; apply your mouth to the little hole at the blunt end, and suck up some of the solution into the shell; you need not be fearful of getting the liquor into your mouth, for, as soon as it rises in the shell, the cold will strike your finger and thumb, and then you cease sucking; shake the shell just as you did when the water was in it, and then blow the solution back into the glass. Your egg-shell is now beyond the reach of corruption; the membrane for ever retains its pristine whiteness, and no insect for the time to come will ever venture to prey upon it. If you wish your egg to appear extremely brilliant, give it a coat of mastic varnish, put on very sparingly with a camel-hair pencil; green or blue eggs must be done with gum arabic: the mastic varnish is apt to injure the colour." If farther information is required, I would refer your correspondent to the work itself, in which there is much that is useful on this subject.—*J. McI., Hillsborough.*

Heckfield-pit.—The proposed improvement of this pit, mentioned at p. 181 of this year, will certainly give a more direct heat into the bed, but in this the detached pier possesses no advantage over the cavity wall, through which a mean temperature sufficiently warm for the growing of Melons is constantly conveyed to the bed, and into the earth on which the plants grow. Heat finds its way through the front wall to the outside border of a hothouse, having a flue or hot-water pipe inside. On the same principle it finds its way from the cavity into the bed, where a kindred heat already exists; the highest degree is given out along the top of the cavity in the back, against which the roots and the earth press, and where, by heightening the lining, the heat is increased. After four years' trial of the pit, I find that it possesses all the useful advantages, and none of the disadvantages, attendant on the detached pier; which, if adopted, would destroy the close-box form of the pit, so well adapted to general convenience. However, to accommodate the pit to purposes where a more direct heat is requisite, instead of the cavity-front wall have hollow piers, and attach the piers with brick on edge, through which a direct safe heat is conveyed to the bed. By this alteration the pit will retain its present proportion; and it may be found an improvement; but I consider the detached pier the reverse.—*Thomas Berry.*

Rats.—(How to clear premises of any number, by catching them alive in box-traps that open and shut at each end by a trigg or baiting board in the centre).—Feed the rats for three or four nights successively, leaving the traps fixed open and baited with the following paste, so that they may go in and out and feed at their ease. This they will do regularly; and if there is a considerable number they will fight, quarrel, and look as anxiously for the bait as domesticated animals would do. If the rats are numerous and the premises extensive, take 4 lbs. of bread crumbs, 4 lbs. of flour, half-pint of treacle, one tea-spoonful of essence of Anise, and half a tea-spoonful of essence of Musk; mix the whole well together, and bait the traps as above recommended for three or four nights. If the rats are numerous, several traps should be so prepared. On the night the rats are to be taken, bait as usual, having the traps set for catching; fix a wire-cage over the end of the box-traps (which should be all of one size), for the purpose of driving them into, out of the box-trap, when they are caught. This is done by raising the end so covered with the cage-trap; when all is quiet, and these things attended to, I have seen a great number caught in three or four hours. Baiting and setting the traps again for two or three nights in this way, with strict attention, a great number may be caught.—*Observer, J.*

Bees.—I beg to inform Bee-keepers that I can vouch for the truth of the statement that the Polyanthus yields more nectar which the Bees convert into honey than any other plant. I cultivate them round all the borders, as they are the earliest and most valuable Bee-flower we have.—*W. W.*

Rabbits—Game Laws.—The correspondent who recommends arsenic as a remedy against rabbits, &c., may be a very sagacious person, though sufficiently unacquainted with the law. As he may lead others into the infraction of it, I inclose an extract from the Game Act:—"And if any person, with intent to destroy or injure any game, shall at any time put or cause to be put any poison or poisonous ingredient on any ground, whether open or inclosed, where game usually resort, or in any highway, every such person shall, on conviction thereof before two justices of the peace, forfeit and pay such sum of money, not exceeding ten pounds, as to the said justices shall seem meet, together with the costs of conviction."—*A Sportsman.*

Rabbits.—Visiting, some time ago, in Ireland, I observed numerous patches of Cauliflower plants growing in the shrubberies and pleasure grounds. These patches, the gardener informed me, were for the purpose of destroying rabbits. He powdered the under sides of the leaves with arsenic, which, he said, answered the purpose very well. If fresh gathered leaves of Parsley, or of any of the Brassica tribe are powdered with arsenic, and if the ground on the sides of the fence is also strewn with it, numbers of the rabbits will soon be destroyed; this should be done in the evenings before they come out to feed.—*J. G.*

Whitney's Composition.—Having lately visited Shrewsbury, I saw the house which was erected by Mr. Whitney. It was covered with book muslin, coated over with his chemical waterproof composition. I was struck with the bright, clear light admitted, which I imagine is quite sufficient for plants generally. The house has two compartments, one a stove, the other a greenhouse; both are heated by a hot-water apparatus. In the stove were Pines, Vines, Melons, Cucumbers, and various other things, all of which were looking remarkably strong and healthy. The day being very hot, the thermometer stood at 110°, but there was not the least appearance of flagging in anything. There were cuttings of various plants in the pit, which were lately put in, but they scarcely appeared to droop. In the greenhouse were Pelargoniums, Heaths, Fuchsias, and other plants, all of which were also looking equally vigorous. A few pots of Mignonette were standing on the floor at least seven or eight feet from the roof, yet the plants seemed to be as strong as if they had been growing on a shelf near the glass of a common glazed roof. Such a composition will prove of great value to gardeners, and it will in a short time, to a great extent, supersede the use of glass. For protecting wall trees, covering temporary pits, houses, &c., this material will be found very useful. The cottager will also be enabled, by means of this, to raise Potatoes, Radishes, Cucumbers, and many other things early.—*S. Barnes, Upby Park, Bridgenorth.*

Covering for Flower-beds.—In the Calendar of Operations, "W. P. A." advises covering the clumps in flower gardens with short Grass, to prevent the soil getting dry in hot weather. It is an excellent plan to cover clumps in summer, but Moss is far superior to short Grass for this purpose, where it can be procured; as Grass soon gets yellow, and has an unsightly appearance, whereas Moss, if skinned off in large patches, and laid neatly down, has a fine effect. By occasionally watering it in dry weather, it will keep fresh for a season, and preserve the ground moist under it, which is very essential for plants when they are growing.—*K.*

Vitality of Pollen.—In the spring of 1840 I devoted my attention to the fertilisation of Rhododendrons. I gathered pollen from the early flowering hybrids, and folded it up in small pieces of red blotting-paper; with this I impregnated the common sorts as they came into bloom, and the result proved that the pollen would retain its fertilising principle for a period of two months. In 1841, by way of experiment, I gathered pollen from Rhododendron Smithii tigrinum, and folded it up in the way above described, taking care to keep it in a dry place. In the spring of 1842, I prepared a truss of flowers of Rhododendron ponticum, and fertilised it with the pollen gathered in 1841, and, to my astonishment, the capsules swelled and

* Curtis's Brit. Ent. fol. and pl. 393.
† Royal Agri. Journ., v. 3, pl. D. pp. 31 to 33.

perfected seed. As I took the precaution to cut off every other bloom that was in the Nursery at the time, the fact is fully established that pollen will keep good for at least twelve months.—*T. Jackson, Cross Lanes Nursery, near Bedale.*

Luculia gratissima.—In propagating this I take a piece of light peat and break it quite fine, I then add about one-third of fine silver-sand; I mix this well together, and taking some small thumb-pots I place one crock at the bottom of each pot, and fill them with the above compost about three parts full; I press this down firm, and take some little sticks and put down in the centre of the pots. I then select cuttings of the half-ripened wood, and placing one in each pot I tie them up to the sticks in the centre of the pot, and fill the remainder of the pot with silver-sand. When this is done I give them a good watering, to settle the cuttings. I then take a large pot and fill it half-full of draining and the remainder with sand or gravel, and then plunge four of the little pots in this large one, and place a bell-glass over them. The whole is then plunged in bottom-heat, and in about a month the cuttings are rooted and fit for potting off into small 60-pots. I then keep them close for about a week or so. There is a second species that has lately been raised from seed, sent to this country by Dr. Royle, which strikes much readier than gratissima. The habit of the plant is strong, and the foliage is dark-green; but judging from a native specimen of the flower, I should say it was very inferior to L. gratissima. It has also been raised from seeds sent to Chatsworth by Mr. Gibson, and although they have had the plant four or five years, it does not show any symptoms of blooming.—*Amicus.*

Wireworms, &c.—Having occasion to set a common brick-trap for birds, I have accidentally discovered a readier method of trapping the wireworm, and other destroyers of a similar nature, than by the "skewer-trap" recommended some time ago. Either the shelter of the bricks, or the proximity of the bread-crumbs intended for the birds, have attracted the reptiles amazingly; for I find both wireworms and snake-millipedes under the bricks day after day in great numbers. I could not have conceived the ground sheltered so many, and I am no longer surprised at the great destruction of plants (particularly Brussels Sprouts) that I have sustained by their means. —*Senex.*

Vines, their habitudes. — There is a Vinery at Enfield which was planted 10 years ago. The Vines grew very strong during the first two years; they were allowed to bear half way up the rafters the first year after they were planted. In the second year they carried a full and heavy crop, and every year since they have continued to produce good crops. This year he commenced to force on the 1st of February, which is about six weeks later than usual. The Vines broke very strongly, and apparently showed well for fruit, but all the expected bunches became flat Cockscomb, and barren shoots. Enfield lies very wet. Two or three times every season the water comes up to the roots of the Vines, and even over the surface of the border, and this cannot be remedied except the house is raised. The border is only 2 ft. deep at the back, and 1 ft. 6 in. in front.—*A. Parsons, Enfield.* [We presume that the cause of failure is perhaps partly owing to the Vines not having heat at their accustomed period of breaking; but most probably the wood of last season, though apparently good, has been imperfect from excessive moisture, the quantity of rain having been nearly one-third more than usual.]

Vines.—In a late Number there is a curious statement respecting the unfruitfulness of a branch which is trained horizontally to the next rafter of "R.P.'s" Vine, while the main stem, which is trained upright is prolific. I conceive the unfruitfulness must be owing to some other cause than merely a difference in the temperature, which cannot be great on an adjoining rafter. I have seen shoots from Vines that were trained on a wall introduced into a house without injuring the fruitfulness of the outside branches, even although weeks intervened between the bursting of their buds. I have also had Vines in a Pine-stove from which I have trained a young shoot (proceeding from a hole in the wall where the Vine entered), to the top of the house before a bud broke; yet when the buds did break they showed no disposition to become tendrils. I suspect "R. P.'s" rod, which is unfruitful, must have borne too heavy a crop last season; possibly it was a young rod then, and exhausted itself in bringing its burden to maturity. I have a Vine trained in the same manner, which is this season unfruitful, because it was allowed to bear all it would last year, as it was to be cut out. I agree with Mr. Roberts in the points he recommends "R. P." to observe; but I think he attaches more importance to disbudding than it has any claim to. I tried it on some Vines in pots, and likewise on the shoots on one side of several old rods that were trained up the rafters and pruned on the spur system; but I did not find that it caused the lower eyes to swell more on that side than they did on the other, nor have they burst with more "giant strength." I imagine that the whole mystery of Grape-growing consists in having a warm rich soil, houses that will admit plenty of light, no more nor longer shoots than can be exposed to it, and a sufficiency of air to harden and mature the wood.—*J. Murdoch.*

Potatoes.—In the *Chronicle*, some time ago, there is a notice respecting a cottager who raised four crops of Potatoes on the same piece of ground during the past season. Part of these were exhibited at the Norwich Horticultural Show. I saw the Potatoes, and could find no fault with them. They were an early kind, and were planted about the usual time, in rich soil. A few days before the tubers were fit for use, the tops of the stems were laid in the ground, and when they had struck root they were cut off from the original, and became fresh plants, which produced the second crop. This was again repeated twice during the season, and made up the four crops. This plan of laying Potatoe-tops is a better way to increase scarce varieties than by cuttings. The last crop may be left in the ground as a substitute for early Potatoes during winter and the following spring. Respecting Potatoes raised in this way, "G. M." says, at p. 102:—"I sent three-quarters of a peck to Norwich Market, expecting that a high price would be given for such rarities; but to my disappointment I was informed that 'sprout Potatoes would not sell.' It was said they were of too dark a colour to be new Potatoes. How is this to be remedied? They are fair as May roots when properly boiled." Possibly they might be a little injured by the carriage; but those erroneously called new Potatoes are not equal in quality to those produced in the regular manner.—*J. Wighton.*

Miscellaneous.—*P. Lawson* remarks, that he had two seedling Fuchsias growing in the south window of a room. The pot in which they were was accidentally knocked over, and both plants were broken off by the roots. He states that he put them in again as cuttings, and placed them in the same situation, where they are now both in a healthy growing state. The leading shoot of one of them was also broken off, and the plant, in consequence, is sending out shoots all round, which he imagines is preferable to a single stem.

Functional Disease.—"Der Greif's" assignment to so small a type is sufficiently significant of the Editor's resolve to bring the discussion to a conclusion, in which, as Rasselas says, "nothing is concluded." "M. D.," with thanks for many courtesies, will take heed to this gentle notice of "diminuendo." "M. D.'s" respect for the argumentative ability of his opponent, suffers no abatement because that argument does not bring conviction. The love of truth above all other things he believes to be reciprocal: but what is truth? Certainly not that which any man troweth, unless supported by evidence which no other can gainsay. "M. D." admits the full force of the objection to a purely or rather solely mechanical exposition of the action of living organism; and in his last article he endeavours to reply to that objection; still maintaining, that for functional purposes, such organism is ruled by the ordinary laws of mechanics, having superadded a provision for supply and waste, independent of, and having no relation to the offices in which it is engaged,—machinery, like Milton's chariot-wheels,

"Self moving,
Itself instinct with spirit,"

ever wearing away, and ever renewed, but always the same. All the organs of the body are officially automatic,—so many furnaces, alembics, churns, spinning-jennies, with a life, that is, a motion, superadded, with which their functions have no, or only a secondary concern, the materials may change, but fixity of form ensures continued function. How healthy organs may do unsound work, and how change of condition may differ from change of structure, respect for "Der Greif's" forbearance, and the Editor's recommendation, forbids farther discussion.

Societies.

HORTICULTURAL SOCIETY.

April 16.—R. W. Barchard, Esq., in the chair. A. Bayley, W. R. Browne, T. Coventry, and E. N. Buxton, Esqrs., were elected Fellows.—Mr. H. Hunt sent specimens of his patent flower-pot; the advantages of which consist in affording an excellent drainage and allowing air to circulate freely about the roots. This is effected by means of a deep rim, which is notched out, leaving only as much as the pot will stand on attached to the bottom, which has also holes in it. By this contrivance worms are also effectually kept out.—From Messrs. Henderson, of Pine-apple-place, was a collection of plants containing Camellia Bruceana, a pretty dark rose-coloured variety; Cestrum roseum, which in habit something resembles Habrothamnus fasciculatus; Daviesia Frazeri; Dillwynia glycinifolia, Indigofera australis, an old plant, which is very suitable for early forcing; and Erica lactiflora, having beautiful small pure white blossoms. From the same collection was a specimen composed of Azalea lateritia, and A. Gladstanesii, which were inarched upon the old A. indica. By means of this a very pretty dwarf plant was obtained, which was covered with showy red and white blossoms. There were also from the same place a plant of the double white Azalea, fifty varieties of Hyacinths in pots, Melia Azedarach, and Jacaranda mimosifolia, not being more than 18 inches high, which is very seldom seen in flower in such a young state. It was stated that during winter this plant had been kept in a cool house, and received no water for about three months. It was then placed in a brisk heat, and soon afterwards the flowers began to appear. A Knightian Medal was awarded for the Camellia, the Azalea, and Hyacinths.—Mr. Kennington, gardener to F. G. Cox, Esq., sent Epidendrum machrochilum, the showy Dendrobium nobile, Cymbidium lancifolium, the well-known Cattleya Skinneri, a good specimen of Phaius grandifolius, the rare Peristeria Humboldti, with curious chocolate spotted flowers, and a pretty plant of Oncidium altissimum. From the same collection were also a small but well-grown plant of the old Eutaxia myrtifolia, likewise plants of Chorozema Henchmanni, Broughtonia sanguinea, Platylobium formosum, and a Cineraria, named Haywardii. A Certificate was awarded for the Cattleya Skinneri.—From Mr. Hally, of Blackheath, was a seedling Epacris, which was raised from seed that had been received from Van Diemen's Land, where this tribe abounds in a wild state. It was imported under the name of E. grandiflora alba; but was slightly different from E. nivalis. Along with this were two boxes of Camellia blooms and a seedling Cineraria, called Princess Royal. — Mr. Dawson, of Brixton-hill, sent a large beautiful specimen of Erica Hartnelli, for which a certificate was awarded.—From Mr. Robertson, gardener to Mrs. Lawrence, were Pultenæa subumbellata, in good condition; a pretty plant of Boronia pinnata; Epacris attenuata alba; a very large showy specimen of the purple Azalea indica; Gastrolobium speciosum, a pretty greenhouse plant, quite newly introduced from Swan River; a large specimen of Coleonema tenuifolium, and a small plant of Elæocarpus denticulatus, having small white drooping blossoms. From the same collection were also Oncidium altissimum, an enormous specimen, having six tall flower-stems covered with yellow and brown blossoms; Coryanthes speciosa, having curiously-shaped flowers, which are smaller but very like those of C. macrantha; likewise plants of Cattleya Skinneri, Satyrium cucullatum, Crinum undulatum, Aerides virens, and Epidendrum bicornutum. A Knightian Medal was awarded for the Oncidium altissimum, Coryanthes speciosa, &c.—Messrs. Youell and Co. sent two seedling Cinerarias, named Perfection.—From Mr. Standish, of Bagshot, were four pretty spotted Calceolarias, named Speculum, Phenomenon, Virtuose, and Preceptor.—The Very Rev. the Dean of Manchester sent seven specimens of Camellia blooms, named Picta, Candor, Pumila or Circe, lactescens, Ulantha, Victrix, and Proteus. Of these, Candor was the best, having the petals well arranged; the colour was pure white; a Certificate was awarded for it. — From Mr. Hutchison, gardener to E. J. Shirley, Esq., was a dish of excellent Peaches, which were forced on small trees growing in pots. They were apparently the Noblesse, and were very remarkable specimens, at this season, considering the late and unfavourable spring; a Knightian Medal was awarded for them. O. F. Meyrick, Esq., sent a dish of fine looking ripe Cherries; a Banksian Medal was awarded for them.—From Mr. J. Davey, gr. to G. Smith, Esq., were four fine large specimens of Citrus medica.—From the garden of the Society were, Oncidium luridum guttatum, O. Carthaginense, Epidendrum selligerum, the old Illicium floridanum, Acacia hispidissima, Azalea indica phœnicea, and Berberis pallida, which is a rare species that was sent from Mexico by Mr. Hartweg. It is not hardy, and requires to be kept in a greenhouse. From the same place were, Cypripedium pubescens, a hardy North American Orchis, which grows abundantly in the woods of Canada and about Montreal; Clerodendrum hastatum, having large halbert-shaped leaves, the undersides of which are of a fine purplish brown, and Spiræa Reevesiana, a handsome hardy shrub, introduced from China, having pretty white blossoms. It grows freely in the open air, and will form a good addition to arboretums.

COUNTRY SHOW.

Hampshire Horticultural Society, March 14.—This was the first meeting for this year. There was an excellent supply of plants, consisting of Camellias, forced American plants, Roses, Cut Flowers, Hyacinths, &c. From Sir T. Baring, Bart., a fine collection of Camellias (small plants, but well grown), and other flowers from C. Deane, Esq.; Stove Plants, Hyacinths, and a Miscellaneous Collection from J. T. Waddington, Esq.; Tree Violets from the Hon. Mrs. A. Legge; a fine Collection of Stove and Green-house Plants, Amaryllis, &c., from the Rev. G. C. Rashleigh; Cinerarias, Tree Violets, &c., from Mr. Wickham; a fine Specimen of Chinese Azalea, from J. B. Wall, Esq.; a Specimen of Dendrobium, from J. Fleming, Esq.; Hyacinths, from W. Barnes, Esq.; a Miscellaneous Collection, from C. Seagrim, Esq.; Fuchsias, Anemones, Cinerarias, Violets, Seakale, &c., from the Rev. the Warden; Rhubarb, from W. J. Campion, Esq.; Stove and Green-house Plants, a Miscellaneous Collection, and a brace of Cucumbers, from the Rev. F. Beadon; Pine Apple, Cucumbers, and Seakale, from W. Stride, Esq.; Green-house Plants, Cinerarias, and Apples, from the Rev. C. Bonnett; Miscellaneous Collection of Fruits, in which were some well-kept Pears, Potatoes, Seakale, and three varieties of very fine Cucumbers, H. F. H. Holloway, Esq. Plants.—*Single Specimens.*—*Camellia reticulata*, D.S. medal, Sir T. Baring; *Chorozema varium*, B.S. medal, *Tropæolum brachyceras*, G.S. medal, Rev. G. C. Rashleigh; *Azalea Smithii coccinea*, ditto, J. B. Wall, Esq.; *Fuchsia splendens*, B. medal, Rev. the Warden; 6 *Stove Plants*, B.S. medal, Rev. G. C. Rashleigh; 6 *Green-house Plants*, G.R.B. medal, Rev. F. Beadon; 4 *Ericas*, B. medal, Rev. G. C. Rashleigh; 4 *Camellias*, G.S. medal, Sir T. Baring; 4 *Epacris*, B. medal, Rev. G. C. Rashleigh; 6 *Hyacinths*, G.R.B. medal, Sir T. Baring; 6 Ditto, B. medal, Mr. W. Barnes; 12 Ditto, B. medal, J. T. Waddington, Esq.; *Cut Flowers*, B.S. medal; 4 *American Plants*, G.R.B. medal, Sir T. Baring; 3 *Climbers*, G.R.B. medal, Rev. G. C. Rashleigh; *Anemones*, in collections, B. medal, Rev. the Warden; 2 var. *Bulbous Plants*, G.R.B. medal, Rev. G. C. Rashleigh; 4 var. *Cinerarias*, B. medal, Mr. Wickham; *Roses*, in pots, G.R.B. medal; *Azaleas*, B. medal; Ditto, B. medal, Sir T. Baring; *Violets*, G.R.B. medal, Mr. Wickham; *Miscellaneous Collections*, G.S. medal, Rev. F. Beadon; Ditto, G.R.B. medal, Mr. Ralfe; Ditto, B. medal, C. Seagrim, Esq. Fruits.—*Pine Apples*, G.R.B. medal, J. T. Waddington, Esq.; *Miscellaneous*, ditto, H. Holloway, Esq.; Ditto, ditto, Rev. the Warden. Vegetables.—*Cucumbers*, G.S. medal, H. F. Holloway, Esq.; Ditto, G.R.B. medal, Mr. Stride; Ditto, B. medal, Rev. F. Beadon; *French Beans*, ditto, J. T. Waddington, Esq.; *Potatoes*, ditto, *Seakale*, ditto, H. F. Holloway, Esq.; *Rhubarb*, ditto, W. J. Campion, Esq.—The medals awarded to the successful candidates are denoted by initials in the foregoing list, and signify as follows:—S.G., silver gilt, 15*s.*; D.S., dead silver, 12*s.* 6*d.*; B.S., bright silver, 10*s.* 6*d.*; G.S., German silver, 7*s.* 6*d.*; G.R.B., gilt rimmed bronze, 5*s.* 6*d.*; B, bronze, 3*s.* 6*d.*

Reviews.

Scenes and Tales of Country Life, &c. By E. Jesse, Esq. 8vo. Murray.

What a store of pleasant anecdotes, from the pen of so agreeable a writer as Mr. Jesse, does this title promise! What golden legends of trees, and birds, and beasts! What curious anecdotes of all that moves and lives upon the earth! The very vagueness of the book provokes a curiosity which our experience of the author's ways assures us will be amply satisfied. We will not attempt to analyse that which defies analysis; but we shall occasionally borrow Mr. Jesse's anecdotes for our own pages, and if they do not lead the reader to desire a better acquaintance with him, why, nothing that we can say will do so. He is a capital gossip upon subjects ever fresh and ever new. His architectural jackdaw's nest is, in itself, a theme for the comment of a volume.

On Fertilizers. By C. W. Johnson, Esq. 2d Edition. 8vo. Ridgway.

The 1st edition of this work was published in 1839, and it proved one of the most useful books of reference in the Agricultural library. Five years, however—and especially

ge such years of experiment as the last—have very considerably altered the views of farmers as to some manures, and have introduced to their notice others, the very names of which were till lately unheard of. What he regards as the most important facts connected with the advance of this branch of knowledge, the author has collected into 150 new pages, of which between 30 and 40 are occupied by guano. There is also a new chapter on the means of rendering manures more portable and applicable by the drill, and another on the manures adapted for different soils.

A thoroughly good work on manures cannot yet be written. The subject is too new, notwithstanding its antiquity; years of well-directed inquiry are demanded from farmers to solve some of the most simple problems; and chemists must labour hard on their part, to investigate the causes of the conflicting results which farming experiments are sure to produce. It is worth the consideration of the Agricultural Societies, whether the solution of such important inquiries would not be much advanced if a series of well-arranged questions were printed and circulated among farmers, who would thus be led to work with a unity of purpose that at present is greatly needed. In the meanwhile, Mr. Cuthbert Johnson's work will maintain its ground as the best collection of facts that has yet been compiled.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

STEPHANOTIS FLORIBUNDA. Free-flowering Stephanotis. (*Evergreen climber.*) Asclepiadaceæ. Pentandria Digynia.—No plant could have been more properly called "free flowering" than this most enchanting climber, for it bears a large cluster of flowers from the axil of every leaf, and these are developed on plants not more than six inches high, while there is an almost interminable succession of them. Indeed, there is scarcely any of our stove favourites which can compete with it in the profuseness of its blossoms. We find, from the "Botanical Magazine," that its native country is Madagascar, and that Mrs. Lawrence, of Ealing Park, whose celebrated collection is so rich in really ornamental plants, had the pleasure of introducing it to England. It is next to impossible to overrate its merits, they are so essentially sterling. Besides having a most elegant climbing habit, it bears dark shining foliage of a pleasing order, and from the axils of this the delicate, creamy-white blossoms are protruded in large umbels. The texture of the flowers being very firm, they last a considerable time, and their odour is exceedingly delicious. As a plant for training over the roofs of stoves, and especially of Orchidaceous houses; or for growing in a pot, and twining round any kind of trellis; or for keeping in a small state supported by a stake, as an erect shrub, it is almost equally interesting. But, though we have said that it flowers abundantly while very dwarf, this is only when it is appropriately treated; as some cultivators can hardly get even large specimens to bloom well. To ensure an early and continued display of flowers, the young plants should be raised from the upper shoots of the specimens that have exhibited high blooming propensities. A cutting taken from a luxuriant plant which grows vigorously and flowers but seldom, will not so speedily make a free-blooming specimen as one taken from a plant that has already manifested a disposition to bloom freely. The soil is another of the things which affect fertility. It must not be rich; nor should the pot be deep or large. If the roots lie near the surface of the soil, the blooming power will be increased. No conditions suit the plant so well in summer as a warm, moist, close atmosphere, like that of an Orchidaceous-house. But it is indispensable that it be kept cool and dry through the winter, otherwise it will not blossom well. The species is increased by cuttings, which, as before hinted, should be made from the points of the young flowering shoots. —*Paxton's Magazine of Botany.*

ERANTHEMUM PULCHELLUM. Pretty Eranthemum. (*Evergreen Shrub.*) Acanthaceæ. Diandria Monogynia.—Combined with the disposition for winter flowering, this species has an erect bushy habit, without any tendency to become straggling, or naked in the lower part of the stem. On the contrary, it is clothed with leaves of a full deep green, and of considerable breadth, down to the very edge of the pot, if any attention at all is paid to its culture. The intense brightness of its sky-tinctured blossoms lends a showiness during the first three or four months of the year, which is the more acceptable from having fewer competitors than if they were produced at a more advanced period. To realise its highest character it must be grown in a roomy pot, or planted in a border. When grown in pots, it must be planted in a more retentive soil than is usually employed, and nothing can be better adapted than a strong loam, such as is procured from the decayed sward of a pasture. A liberal supply of water is indispensable to its vigorous growth. But perhaps it is seen to the greatest advantage when planted in the border of a stove, where its roots are unconfined, and it can grow without restriction. At Chatsworth it is planted in the borders of the large stove conservatory, where it forms bushes several feet in circumference, and produces a profusion of flowers for several successive months. After flowering, the shoots should be pruned back to within an inch or two of their base. It is a native of the coast of Coromandel, in the East Indies, from whence it was sent to Kew gardens towards the close of the last century. It may be increased readily from cuttings, put in sand, in a slight bottom-heat; and if allowed sufficient pot-room, these will make handsome bushes in the course of a season.—*Paxton's Magazine of Botany.*

GARDEN MEMORANDA.

Spofforth near Wetherby.—A lovely new flower is blown this morning, of which only one was raised, from Narcissus poeticus by N. moschatus minor, the N. candidissimus of Redouté. The leaves are now nine inches high, $\frac{1}{4}$ in. wide, glaucous; the stalk 6 in.; the peduncle precipitately curved down; the tube green, $\frac{5}{8}$ths in. long, equalling the spathe, and hanging at the distance of a quarter of an inch from the stalk; the limb white, acute, $\frac{3}{8}$ths of an inch long, forming a horizontal star; the cup at first opening faintly, tinged with yellow, $\frac{5}{16}$ths in. long, $\frac{7}{16}$ths in. wide, irregularly six-lobed, and so much indented as to look almost fringed; anthers slender, all standing out of the tube, equalling the style, shorter than the cup; pollen yellow, abundant; scent agreeable, but weak. It would have served Mr. Haworth for a new genus, if he had been alive. Also just expanding a dwarf robust mule from Ajax minor, (the least daffodil) by Hermione, States-General of the shops, with two large creamy pale-yellow flowers, genus Diomede, of Haworth. Several editions from the Yorkshire Daffodil by different varieties of N. poeticus, all yielding a smaller and paler form of N. incomparabilis, which comes from a larger and deeper coloured Daffodil of the South of Europe. Seedlings from Ajax minor, by Maximus, are also in flower, exhibiting great diversity from the same pod, the largest having the cup long, and not in the least recurved.—*W. Herbert, April* 11, 1844.

Collier's Wood, Tooting.—The heath-house at this place is filled with many fine young plants of that handsome tribe. On the stage, among them we particularly observed a bushy well-grown plant of Pimelea spectabilis. It measured about 7 feet in circumference, and 1 foot 9 inches high, and Mr. Bruce, who is gardener there, informed us that the plant was only two years old. It was grafted on P. decussata, which appears to make an excellent stock for this species, which is one of the most handsome of our Swan River Shrubs. The plant was not in bloom; but its large well-swelled flower-buds promised an abundant display of its showy blossoms. This species is not difficult to cultivate; it thrives better, however, and grows faster when grafted on some of the other kinds than on its own roots. With regard to soil a mixture of peat, loam, leaf-mould, and sand suits it well. When it is grown in a pot to the same perfection as this plant, it forms a fine object for the stage of a greenhouse; but it does best to be planted out in the bed of a conservatory, where we have seen it in great perfection. The young wood is sometimes topped after it has advanced a little in growth, in order to make the plant bushy; but this is a bad practice as the shoots come weaker, and do not produce such large flowers. In this house also were specimens of Aphelexis humilis, which, when well grown, are showy greenhouse plants, requiring nearly the same treatment as Heaths, and like them succeeding best in an airy situation. A plant of Tropæolum brachyceras, trained over a wire trellis, was producing its bright-yellow flowers in abundance; and here Erica grandinosa, which is an excellent Heath, was blooming profusely. The greenhouse was gay with Acacias, Azaleas, Camellias, &c. In the stove, among others, were in bloom, Dendrobium pulchellum, the showy D. nobile, a well-grown plant of Euphorbia splendens, and the useful E. jacquiniflora, which cheers us during the whole winter with its fine bright scarlet blossoms.

Miscellaneous.

The Chemistry of Cultivation. By Professor Liebig.—How is it possible, it may be asked, that there could ever be any doubt as to the part which the soil and its principles perform in the development of vegetables? or that the mineral principles of the plant could ever be regarded as neither necessary nor essential? There has also been observed on the surface of the earth the same circulation—a continual exchange—a perpetual disturbance and restitution of equilibrium. The observations in Agriculture show that the augmentation of vegetable substances, on a given surface, increases with the introduction of certain bodies which *were originally principles of the same surface of land*, which the plant has removed from it; the excrements of man and animals proceed from plants; and these are precisely the substances which in the vital act of the animal, or after its death, resume the form which they possessed as principles of the soil. We know that the atmosphere contains none of these substances, and that it cannot restore them; we know that their abstraction from the soil entails an inequality of production, a want of fertility; and that we can, by the addition of these substances, re-establish and increase fertility. After such numerous and striking proofs relative to the origin of the principles of animals and plants, to the utility of the alkalies, of the phosphates, and of lime, can the slightest doubt exist as to the fundamental principles of rational Agriculture? In fact, has the art of Agriculture any other basis than the re-establishment of the disturbed equilibrium? Can it be imagined that a rich and fertile country, possessing a flourishing commerce, which for ages has exported the products of its soil under the form of cattle and corn, can retain its fertility, if the same commerce do not return to it, under the form of manure, the principles removed from its fields, and which the atmosphere cannot replace? Would not such a country suffer the same fate as the lands, formerly so rich and fertile, of Virginia, where neither Wheat nor Tobacco can any longer be cultivated? The large towns of England consume the products of English Agriculture, and, besides, that of foreign countries. But the principles of the soil indispensable to the plant, and which are derived from an immense surface of land, are not returned to the soil. Regulations which have their source in the manners and customs of this people, and which are peculiar to this country, render it difficult, and, perhaps, impossible, to collect the immense quantity of phosphates (the most important of the mineral principles of the soil, although their proportion in it is very small), which are daily conducted into the rivers under the forms of urine and solid excrements. We have seen the English fields thus exhausted of phosphates present a very remarkable case; we have seen the exportation of bones (phosphate of lime) from the Continent double their product, as by enchantment. But the exportation of these bones, if it continue on the same scale, cannot fail gradually to exhaust the soil of Germany; the loss is so much the greater, as a single pound of bones contains as much phosphoric acid as a *quintal* of cereals. The Thames, and the other rivers of Great Britain, carry away every year thousands of quintals of phosphates. Thousands of quintals of the same substances which come from the sea, are returned into the country, in the form of guano. The imperfect knowledge of the nature and proprieties of matter gave rise, in the days of alchemy, to the opinion that the metals proceeded from a seed. The crystals and their ramifications were regarded as the leaves and branches of the plant-metal, and all efforts tended to find the seed and the earth appropriate to its development. Without giving anything in appearance to an ordinary vegetable seed, it was considered to produce, by its development, a stem, and a trunk bearing flowers which produced other seeds. If the seed-metal had been possessed, similar hopes might have been entertained. These ideas could arise only in a time when the knowledge of the atmosphere was next to nothing, when the part which the earth and air take in the vital acts of plants and animals was unknown. The chemistry of the present day prepares the elements of water, composes this water with all its properties by aid of these elements, but it cannot create them; it can only extract them from water. The artificial water has been water before. Many of our agriculturists resemble the ancient alchemists. If the latter sought for the philosopher's stone, the former seek for the wonderful seed which, without the addition of nourishment to their soil, scarcely sufficiently rich for indigenous plants, should produce a hundred-fold. The observations made for ages, for thousands of years, cannot preserve them from the illusions always arising. The knowledge of true scientific principles alone can give the power of resisting such errors. In the earliest age of natural philosophy, it was water alone that developed organic substances: then, it was water and certain principles of the air; now, we know with the greatest certainty that it is necessary to add other principal conditions furnished by the earth, to the latter two, in order that the plant may have the power of being reproduced and multiplied.—*From the Chemist.*

(To be continued.)

New Water-colour.—A lady at Palermo wishing to make a drawing of the beautiful Bougainvillæa spectabilis, was at a loss for a rose-colour that would match it. It struck her, however, that the juice of the Opuntia fruit would do, and upon trial she found it yield a most beautiful rose-colour, which was as readily worked as if it had been prepared in a colour-shop; and now, after a year, it is as fresh as ever. It would be worth while to get the Sicilians to make up the juice of the Opuntia into cakes.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

THE general potting is now about finished, and many of the first potted plants have made a considerable growth; climbers and specimen-plants, also, have received the direction and shapes they are intended to fill up this season; propagation and seed-sowing are nearly over in this department, and all the bulbs and other plants at rest through the winter are now in growth, so that only the common routine of watering, giving air, smoking, or otherwise cleaning plants, and training them, will be necessary for some time. Be very sparing of the fires, and keep the atmosphere very moist in fine sunny weather. The thermometer may have a range of 30° or 40° in the 24 hours—say, from 55° to 60° in the morning, 90° and upwards at noon, and from 70° to 75° at 6 P.M.

Conservatory.—This is a good time to cut back duplicate climbers, so as to get them into flower in succession. Where new Conservatories have been lately planted, or old ones rearranged, a totally different management to the common rule must be pursued for the next two months: the object is to get the plants to make a vigorous growth early in the season, and take a strong hold of the new soil, afterwards there will be plenty of time to ripen them off long before winter. For this end, you ought to keep the house more like a stove or forcing-house from this time, only giving air from 11 A.M. to 3 P.M.; syringe heavily in the afternoon, with rain-water, if possible; and after thus chilling the house, you may give a little air till dark, if the day has been hot, and you may expect the thermometer to be about 50° in the morning. I have pursued this plan with more than one new Conservatory at this stage, and I know of no way better.

Greenhouse.—After the middle or end of April gardeners begin to change the spring treatment for these plants; hitherto, every means have been taken to keep back early growths, and now that all the plants are in active growth, and the season so far advanced, that any necessary amount of air and moisture can be given in hot weather, the plants may be more encouraged to make a rapid growth, especially young plants. When the evenings are cold, the house should be shut up close, and air should not be given in the morning until the sun-heat warms it considerably.

Forcing-pit.—Where Cockscombs, Balsams, and other tender annuals are used, this is a good place to bring them forward through their early stages. Neriums ought now to have a gentle forcing. Camellias, to flower early, should also be forced, to form their buds, as well as the Chinese Azaleas which have done flowering. A few Crassula coccinea, now put into heat, will flower some weeks earlier. In short, where there is a good conservatory to be kept gay all the year round, and plenty of plants for the purpose, the forcing-pits need never be at rest, and may always be usefully employed.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

The weather is now so inviting, that it requires a strong resolution to resist the temptation to begin planting out the half-hardy plants in the flower-garden. I would, however, advise my friends to be particularly cautious on this head, as I am quite certain there is nothing gained by planting out before the middle of May, while there is every probability that between now and that time we may have some severe frosts. A friend of mine was tempted by the fine weather of last April to turn out his Calceolarias, and the consequence was he lost several hundreds of the plants, while those which survived were very materially injured, and did not bloom until late in the season. In another place nearly 5000 plants had to be reinstated, through being planted out too early; so that, though we can effect but little good, it is quite possible to do considerable injury. Keep the soil of the beds moved once or twice a week, and on strong soils a little short grass or half-decayed vegetable refuse will do no injury, if well mixed with the soil. I am trying experiments with a variety of the new manures: so far as I am at present able to judge, superphosphate of lime is the best, next to it Potter's guano, and then bone-dust. Nitrate of soda is good, but requires to be used with great caution. A small quantity frequently repeated is, I think, the safest method of using any of these manures.

Reserve Garden.—In answer to "G. O. F." the following may be regarded as a good selection of "moderately-tall" biennials and perennials: Alyssum saxatile, Amphicome arguta, Aquilegia formosa, glandulosa, grandiflora, sibirica, speciosa, arctica, and canadensis; Calliopsis Atkinsoni, Campanula carpatica, c. alba, persicifolia, pyramidalis, p. alba, Medium, alba, m. flore-pleno, Centaurea atropurpurea, Cynoglossum glochidatum, Delphinium azureum, chinense, c. album, elatum, grandiflorum, gratum, speciosum, Dianthus hispanicus, h. splendens, chinensis, plumarius, Digitalis new spotted, Echium grandiflorum, Iberis Tenoreana, Lupinus arboreus, elegans, grandiflorus, plumosus, polyphyllus, p. albus, Lychnis fulgens, chalcedonica, Œnothera macrocarpa, speciosa, taraxacifolia, Pentstemon campanulatum, gentianoides, coccineum, speciosum, Potentilla formosa, atrosanguinea, Mackayana, splendens, Hopwoodiana, Stachys speciosa, Stenactis speciosa, and Polemonium grandi-

florum. Most of these will bloom the season after sowing, but many of them, as the Campanulas, Delphiniums, Œnotheras, Pentstemons, &c., may be propagated with so much facility at the present time, if placed under a hand-glass on a warm border, that it is scarcely worth while to wait for seedling plants.

Pits and Frames.—Many of the annuals which were potted off early may now be planted out, and all plants for the Flower-garden must be hardened off preparatory to being planted out next month.

Chrysanthemums.—Where a large stock of dwarf plants is required for Flower-garden purposes in the autumn, the old stools or plants must be planted out in rich soil at about four feet apart, so as to leave room for their being layered in August. Old plants planted now at the foot of a wall in very rich soil, will cover a wall six or eight feet high by the autumn, and if properly trained will flower splendidly. I do not know any thing more interesting in the dull months of November and December than a well-covered wall of these fine plants.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Great care and attention must now be directed toward the Auricula, in order that the trusses may not be drawn up weakly. They should be able to stand erect without support, and "carry their heads" in a bold and graceful style. Continue to thin out all mis-shapen pips. The truss may consist, according to the strength of the plant, of from seven to fifteen, though in some parts of the country they are exhibited with three, which is decidedly too small a number.—*Polyanthuses*, in exposed dry situations, have suffered during the past hot weather; they require but little sun, and that early in the morning. Now is a good time for cross-breeding, by impregnation; and, though the operation is a delicate one, still it may easily be accomplished, and especially as pollen will keep (as we have lately read in the *Chronicle*) for some time between two pieces of glass, as surgeons preserve their vaccine matter for inoculation. With a camel-hair brush of the smallest size, remove the farina from the anthers of the variety wished to cross from, and apply it to the stigma of the one from which seed is desired, taking great care to have both sorts of the best possible form. The operation may be repeated, to ensure the proper fecundation; and it will be advisable to place a gauze cap over the bloom, to prevent the "burly visits" of the humble-bee, who in cases of this kind is often a "Marplot." Thousands of honey-bees fly over my Polyanthus-beds in the course of a day, yet I have not on any occasion seen them alight or work on them.—*Tulips.* As we may expect hail-storms, nets ought to be constantly over the advancing blooms. In the lace-making counties, the florist will often stretch a spoilt piece of "point net" over his bed, through which hail-stones cannot pass.—*Ranunculuses* are fast coming up. Riddle some leaf-soil or very rotten cow-manure over the beds; and, as the plants get fairly above ground, press the soil (on a dry day) closely round the neck of each.—*Pansies* are now making rapid growth; and, as they are often exhibited at spring Shows, they ought to be carefully shaded and attended to. The florist who intends winning, will visit his beds with candle and lantern, in order to detect "midnight marauders," in the shape of slugs, earwigs, &c. &c.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries—As many of the Pines will now be rapidly swelling their fruit, take care to support such as require it, as the shape of the fruit is sometimes spoiled by their being permitted to hang to one side. If more suckers appear than it is desirable to retain on the plants, their growth may be stopped by cutting out the hearts with the point of a sharp budding-knife, as recommended by Mr. Barnes to be done to the crowns when they show a tendency to become too large, taking care however not to perform the operation while there is any water standing on the leaves of the crown or sucker. Pot any of the successions that may require it, and replace them in their former situations in the bed. They can be properly arranged according to their height when the tan is renewed. Shade in hot sunshine any plants not well rooted. Give air freely to growing plants to keep them stocky. Much humidity during dull close weather draws the leaves up weak and slender, which must be guarded against by giving air, and keeping a drier atmosphere.

Vinery.—As this is the season for tying and regulating shoots, both in the Vineries of large establishments, and in the greenhouse of the amateur (for whose benefit this Calendar is principally intended); I may mention that it is a great point in Vine-culture to expose as large a surface of foliage to the action of light as possible. The bearing shoots should be trained nearly at right angles with the stem. Where the Vines are pruned on the spur system the strongest shoot on the spur should be preserved. The spurs should be at such a distance apart as will allow the leaves to expand without crowding each other. In thinning the "shows" regard must be had to the strength of the Vine.

Peach house—During dull close weather admit plenty of air and keep the house a little drier, that the young wood may be more vigorous, and the leaves have more substance than would be the case if grown rapidly in a close moist heat.

Fig-house.—Fig-trees in pots often fail to produce good crops when forced early; but by plunging the pots over the rim in tan or leaves mixed with chopped turf, and allowing the roots to run into it, supplying them plentifully with water, and keeping them clean, they may be made to produce a good second crop. During dull weather light a small fire to air the house where fruit is ripening, letting down the lights a little at the same time, to allow any superabundance of vapour to pass off.

Melons—It is often found necessary to grow several kinds of Melons in one pit, which occasions a difficulty in saving seeds true. No male blossoms should be suffered to expand except what are necessary to set the fruit. The fruit-blossoms should be set as soon as they expand, and immediately tied up with a piece of soft thread, to prevent the ingress of insects. This trouble need only be taken till a fruit or two is set of each kind of which it may be desirable to save seeds.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

If the present dry weather continues it will be advisable to water those trees against walls, which have a steep sloping border, as if the roots become too dry the blossoms will not set well. Previously to watering, fork over the border, repeating the operation at short intervals in warm days, until it become necessary either to mulch the border, or, in cold late situations, to cover part of it next the wall with tiles, for the purpose of causing more heat to be radiated against the trees, so as to forward the ripening of the fruit and young wood. Proceed with disbudding Peaches, &c., never losing sight of the fact that it is from your summer management, and not from any treatment you can give in winter or spring, that you can assure healthy fruitful trees.

Cucumbers, for ridges, *Vegetable Marrow, Gourds, &c.*—Sow seeds of these in a Cucumber-box, if you have plenty of convenience for forwarding them, if not defer sowing another fortnight or three weeks. Small healthy plants will succeed better than larger ones, stunted and half-starved.—*Beet, Scorzonera, Salsafy.*—Sow the main crops; sow again in the beginning of May, where such roots are in demand. Almost all seeds are coming up very thick this season.—*Routine.*—Keep the water-barrel and the Dutch hoe in motion, and dread the idea of being named "a sloven," by any one being able to point out a seed-weed.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Works previously recommended should still be done where they have not been completed. Prepare for felling and peeling Oaks and other trees, of which the bark is valuable, so that no time may be lost, when the bark separates freely from the wood.

Coppice.—When the cutting of saleable and useful produce is completed, it would be advantageous to go over the coppices and regulate the stools, cutting away all useless small spray, brambles, thorns, &c. Train the young rods, poles, &c. to one main stem. Shorten some of the side-branches, and take close off others that are very strong.

Young Plantations.—Fasten firmly recently planted trees that have been loosened by the wind and frost; hoe and keep down weeds in all young plantations. This should be attended to in time, before the weeds, &c., get "a-head," as it saves much labour, and prevents the young plants from being injured. Now is the best time to commence training Scotch, Spruce, and Larch Firs; break out the central leading bud of the longest lower side branches, and shorten the last year's growth of other branches of large size, particularly those of the Scotch Fir, when the branches are extending too far from the stem, and getting over strong, which prevents the stem from advancing in height and becoming of a regular thickness. This is necessary where Firs are wide apart, to keep the lower branches in due bounds. This method is far superior to taking off periodically the lower tiers of branches too soon. It is what Nature herself effects in close natural Pine forests.

Hedge Rows.—Proceed with what has been previously recommended under this head.

Nursery.—Attend carefully to the preserving of young plants as they appear in the newly sown beds, from birds, mice, &c.; shade, shelter, and water occasionally in dry weather the beds of Firs and small seeds. Large Nuts, Acorns, &c., do not require it. Water also in dry weather young plants that have been lately transplanted, and shade and shelter occasionally any tender or delicate kinds: hoeing and weeding should be particularly attended to at this season.—*W. B.*

State of the Weather near London for the week ending April 18, 1844, as observed at the Horticultural Garden, Chiswick.

April	Moon's Age.	Barometer. Max.	Barometer. Min.	Thermometer. Max.	Thermometer. Min.	Thermometer. Mean.	Wind.	Rain.

The highest temperature during the above period occurred on the 25th, 1840—therm. 80°; and the lowest on the 25th, 1827, and 26th, 1835—therm. 25°.

Notices to Correspondents.

ALTHÆA FRUTEX.—*R. I. M.*—This plant, which is also called Hibiscus Syriacus, may be propagated by layers.

ANEMONES.—*S.*—Rosalia, Reine d'Anemones, Rose Jolie, Triumphant, Rose Surpassant, Couleur de Sang, Rose Mernette, Olympia, Cour de France, Regina Rubrorum, Superbe Royale, Regina Augusta, Remarkable, Imperatrice, Rose parfait, Bellona Rose, Agreeable, High Admiral, Agnita, Reine Candale, Grand Duke, Belle Hortense, Incomparable Azure, Cramoisie Superbe, Reine des Fleurs.*

BEES.—*J. B. H.*—You had better begin your apiary with a strong new swarm, which ought to be removed as soon as the Bees settle in the hive; say the evening of the same day they have left the stock. In removing an old hive to the distance of eight miles it is apt to be injured, especially at this time of the year, when the cells are full of brood. The safest way to remove a common hive is to carry it by the tied ends of a cloth put round the hive. *J. W.*

BOOKS.—*J. N. C. H.*—There is no such book as you inquire for, nor is it likely that there will be. Books can only give hints and general directions. After all, a man must trust to the knowledge he gains by actual practice. Books with large plates are very costly to publish; and in these days they meet with little encouragement.——*Constant Reader.*—Books on Entomology, with coloured plates, are very expensive. Mr. Curtis's, which relates only to British genera, costs 30 or 40 guineas. You had better procure Kirby and Spence, or Westwood, on insects, or both. We never give prices; that is the business of the booksellers.——*S. B.*—Read Bevan on the "Honey-Bee."‡——*G. E.*—Is the book you want to be on the Theory or Practice of Horticulture? There has been no supplement to Loudon's "Encyclopædia of Gardening" since the last edition, which was published in 1835.‡

BROCCOLI.—*Falcon.*—The Walcheren Brocoli, or Cauliflower as it is sometimes called, is an excellent variety; and by sowing at different times it will produce heads throughout the greater part of the season, provided the winter is not too severe. Not without just cause, many complain of spurious seed having been sold instead of the genuine.‖

CEDARS OF LEBANON.—*A Lady.*—Why prune these fine trees at all? If you must, why, either autumn or winter may be taken.

CONIFERÆ.—*C. R. D.*—Pinus Hartwegii becomes a large tree. All such plants like a sandy peat to grow in; but they will succeed in any soil which is neither clay nor chalk. As to P. palustris, we should not anticipate any success from planting it. It might grow for a few years, but we fear it would die suddenly at last. Such, at least, is often its fate in situations much more favourable than one of clay on chalk, 560 ft. above the sea.

CROSSING.—*Subscriber.*—Cut out of one flower the anthers before they open, and then dust the stigma which is left with the pollen of another variety.

FRUIT-TREES.—*M.*—If your soil is well drained, all you can do with your fruit-trees which are beginning to canker is to remove them in autumn, concrete the bottom of the border, and replant them, taking care that the roots are spread out near the surface. All the cankered parts should be cut clean out, and the wounds covered with clay.‡——*J. K.*—You will do well by thinning greatly the excessive quantity of blossom on your Pear trees.‖——*H.*—You can only plant with advantage, against a wall which faces the north-east, Morello Cherries and Currants, with some of the hardiest Plums and Apples. It is too late for this season.‡

FUCHSIAS.—*P. Lawson.*—You may plant out these in the open border about the middle of May, when there will be little danger of their being injured by frost. Allow your seedlings to grow without topping the first year. The second year they may be treated in the usual way. Plants damp off from being kept without air.‡

GRAPES.—*K. R. F.*—Your deformed Grapes are curiosities in their way. What has happened is that the growth of the berries has been arrested, but that of the seeds has gone on. The latter have in consequence burst through the sides of the berries—have become green, and now resemble green Peas. We wish you would allow a bunch to hang in order to ascertain *whether*, under these curious circumstances, *the seeds* will ripen. The mischief has no doubt been produced by a cold current of air acting on the surface of the bunch and arresting its formation. It is a pity, because the bunches are good ones.

INSECTS.—*Z.* is referred to our columns this day for the history of the Pansy-fly, and we shall feel obliged by the transmission of the insects which may be suspected of injuring the Pansies in any way. *R.*——*W. H. H.*—Your mixture for the trunks is very good, and if the eggs of the insects be deposited on the bark it will destroy them if well brushed in; but to derive any benefit from washing the trunks, it must be done without farther delay, and it may be repeated in a week; the same operation should also be performed in the autumn. It is the want of perseverance which renders so many remedies ineffectual. *R.*——*A Sea-side Gardener.*—Trombidium holosericeum; we never heard of its doing any mischief. How does this Acarus injure your Carnations? *R*——*E. M. T. E.*—The insect supposed to be hurtful to sheep is the larva of a beetle, and probably of the Staphylinus olens, Linn. It is exceedingly useful in destroying injurious worms in gardens and fields. *R.*——*John a Gardener.*—We have had no opportunity of ascertaining the effect of guano upon slugs and snails, and hope you will try the experiment with some pulverised, and report its effects. Without seeing a specimen or a drawing of the black slug we cannot determine the species, but it is to be presumed that it is by no means useful in a garden. *R.*——*J. H.*—The snail eating the roots of the Pines, and breeding on Cucumber beds we believe to be an English species, but cannot tell you the name at present. *R.*——*S. Webb.*—The weevil destroying your Peas appears to be the Curculio tibialis; we will shortly figure and describe the species, and endeavour to suggest some remedy. *R.*——*J. N.*—Your insects are the same as the last. *R.*——*Isle of Wight*—Your beetle is the Curculio lineatus, as well as we can make out from the crushed specimen. Strewing soot or lime along the rows is the best remedy. Please in future to inclose more than one example in a quill well stopped.—*R.*

LICHENS ON FRUIT-TREES.—*Majorca.*—It is impossible to prevent the growth of these plants by scraping the branches. The Danaids themselves would lose their patience in the attempt. Lay the ground dry by draining, cause air to circulate freely among the branches, and the scraper will not be wanted.

MOSS IN LAWNS.—*C. M. I.*—As it is the ammonia in gas-water that kills Moss, it is probable that a solution of sulphate of ammonia, say 1 lb. in two gallons of water, would produce the same effect. It *must* be pretty strong. Your Grass will be scorched, but it will soon recover.

NAMES OF PLANTS.—*L. M. S.*—Euphorbia Charasias? and a form of Vicia sylvatica? but what specimens! Mr. Douglas was killed by a wild bull, in a pitfall used for trapping wild cattle in the Sandwich islands.——*M.*—Epidendrum phœniceum.——*Derwent.*—Apparently Gardenia campanulata.——*Annandale.*—Kennedya rubicunda.——*K.*—Indigofera australis, Gorteria rigens.——*Gramen.*—Phalaris arundinacea.——*Ignoramus.*—Cunninghamia sinensis.——*M.*—Erysimum Peroffskianum.

ONIONS.—*A Subscriber.*—There is no better plan of fastening these in very light soil than that of rolling the beds. We have seen beds rolled quite firm, even after the plants were 6 or 7 inches above ground. The Onions afterwards grew away quite strong, and were not injured by the rolling.‡

ORANGE-TREES.—*J. A.*—If you syringe or over-steam any plants when in flower, they will not set their fruit. We explained the reason in a leading article two or three years ago. If your Orange-trees are kept in warm soil and a warm sunny atmosphere, their fruit ought to set freely. You will probably find that an account of some Orange-houses, which we shall publish to-day, will supply you with information as to the best way of getting bottom-heat. If not, inquire again. If tan is used, you must take care that the roots do not come into contact with it. The ground temperature of 70° is high enough for Oranges.

RABBITS.—If the person complaining of rabbits will write to C. A. A. Lloyd, Whittington, Oswestry, he will send him a plan for their total destruction.

ROSES.—*H. F. I.*—The following will answer your purpose, viz.: Amie Vibert, Noisette, corymbiflora, Juan Desprez, Triomphe de Plantier, Madame Desprez, Bourbon, and Phœnix.‡

VEGETABLE RESPIRATION.—*Ignoramus* says it is well known that the leaves of plants are very powerful agents in purifying the air for us, by imbibing carbonic acid and exhaling oxygen; and yet the winter season, in which there are comparatively no leaves, is proverbially more healthy than the summer; and he asks us how that is? The reason is obvious. During the cold months of winter the decay of animal and other matter goes on very slowly; consequently the air is less deteriorated, and therefore, if there are fewer plants to purify the air, there is also much less need of their presence.

WHITNEY'S COMPOSITION.—*A Lady.*—This is applied warm, with a painter's brush. The person who sold it you should have furnished printed directions. Would it not be better to apply to him for them?

MISCELLANEOUS.—*Querist.*—We presume that your Pears were never ripe, or they must have been some very bad sort. For Strawberries and Asparagus, use guano, mixed with water, in the proportion of a double handful to 4 gallons, stirring it well, and leaving it all night. Apply it when they are beginning to grow. The only rule in thinning plantations, is to take care that every plant can grow without touching its neighbour, and to preserve the handsomest plants. It is for you to judge what should be left; that depends on your ultimate objects. If you want scaffold-poles, why then, the Larches must not be thinned so much.——*A Subscriber.*—Much obliged, but No. 33 has been sent; the other Numbers we do not require.——*Falcon.*—We will bear your request in mind.——*A. G.*—All your seeds must be raised in bottom-heat, and will then require a stove, with the exception of 11, 15, 21, 24, which may be grown in a greenhouse. The only plants which will be handsome are 23, 29, 31, 35, 49, 52, 55, 65, 70; but many of them will be difficult to flower.——*E. M. S.*—All the Indian seeds in your list require the damp stove, when they may be treated like other plants in the same situation. They are not much worth having, except Convolvulus umbellatus.——*Dilemma* will find a select list of evergreen shrubs given at p. 757, 1843. For plants for bedding out, see p. 40 of this year.‡——*J. M.* is answered at p. 196, 1844.‡——*T. C.*—We are unable to state farther particulars respecting the slate wall than what are mentioned in the report of the Horticultural Society of April 2d.‡——*Bath.*—Address, the Secretary, 20, Bedford-street, Covent Garden.‡——*A Subscriber from Andover* should explain his meaning; we do not know to what he alludes.——*T. P., Midhurst.*—We do not know. We printed the report as we received it.——*Amateur.*—We really cannot spare the time; personally, with pleasure, but not otherwise.

SEEDLING FLORISTS' FLOWERS.

CAMELLIAS.—*A Subscriber.*—We should like to have seen your bloom in a fresher state; the colour is good, and the flower well filled up. It is too much like some that we have, we recommend you to keep it.*

CINERARIAS.—*R. N. L.*—Your seedling is one of the largest we have seen, and good in colour; the fault in the flower is in the petals being so long for their substance that it does not retain a compact form.*——*R. and S.*—Both your seedlings are well-formed flowers, and they appear to be free bloomers. No. 1 is the best, but both of them are weak, and common in colour.*

PANSIES.—*Y. and Co.*—Lady Alice Peel is a large, showy, well-formed flower, of considerable substance; the eye good, and the belting, though rather broken, is uniform. There is a slight roughness on the edges of the lower petals, and also a dash of yellow in the lip, which injures the uniformity of the ground-colour.*——*J. R.*—No. 1 is a seedling of very fine properties; its only fault is that it is too small; the other specimens are border varieties only.*

POLYANTHUS.—*J. R.*—Your seedlings are very poor indeed.*

*** As usual, many communications have been received too late.

ERRATUM.—In last week's Number, in the article "Cultivation of Grapes in Pots," p. 229, line 4 from the end, for "Mr. Tillans," *read* "Mr. Pillans."

A RESPECTABLE YOUNG PERSON is willing to bind himself for three years to any respectable Farmer who would consider himself repaid for the board and lodging afforded throughout the term, and for the Agricultural Instruction afforded during the first half of it, by the assistance of the Advertiser during the remainder. The Advertiser is already possessed of considerable knowledge of Agricultural practice, such as is derivable from books, and is anxious to fit himself for the situation of responsible Manager of a Farm or Estate.—Apply to A. B., at the *Gardeners' Chronicle and Agricultural Gazette* Office.

The Agricultural Gazette.

We have to direct the attention of our readers to the valuable paper in another page by Dr. Smith, of Manchester. It is unnecessary here to refer in detail to the various tables there given in illustration of the composition of Agricultural plants, but there are one or two points connected with them to which we may advert. Dr. Daubeny, in his Lecture to the English Agricultural Society, some years ago, spoke of a system of scientific book-keeping capable of adoption by farmers in manuring their land. The principle of it lay in this: that with each crop, whether of Corn, Roots, or Grass, grown upon and carried off the land, a certain quantity of various substances was removed from the soil. If all those crops were consumed on the land, the greater part of these ingredients would be returned to it in the manure derived from their consumption; and it would be long before the loss of the small portions, amounting, perhaps, to a 150th part of the whole, which go to market in the shape of beef, mutton, bacon, &c., would have any defertilising influence. But in many cases, Hay and Roots, as well as Wheat, Oats, Barley, &c., are sold off the farm, which would thus soon be run out, were we unable to return to it in other forms—those of farmyard manure, and various other fertilisers—the materials of which these crops consist. A perfect balance, in which no waste on either side occurs, can only take place when the exact amount of all the ingredients of the produce removed from the farm is thus returned to it in other shapes.

Now, before we can adopt this perfection of cultivation, so far as the application of manures is concerned, i. *e.*, before we can adopt Professor Daubeny's suggestion, and balance the debtor and creditor sides of our manure and crop account in his system of scientific bookkeeping, we require a knowledge, first, of the composition of all Agricultural plants; and secondly, of the composition of all known manures. All the evidence* existing on the first of these subjects is given in a tabulated form in another page by Dr. Smith. By means of these tables, we can ascertain, within the limits between which plants vary in their composition, the amount of all the substances removed from the soil by a given weight of any crop grown by the farmer: and it only requires a perfect knowledge of the second of these subjects—a knowledge of the composition of manures—to enable us accurately to supply the losses which the soil thus sustains. A table of analyses might be compiled of these, and we may perhaps hereafter be able to present one; but a consideration of the daring extent to which their adulteration is carried, and of which most of them are susceptible, must convince any one that such a table would be of little value compared with the system recommended for adoption by W. H. Hyett, Esq., in his article on "The Fertilisers of Commerce," (page 218). Meansgenerally at hand, such as, with Mr. Gyde's assistance, he proposes to establish in Gloucestershire—means, at the farmer's command, for obtaining cheap and punctual analyses of manures before purchasing them, would be of the greatest use, not merely to a scientific farmer, who would thus be enabled to adopt Professor Daubeny's system of scientific bookkeeping, but more especially to the practical and economical tenant-farmer, who would thus be saved all risk of the losses, to which, as Mr. Hyett has clearly shown, he is at present exposed.

Besides the mineral ingredients of plants, allusion is made in Dr. Smith's tables to their organic constituents also; and we refer to this now, in answer to several correspondents who have applied to us upon the subject. The gluten, the most nourishing part of vegetable food, upon which, therefore, the quality of a crop in a great measure depends, requires for its formation the presence of nitrogen in the food of plants. Liebig has shown that nitrogen is useful to a plant only when presented to it in combination with other substances, as in the form of ammonia, and its salts; and he has also shown that a supply of ammonia exists in the air. It is not necessary, as some of our correspondents appear to suppose, to assume that this ammonia is absorbable only by the leaves of plants; the probability is, that it is mostly taken up by their roots, being brought to the ground in rain-water. To the practical Agriculturist, however, speculations as to the offices of the several parts of plants are of *comparatively* small importance; whenever we have ascertained by actual experience the effect of certain manures, the mode of their action is nearly immaterial. We *know* that salts of ammonia, the sulphate (essence of soot), muriate, phosphate, &c., do possess, under certain circumstances, extraordinary fertilising influence. These circumstances are, the non-existence of them already in the soil, and the absence of anything there, such as caustic lime, which would volatilise them, or otherwise spoil their efficiency. If we know the state of our soil with regard to these circumstances, then, knowing the value of these manures, we have sufficient to guide us in their application, independently of any theories as to the mode of their action.

But ammonia is obtained from other sources than these; it is evolved during the decomposition of animal matter, and it is therefore impossible reasonably to suppose that the animal matter of fresh bones, which is a source of it, can be useless. Some experiments have apparently shown that the simple phosphate of lime is superior as a manure to bones which contain a good deal of animal matter; but Experience is a safe guide to follow only when we are able to read aright what she tells us, and when we know the circumstances under which an appeal has been made to her. In a soil already sufficiently supplied from other sources with ammoniacal salts, the simple phosphate of lime, which is a necessary element in the food of plants, whether it be obtained by boiling bones or burning them, might be equally efficacious as a manure with the unboiled bones full of animal matter; but the result would be reversed, and with perfect consistency too, in the case of another experiment in which the boiled and unboiled bones were tried on a soil deficient in organic matter, and therefore likely to be benefited by the application of animal manure.

In the remarks annexed to these tables, Dr. Smith has very satisfactorily explained how the experience of a farmer, when read aright, may inform him as correctly of the wants of his soil as the chemist could, though assisted by sensitive tests and accurate balances.

* Since Dr. Smith wrote his paper, Mr. Solly's valuable Report of "Experiments on the Inorganic Constituents of Plants" has been published by the Horticultural Society.

GEOLOGY AND AGRICULTURE.

(*Continued from page* 234.)

The connexion, which the Geologist had observed, of certain plants with certain formations, was explained, for he knew the constituents of the rocks from which the soils in which they grew were derived, and he saw that those substances abounded in the ashes of the plants which flourished on them. From his knowledge of the chemical composition of a given variety of rock, which its external characters often indicated to his experienced eye, he was enabled to give a much better estimate of the proportion of substances essential to vegetable life which would be found in a soil derived from its disintegration, than could be obtained from the analyses of soils made by eminent chemists of the old school, who confined their investigations to the amount of silica, alumina, lime, and humus. A soil, for instance, derived from the detritus of granite abounding in feldspar he will expect to be friable, from the large quantity of silica present in all granites, and to be rendered fertile by the presence of a fair proportion of alumina and potash. In the detritus of a rock containing hornblende as well as feldspar, he knows that there will be an increase in the proportion of the fertilising ingredients, potash, magnesia, and oxide of iron.

Geology is said, again, to be useful to Agriculture, by leading to a more systematic classification of soils. Of this there is great need, for the Agricultural nomenclature with regard to soils and mineral manures, is lamentably defective. From this cause arises much of the contradictory results we hear of, from experiments with the saline and mineral manures. The farmer of West Norfolk tells you that he improves his light sandy soil by claying it; the farmer of East Norfolk produces the same results, on the same soil, by the use of marl. In each case the substance applied is nothing more than chalk detritus, mixed sometimes with a little clay; sometimes it is the solid chalk itself. In Scotland marl consists of masses of fresh-water shells, accumulated in the beds of ancient lakes. In Cheshire it is the red marl of the new red series, which contains much peroxide of iron, and is often gypseous and saliferous. In Cornwall, disintegrated hornblende rock is applied to the land, under the name of "marl." In Germany the marls used for the improvement of soils contain much magnesia. In describing such mineral manures, greater precision will be attained by stating from what group of rocks they are derived, and by adding to the usual names of soils, that of the geological formation to which they belong; stating, for instance, whether our sands are those of the new red series, the plastic clay, the green sand, or the crag; and whether our clays belong to the new red series, the coal measures, or the lias. But the value of such a geological classification of soils depends upon the chemical information conveyed by it. The composition of a given rock being known, that of the soil derived from it may be approximately inferred.

There are modifying circumstances which will disturb conclusions as to the fertility or sterility of a soil, drawn from the nature of the rock on which it rests. These arise from the effects of the transporting power of water during the existing geological epoch, or that which immediately preceded it. In the first place, there are alluvial deposits—some of them now in the act of formation—composed of the fine earthy matter brought down by rivers in a state of suspension, and deposited in estuaries and sheltered bays, where there is still water. Such deposits contain, in a state of fine division—a circumstance in itself highly conducive to fertility—particles derived from all the formations drained by the river and its tributaries. From the variety of ingredients contained in them, they are invariably productive. There are, however, degrees of fertility among them dependent on the geological structure of the whole district through which the rivers depositing them have flowed, by which, more than by the nature of the adjoining rocks, their chemical characters are affected. 2dly, there is that more generally distributed detrital deposit, long called diluvium, and now known by the names of northern drift, moraine, and boulder formation, which appears to have been formed during a geological epoch immediately preceding that in which we live, partly by the trituration of ice, partly by the transporting power of water. This deposit consists principally of detritus derived from the subjacent or neighbouring rocks, mixed, however, with much that has been transported from distances of several hundred miles, which may be traced with precision to its parent rocks. It is of very variable depth, frequently covering the rocks with only a thin film, and within very short distances attaining a depth of several hundred feet, composed of clay, sand, loam, coarse gravel, and boulders—the clay usually in the lower part. The clay, particularly where calcareous detritus is mixed with it, affords the means of improving the sandy portions which generally constitute the surface. A large portion of the county of Norfolk is covered with this deposit, furnishing soils varying in value in their natural state from 3*s.* to 40*s.* the acre. The district of Holderness, in Yorkshire, likewise consists of it; and it occupies extensive areas on the skirts of all the principal mountain chains and hills of these islands. It is obvious that such a deposit must not only modify the characters which the soil would derive from the detritus of the subjacent rocks, but must often completely make them. In some cases, as in Wales, it covers hard and barren rocks with a deep soil, either fertile in itself, or capable of being rendered fertile; in others, it has overwhelmed rich tracts of red marl with coarse gravel and boulders. In any geological classification of soils, therefore, we must not only note on what formation they rest, but whether they are alluvial, or belong to this northern drift, diluvium, moraine, or whatever name we choose to adopt out of its numerous synonymes. The altered character impressed upon sedimentary strata in the vicinity of igneous rocks is another circumstance which must greatly modify conclusions derived from the position which they hold in the series of deposits. The mere induration thus produced must materially influence the character of the soil derived from them. A well-burnt tile will not fall to pieces after a shower, like sun-dried clay; and ground tiles would produce a soil very different from the clay of which they were formed.—*J. Trimmer.*

WOODEN SHOES.

BY MARTIN DOYLE.

(*Continued from page* 235.)

The wages of French labourers, male and female, may be stated generally as the same in amount with those paid in Ireland, and therefore the people of each country may be said to have the same limited funds for the purchase of shoes. Yet, while the poor Irishman and his wife and children are in continual discomforts in this particular, the meanest beggar in France, from the infant to the grandsire, has the feet perfectly dry and warm. The wind is blowing keenly from the north-east; the Frenchwoman has her window open; she sits spinning away merrily in a temperature in which one of my countrywomen would be codling over the fire, or tramping to the bog for baskets of turf. The French children under the same circumstances are playing about indifferent to the cold; the Irish children are cowering with the dog and cat over the ashes on the hearth, and shrugging up their shoulders to their ears in the attitude of misery; and why this difference?—because the French have their feet dry and warm in their wooden shoes, and the toes of the others are cold and wet, and therefore causative of chilliness the whole day.

I have seen an old Norman woman of 80 sitting at her fruit-stall in the streets during frost and snow, when the thermometer stood at 15°, and apparently very comfortable, because with good woollen clothing, her feet were in wooden shoes, resting on a little pan containing no more charcoal than would roast a tom-tit. I have remarked hundreds of delicate-looking females sitting in their shops, plying their needles with the doors open, in the severest weather, with no other covering on their heads than a muslin cap, and without a cloak, while I was muffled up in a heavy coat, and yet trembling with cold. They did not feel it because they had their feet cosily covered up in wooden shoes, and had a dish on the counter to warm their fingers now and then, or to supply heat to the lower extremities at intervals. Wooden shoes, with the lower orders in France, are a substitute for the warmth of fuel, which is terribly dear in most parts of that country; and this consideration should with our philanthropists be

a very influential motive for dispensing sabots through the length and breadth of Ireland.

The sufferings of thousands of our poor in winter, in various localities, from the combined want of fuel and covering for the feet, are horrifying. Of these two deficiencies, one is directly remediable by the use of wooden shoes. They cost from 3*d.* to 10*d.* a pair, exclusively of the leather strap, which is drawn across the instep, and nailed at each side near the bottom. A working-man will wear out in the year from two to three pair; and his sabots are usually made not to require any straps, though the sabots of the females are generally furnished with them. He must have two pair of strong well-knitted worsted stockings at 1*s.* 3*d.* a pair; and this cheap supply is sufficient for those farm-labourers who have not occasion to walk much upon the roads. From early and constant familiarity with the sabot, the French do not find them impediments to motion; and, in summer, wear them without stockings, from early habit, without any unpleasant sensation to their feet.

But to be comfortable in winter, every one who can afford the indulgence has list slippers, which, besides imparting warmth, prevent even the tenderest feet from feeling any inconvenience from the sabot: it keeps them so firmly fixed in it at the heel, which would otherwise often slip out, that a person, when a little accustomed to sabots, can walk rapidly, or run in them,—children dance in them. These shoes are bought in France for about half-a-crown a pair. I think they would cost in Ireland (or Scotland) little more than half this, on account of the much greater cheapness of our woollens. The whole average annual expense, including leather shoes for three months in the summer, to the French labourer or farmer's boy for preserving his feet, may be estimated at 10*s.* His wife and children are rendered really comfortable in the same respect the year round, and without any interruptions, for a far lower sum.

To women, they answer all the purposes of the English patten, with the advantage of much greater warmth. In wet and sloppy weather, they may be instantaneously taken off on entering the house, and are slipped on again in a moment on going out.

Women break stones for the road very frequently in France, and do much of the labour which with us is performed exclusively by men; wooden shoes to persons standing or sitting all day on wet soil are invaluable.

(To be continued).

ON THE INORGANIC AND OTHER CONSTITUENTS OF VARIOUS AGRICULTURAL PLANTS.

BY R. SMITH, ESQ., PH. D., ROYAL INSTITUTION, MANCHESTER.

Remarks in Connection with these Tables. — The following Tables contain all that we at present know, with any degree of certainty, of the organic and inorganic ingredients in field and garden crops, and they will, we believe, be found of great service to the farmer, as data either for calculating the value of any quantity of food, for choosing manure, or for determining on the crops to be cultivated, provided it is combined with a knowledge of the soil and the constituents of various manures. We have given first the results of Professor Sprengel, as arranged by Professor Daubeny, being fuller than those of any other analyst; and although, in several instances, they differ from those of other chemists, the great difficulty attending such an inquiry has hitherto deterred any one from pursuing it further than he has done.

We have in Tables II. and III. given the analyses of several substances by others—Table II. being by Dr. Playfair, and Table III. made in the laboratory of Liebig; which being done later, and under greater advantages from the progress of chemical knowledge, may probably be preferred by many as data for calculation. We will first direct attention to Table I. and its uses.

TABLE I.—SHOWING THE CONSTITUENTS OF FIELD AND GARDEN CROPS.—Arranged from the Analyses of Sprengel and Boussingault, by Prof. DAUBENY.

The quantity of gluten is here given, and the amount of inorganic or mineral ingredients in 100,000 lbs. of each crop. By looking at column 3d, we see that the quantity of mineral constituents differs very much in various plants, *i. e.*, that plants vary much in their power of absorbing matter from a soil; and again, that the quantity of each individual constituent varies much. The seed of Wheat requires 400 of silica, the Straw 2870, whilst Potatoes require only 8, for 100,000 lbs. It will be seen that the Straw of corn requires a large proportion of silica; it is necessary, therefore, that this should be supplied in the soil. Although silica is the chief ingredient in every soil, it does not follow that every soil can give to the plants a sufficient supply, as they cannot absorb it unless presented to them in the form of silicate of potash, or at least in a disintegrated form, and not as hard gravel or sand. The question might now be asked, How are we to know when there is sufficient silicate of potash in the soil of any field on which we wish to sow? It would be impossible for farmers to have every variety of soil analysed, which in a large farm they are obliged to deal with, and we would suggest the possibility of obtaining a correct knowledge of a soil and its ingredients by a mere consideration of what crops have previously grown well upon it, and what have failed. Suppose the Wheat Straw has been bad, has been stunted in its growth, both in a wet and dry season, we have good reason to suppose that the supply of silicate of potash has been deficient, and in manuring for future crops, we must choose some substance which will supply this deficiency. We must choose one rich in silicates, or allow the land to remain without removing from it a crop of corn, until the silicates contained in the soil have become soluble. Supposing we choose the latter course, we might either allow it to remain fallow, or take from it some crop which would diminish in a very small degree the amount of silica. Potatoes seem the lowest in this column; they require, however, a considerable quantity of potash and soda; so that a manure containing these is next required. Supposing, again, the produce in grain has been small, the effect has probably been owing to the want of phosphoric acid, magnesia, and the alkalies, which by the Table will be seen to compose a great part of the constituents of the ear of Wheat, as well as of every other nutritious substance. In this case a manure containing phosphoric acid, magnesia, and potash, is to be sought for. The same reasoning may be applied to Beans, Peas, &c., and the experienced farmer will probably see various applications of it. As the gluten requires the phosphates of magnesia, lime, potash, and soda, we cannot expect any part of a plant rich in nutritious matter to grow without a supply of those substances. In every case, therefore, in which a crop containing much gluten is to be reaped, there is the greatest necessity for attending to these salts, as they are more frequently wanting in a soil than any of the others, soluble silicate of potash excepted. A deficient crop of Peas or Beans might be caused by this circumstance alone. But in this case both the Straw and the seed would be deficient, as we see from the Table that both require a considerable supply of phosphates. As it is not our object here to treat of the rotation of crops, but merely to give some explanation of these Tables, and to show their practical use, we shall leave the details for the present. Correct analyses of various manures would be of great importance to the farmer, in giving him the power of choosing one which would supply that ingredient in which he considers his land deficient.

The quantity of gluten and inorganic ingredients subtracted from 100,000 leave the quantity of starch, water, &c., in Wheat and other grain; but as the nature of this remaining portion has not been so minutely examined, the information on this subject has not been tabulated.

Table II. gives the per centage of water, unazotised matter, &c. according to Dr. Playfair. The unazotised matter in grain is chiefly starch, and it varies inversely as the amount of gluten in Wheat varies. Wheat, in favourable circumstances, especially from warm countries, contains as much as 33 per cent. of gluten; in this case the per centage of starch is less than when the gluten amounts to 14 only. If abundance of phosphates are supplied to the soil, for example, in the form of human urine, Wheat has been found to contain 35 per cent. of gluten; if a small supply of phosphates has been present, less than 12 per cent. has been the produce. We have very little distinct information on the nature of the substances in col. 3; it must, however, be remembered that the great object of a farmer is to obtain in his crops a large proportion of gluten (col. 2), this being the principal nutritious substance.

The quantity of Starch has been estimated as follows:—

Wheat	56·72	per Cent.	Vauquelin.
Usually	71	"	
Oatmeal	59	"	Vogel.
Ryemeal	61	"	Einhof.
Barleymeal	66 (about)	"	
Rice	85	"	Braconnot,
Peas	32	"	Einhof.
Beans	35	"	
Potatoes	15	"	Einhof and others.

The constituents given in Table II. agree very closely with those given by Sprengel, especially in the amount of gluten.

TABLE II.—Showing the proportion of the organic and inorganic constituents of certain plants, by Dr. Lyon Playfair.

100 lbs. contain of	Water	Albumen	Non-azotised matter	Total Organic matter	Ashes
Peas	16	29	51½	80½	3½
Beans	14	31	51½	82½	3½
Lentils	16	33	48	81	3
Oats	18	11	68	79	3
Oatmeal	9			89	2
Barley meal	15½	14	68½	82½	2
Hay	16	8	68½	76½	7½
Wheat Straw	18		76½	79	3
Turnips	89	1	9	10	1
Swedish Turnips	85			14	1
Mangold Wurtzel	89			10	1
White Carrot	87	2	10	12	1
Potatoes	72	2		27	1
Red Beet	89	1½	8½	10	1
Linseed Cake	17			75½	7½

Table III. is a collection of analyses by various chemists. Here we have a composition different from that given by Sprengel, a larger quantity of phosphoric acid, an absence of silica from the grain of Wheat, and a large proportion of it in the Straw. There is, however, no necessity for any hesitation in using the Tables on account of this discrepancy, as from each of them we may draw the conclusion, that to obtain a good crop of Wheat, *i. e.* both ear and straw, the presence of phosphates and silicates is indispensable. We may, however, add that as these analyses have been done very lately, and with great care, they are probably the most accurate we have; it is only to be regretted that there are too few from which to form a Table similar to that of Sprengel. The analysts have not given here the per centage of ashes which they found; this is, however, an unimportant point, as they vary sometimes several per cent., the proportion of each ingredient remaining the same, according to Liebig.

TABLE III.—ANALYSES OF 100 PARTS OF THE ASHES

| | | | | | | | | | | | |

TABLE IV.—Showing the amount of Gluten in the following substances, their comparative value as food, and the prices of 100 lbs. of azotised nutriment in each.

	Weight of each substance containing 100 lbs. of Gluten.	Amount of Gluten per acre—	Price of 100 lbs. of Gluten in each substance.	Estimated value to the Farmer—the data of these calculations.
	lbs.	lbs.		
Wheat	677	212·7	3l. 18s. 11½d.	7s. per 60 lbs.
Do. Straw	5376	45·8	5l. 11s. 8d.	2s. 6d. .. cwt.
Barley	798	199·2	3l. 0s. 2½d.	4s. .. 53 lbs.
Do. Straw	6203	27·	4l. 3s. 0¾d.	1s. 6d. .. cwt.
Oats	726	220·3	2l. 8s. 4¾d.	2s. 8d. .. 40 lbs.
Do. Straw	4480	50.	4l. 0s. 0d.	2s. .. cwt.
Maize	806			
Potatoes	4359	513·	2l. 14s. 5¾d.	28s. .. ton.
Beans	314	458·5	1l. 6s. 2d.	5s. .. 60 lbs.
Peas	396		1l. 13s. 0d.	
Lucerne, dry	973			
Do. fresh	5376			
Red Clover, dry	582	481·	16s. 7d.	60s. .. ton.

ON THE CULTIVATION OF FLAX.—No. III.

THE next process in the cultivation of Flax is weeding, which is one requiring much care and attention, although the previous preparation of the land for the crop should have been so conducted as to have left few root-weeds in the soil. Annual weeds will, however, spring up among the crop, and these also must be removed. This is usually done when the plants are a few inches in height, and can be readily distinguished from the weeds, which will be between the third and fifth weeks after sowing. It is performed by women and children, who, with coarse cloths around their knees, creep on all-fours, which injures the young plants less than walking on them, and enables them more readily to distinguish the weeds. They work also facing the wind, so that the plants laid flat by their pressure upon them, are thus at once blown up again, or at least assisted to regain their erect position. This precaution may appear unimportant, though it is invariably practised by the Continental farmers, and shows, in a striking manner, the minute attention which they pay to every process connected with the culture of the plant.

When, from any cause, it is wished to lay down the land to Grass, on which Flax has been grown, the preparation of the land for the Flax renders it a favourable opportunity to sow the Clovers and Grasses; and this is a common course of cropping in districts in which that crop is grown. In this case the seeds of the forage and herbage plants are either sown with the Flax-seeds, or just before the weeding of the crop; the treading of the weeders, and pulling up the weeds, in the latter case, affording the necessary covering. Flax, however, is too close a growing crop to admit of the Clovers and Grasses being grown among it, without interfering with their growth; nor does the admixture take place without injury to the Flax-crop itself; still it is supposed that what is thus lost on the one hand, is gained on the other. The Flax-crop is but a short time on the land, being pulled while vegetation is still active; and the pulling of the crop loosens the soil, and causes the Clovers and Grasses to push forward afterwards with increased vigour. But this early pulling of the Flax also admits of the other seeds being sown afterwards, when a slight harrowing only is required, to prepare the land for their reception; and this, indeed, seems the preferable practice, though the former is that most frequently adopted.

These, then, are the principal details connected with the cultivation of Flax which should come within the province of the farmer to perform. So far, no difficulties have presented themselves in the way, and no departure from the ordinary operations of husbandry has been required; but the after management involves a degree of minute attention to details which the other labours of the farm rarely admit of being devoted to it. Flax has not hitherto been cultivated to any great extent in this country, and however great the returns from it may be, so long as the preparation of the crop for market devolves on the grower of it, the quality will be inferior and the crop unremunerating. Even in those districts on the Continent where its cultivation is best understood, the grower does not prepare it for market, but very wisely leaves that department to a class of persons who devote themselves solely to that business. These Flax-factors, therefore purchase the crops while growing, paying the farmer at the time, so that he is relieved from all further trouble with it. From the superior management which continued practice enables this class of persons to adopt, they can afford to give the farmer even a better price for his crop, while growing, than he would probably obtain after preparing it for market himself; and the advantage of having the return from his crops in less than three months after sowing it is, of itself, too important to be overlooked. It is to this system of management that the superior quality of the Continental Flax is chiefly to be attributed, and before Flax can be grown advantageously in this country, a similar practice must be introduced. The state of Flax culture in Ireland affords a striking illustration of the truth of this remark. The crop has been cultivated there almost from time immemorial, and a public Board has been in existence in that country for upwards of a century, enjoying a Parliamentary grant of over 20,000*l.* per annum, exclusively devoted to the encouragement of the linen manufacture; but notwithstanding all this, the preparation of the crop for market was conducted in such a very inferior manner, and the prices thence obtained so low, that the growth of the crop, a few years ago, was all but given up altogether. The fact is, ordinary farm labourers can never be expected to conduct this work in a proper manner, it being so different from any other part of their labours. Not, indeed, that the operations connected with it are in themselves difficult of execution, or not easily understood; but to insure success, and produce fibre of good quality, the peculiar manner of performing them, and the precise time at which they should take place, require such a degree of experience as long and continued practice alone can give. The watering, for example, is a very simple process, yet the water itself may contain matters incompatible with the production of Flax of a superior quality; and a short time either too long or too short in the steep will prove equally, if not more injurious. The grassing, too, is an exceedingly simple operation, the intention in this case being to remedy any defects in the watering, and to get any impurities which may be carried from the ponds washed off by the rains; and further to improve the colour of the whole by exposing it to the sun, or, to use the familiar phrase, to get it bleached. Yet, simple as is the latter process, and indispensable as it must appear on the slightest reflection, it is not a little singular, that until the Belfast Flax Improvement Society directed attention to the subject, its proper performance in Ireland was to be regarded as the exception—not the rule—notwithstanding the degree of attention which Flax culture has for such a lengthened period attracted there. The Irish Flax was uniformly characterised by its want of uniformity both in colour and texture, circumstances which are attributable to defects in grassing.

These observations are made not so much with a view of preventing the more general culture of Flax in this country, as to guard the cultivator against failure in making the attempt. Flax is, beyond question, either a very profitable, or a very unprofitable crop, according to the course of proceeding adopted. It is, no doubt, often found unremunerating, when the different items of expense are taken into account, but in such cases it may be presumed that the management has been defective, seeing that experience has so fully confirmed its value in other cases.—*J. Sproule.*

(To be continued.)

Home Correspondence.

The Potato.—Notwithstanding the attention the Potato has received from its cultivators in field and garden, it is lamentable to observe how frequently a failure of the crop takes place, either intimating that a proper mode of culture has not been ascertained, or if known, has not been adopted with sufficient care. It is generally acknowledged that the chief source of failure exists in the tuber used for seed, and much anxiety is usually entertained amongst Agriculturists in order to obtain seed with germinating qualities unimpaired; but there can be as little doubt that other circumstances also enter into the realisation or disappointment of the farmer's hopes. A few remarks on these two topics of seed and circumstances, may find a place in your columns, as extensive and repeated observations have shown that there seldom or ever would be a complaint of failure if proper means were taken to avoid it. Potatoes intended for planting in the spring should not be dug up until the spring, but allowed to winter in the soil where they grew. This advice is a matter not of opinion, but of fact. On many farms, there is no doubt, this plan cannot be adopted, because the Potato-land is wanted for winter Wheat; but there are abundance of farms where it can, particularly hill-farms, where no Wheat is cultivated, and from which situations seed-Potatoes are in general procured. The practice, so far as I am aware, first took place accidentally. Frost and snow had set in early, before the Potato crop had been secured, and the consequence was, that a portion of it could not be got at again till winter had passed over. The farmer conceived that his undug crop would be totally destroyed by the frosts of winter, but he found that only the surface Potatoes were gone,—all others, even with a light covering of earth, escaped unhurt. These were used for seed, and sprouted without a single failure. Here it may be necessary to combat a common notion, that a very slight frost is sufficient to injure the tuber: it will only do so under certain circumstances; and these are, sudden thaws after exposure to frost. Every one knows that a frozen limb, if brought suddenly near a fire, would be killed outright; but if first rubbed with snow, then plunged in cold water, and the natural temperature afterwards gradually restored, it will live, and probably escape without injury. As with animal beings, so with plants; a sudden elevation of temperature is more disastrous than the mere exposure to frost, unless that is intense. This fact, with regard to the Potato, could be borne out by many examples—two may suffice. A quantity of Potatoes in an open shed were accidentally exposed to frost, so that they adhered in lumps by its influence; a portion of them was, immediately when noticed, covered thickly with straw, and allowed to thaw very gradually; the remainder were brought into a warm sun: the former, after the frost had by slow degrees gone out of them, were found to be uninjured, or nearly so; while the latter were very nearly useless. The other example is rather a curious one, although a verification of the proverb, that "too much kindness may kill." In the severe winter of 1814, the Potato-pits of the cotters and other labourers were for a protracted period frost-bound and inaccessible, so that on the accession of fresh weather there was a general move to get in a portion of the hoarded roots. It was found on this occasion, that in a number of the pits the Potatoes were frosted, and strange to say, these were in general found in those lots most deeply and carefully covered with soil! The frost storm had lasted so long and been so severe, as to penetrate even the most thickly-earthed pit. The thaw came with a very moist S.W. wind, and of course penetrated most readily into the shallowest pits. The thaw in these had been completely yet gradually effected, while in the others more thickly coated the frost was not displaced, when the Potatoes contained in them were exposed suddenly to the influence of a very mild wind. The plan recommended of keeping seed potatoes undisturbed in the soil wherein they have grown, is practised on a few farms in this vicinity (S.E. of Perthshire) with the desired effect of preserving unimpaired their vegetative properties. The same thing is practised by the natives of New Zealand, with this difference that the seed is left in the soil when grown to grow again another crop; this plan, of course, will not suit the farmers of Britain, but may sometimes be witnessed in gardens where a last year's Potato sprouts up, is allowed to stand, grows with great vigour, and generally furnishes an enormous crop. Where Potatoes are allowed to remain in possession of the soil which grew them, it is advisable to take up every other row or drill, and earth up the residue more deeply: this is the mode of procedure in the instances noticed, and the crop is almost as secure as if pitted or housed; in many cases more so, for there is no risk of dry rot. If farmers suitably circumstanced were to carry the above recommendation into effect, an adequate supply of seed Potatoes might be furnished for the market, and the hazard of failure almost cease to annoy us. Where Potatoes are kept over winter in the above natural manner, they may in general be cut into eyes with safety, which is not commonly the case with such as are taken up in autumn. If the latter are planted whole, a failure does not often occur. An extensive Potato-grower in this immediate vicinity never cuts a root, and scarcely ever fails of an excellent crop; he gives more room in planting both in the breadth of space between drills and in distance between the seed roots. We shall inquire into the circumstances suitable for the Potato in another communication. —*Vidimus.*

Bones.—"A. H., Aberdeenshire" states at page 188, that his "boiled bones were about 12 lbs. per bushel heavier than the unboiled." This is singular, as the unboiled bones which I used weighed 56 lbs. per bushel, whereas some boiled bones offered me for sale weighed only 28 lbs. per bushel. There is an extraordinary difference in these statements; I can only account for it by "A. H." having purchased his boiled bones "whole," whereas mine had been boiled after crushing, which would no doubt have the effect of extracting a much greater amount of grease, and probably cause a great difference both in weight and quality. It is very evident that there

is great variety in the bones offered for sale, and it is only by repeated experiments that their respective merits can be ascertained. It has, however, been clearly proved, in several instances, that land feels the good effects of unboiled bones for many years. Is this the case with boiled bones?—*E. R., Halifax.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held, at the Society's House in Hanover Square, on Wednesday last, the 17th of April, present, David Barclay, Esq., M.P., in the Chair, Thos. Raymond Barker, Esq., John Raymond Barker, Esq., W. R. Browne, Esq., Colonel Challoner, Capel Cure, Esq., James Dean, Esq., A. E. Fuller, Esq., M.P., Humphry Gibbs, Esq., Brandreth Gibbs, Esq., C. Hillyard, Esq., Fielder King, Esq., James Marmont, Esq., Townshend Mainwaring, Esq., M.P., William Miles, Esq., M.P., Alexander Ogilvie, Esq., Henry Putland, Esq., John Read, Esq., Joshua Rodwell, Esq., William Shaw, Esq., Professor Sewell, Richard Trench, Esq, Thomas Turner, Esq., Thomas Tweed, Esq., and Henry Wilson, Esq. The following new Members were elected:—

Eyre, Robert, Lyndhurst, Hants
Gray, Rev. James, Rector of Dibden, Southampton
Spear, William, Totton, Southampton
Smith, Rev. Alfred, Old Park, Devizes, Wilts
Frampton, John, Cerne-Abbas, Dorchester, Dorset
Hall, Joseph, Callington, Bromyard, Herefordshire
Clutterbuck, Rev. James Charles, Long-Whittenham, Abingdon, Berks
Napier, Peach, Mousehole Foundry, Millbrook, Southampton
Mountain, Rev. Thomas, Beighton Vicarage, Chesterfield, Derbyshire
Bottomley, Joseph, King's Villa, Pontefract, Yorks.
Hankey, J. Barnard, Fetcham, Leatherhead, Surrey
Wight, James Lane, Ledstone Court, Bromyard, Herefordshire
Cotton, Charles Robert, Broughton Hall, Worthenburg, Malpas, Cheshire
Worthy, Samuel, Temple-Coombe, Wincanton, Somerset
Brown, John, St. James's Street, London
Lloyd, J. A., Leaton-Knolls, Shrewsbury

Prize Essays.—Mr. Pusey, M.P., Chairman of the Journal Committee, reported the adjudication of the Society's prize of 50*l.*, for the best Report on the Agriculture of Wiltshire, to Mr. Edward Little, of Lower Sheldon Farm, near Chippenham, Wiltshire; and the adjudication of the Society's prize of 50*l.* for the best Report on the Agriculture of Norfolk, to Mr. R. N. Bacon, of Norwich. These Reports, containing a statement of the ordinary course of cropping adopted in the different soils of each county respectively; the breeds of cattle, sheep, and pigs, most generally bred or fed within them; the state of their drainage; the implements used; the number of horses or other cattle employed in the different operations of husbandry; the tenure on which the farms are generally held; the wages of labour; the average amount of the Poor's-rate; and whether any and what alterations and improvements have been made in the system of Agriculture pursued within the county of Wilts, since the Report made to the Board of Agriculture by Thomas Davis, and published in the year 1811; and within the county of Norfolk since the Report made to the Board of Agriculture by Nathaniel Kent, published in 1796, and by Arthur Young, in 1804. Mr. William Stace, of Berwick, near Lewes, in Sussex, announced himself as the author of one of the four essays on the Discrimination of Soils, which had been "highly commended" by the Judges; and expressed the satisfaction it gave him to place his essay in the hands of the Council for any use to which the Journal Committee might consider it as available in promoting the objects of the Society, "thinking that any essay on that subject might contain some fact or description of appearances that might be found of service to the chemical inquirer, and assured that every assistance ought to be rendered to the scientific man that the practical man could possibly afford." The Council ordered their best thanks to be returned to Mr. Stace for the permission he had granted, and his letter to be referred to the Journal Committee.

Seedsmen.—Messrs. Thomas Gibbs and Co., of Half-moon-street, Piccadilly, addressed a letter to the Council in acknowledgment of their official appointment as the Seedsmen of the Society, assuring the Council the mark of confidence the Society had conferred upon them in that appointment, would stimulate them to persevere in their endeavours not only to promote the interests of Agriculture in general, but to introduce all such seeds as appeared to them most likely to be useful, and to supply those only in every branch of their stock, which they could guarantee to be of the purest and most genuine description.

Natural Manure.—Mr. W. R. Churchill, of Colliton, near Dorchester, Dorset, transmitted to the Council a specimen of soil which on exposure to the air had become changed into a powerful manure for Grass-land, with the following account of its occurrence:—"I took the specimen now forwarded to the Council from a very high bank thrown up about six years since in a strong, sour kimmeridge clay soil, producing a coarse sedgy Grass and English Furze, not worth more than five shillings a-year rent. This bank was formed by a very deep ditch used for a drain as well as a protection to a hedge planted upon it. The substance in question appeared at a distance similar to white stone, and on inquiry I found had not existed in the bank when originally thrown up: there was a stratum of it about the middle of the bank in different stages of formation extending more than four hundred yards. The bailiff, in removing a bank in similar soil, but of better quality, found a large quantity of this substance, and on putting it over some good meadow land of a loamy soil on a clay bottom, he found it produce wonderful fertility, far superior to other manures. How this substance is formed is a mystery yet to be solved; at all events, it is not an original product of the soil, but is in a progressive state of formation. It is full of hairy filaments, with a cinereous white, soapy marl. It does not effervesce in sulphuric acid, and is of a fatty nature, not tasting of saltpetre, although generated by exposure to the atmosphere. The great question would be to ascertain whether any artificial process would expedite its formation; for if by throwing up heaps of this poor soil such a manure could be generated, the surrounding barren land might be greatly meliorated and become worth cultivation: it is within three miles of Weymouth, far removed from the chalk formation.

Artificial Manures.—Mr. Miles, M.P., called the attention of the Council to the desirableness of including in the model experiment, proposed to be tried this year by various members of the Society, and which would be brought before the Council for final consideration and adjustment of detail at their next meeting, a comparative trial of the respective merits of the South American and African Guanos, applied in equal quantities to the land. An interesting discussion then took place on the facility with which artificial manures of every kind could be adulterated, the various modes in which this practice was systematically conducted in the metropolis and elsewhere, the importance of the strictest scrutiny into the quality of such manures, and if possible the application of some simple and efficient test, by which the amount of adulteration in the sample of each of the different manures intended to be purchased could at once be estimated.

Swedish Turnips.—Mr. Alexander Ogilvie informed the Council that during the nineteen years he had lived as agent with the late P. L. Brooke, Esq., of Mere Hall, Cheshire, he had experienced very great and uniform success in the management of his Turnip crops, a result which he attributed to the quality and amount of manure he had employed, and the early growth he had given to the plant by sowing the seed in immediate contact with it in a state of active fermentation. One of his fields, from which in 1840 he had obtained no less an amount of Swedish Turnips (cleared of tops and bottoms) than 43 tons per statute acre, was a clayey loam with a retentive subsoil, effectually drained with tiles some years ago by cutting the drains not more than from five to six yards apart. In 1839 it was broken up from pasture for oats, the crop being good, and as soon as the oats were cut and removed from the field, he had the stubble skim-ploughed from three to four inches deep; in that state he allowed the field to remain a month or five weeks, and then had it ploughed from sixteen to eighteen inches deep with Smith's subsoil plough. After this operation, the field was not again disturbed until the spring of 1840, when he had it harrowed as soon as it was sufficiently dry. Between the end of March and the third week of May, he had it ploughed and harrowed three different times. From the subsoil ploughing in the autumn, the ground was very mellow in the spring; and after it was three different times ploughed and harrowed, the soil was very fine. The next operation was forming the drills, which were about 30 inches apart. While this was going on, he had the dung, in a moist state, carted out, and spread in the hollow between the drills, with some bone-dust sown over it and covered in immediately (to prevent evaporation) by having the drills split out over them. The quantity of dung per statute acre applied, was from 26 to 28 tons; and over this dung, he had sown with the hand about half a ton of the best raw-bone-dust per statute acre. After the dung and bone-dust were covered in, from two to three inches from the surface by the splitting of the drills, he immediately, while the dung and ground were moist, had the seed sown by a machine, at the rate of 3lbs. weight per statute acre, taking care that it was deposited in the dung; and thus, by being so deposited, it vegetated immediately, and grew out of the way of the fly in the course of 8 or 10 days. The moisture of the dung and soil, and the heat occasioned by their admixture with the bone-dust, forced the plants for the first fortnight as favourably as if placed in a hot-bed. At the end of this period, the plants were almost ready for singling out, which, as soon as they would bear the operation, he had done with the hand-hoe from 14 to 16 inches apart.—Mr. Ogilvie stated, that this was the method he had adopted in Cheshire, during a period of 18 years, and had never once missed a crop. He believed the lightest crop he ever had during the whole of that period, exceeded 36 tons per statute acre. He never sowed later than the last week in May, and whenever weight of crop was wanted, he thought it absolutely necessary to sow during that month. The seed was obtained of Mr. Skirving, of Liverpool. The plants were twice horse-hoed, and once hand-hoed after singling. In the previous season all the crop was removed from the ground by the latter end of October. It was ploughed and sown with Wheat during the first week of November; and it was in reference to this grain crop that the unusual amount of manure applied to the Turnips was found, in the result of produce in both cases, to be both advantageous and economical.

Draining Level.—Mr. W. B. Webster, of Hounsdown, near Southampton, presented to the Society one of his newly-invented Levels for the purposes of draining. This level is formed of an oaken rectangular rod, turning upon an axis placed at the middle of its lower surface, and by means of a plate and screw secured firmly at a horizontal level or any given inclination. On its upper surface, immediately above this centre of motion, is placed a small spirit-level; and at each end of the rod an upright plate of brass, containing the cross wires. At the end nearest to the observer, is placed an additional sight moveable by means of a screw within a graduated groove, which indicates by the value of its divisions not only the line of horizontal level, but the rise and fall of distant objects above or below the place of observation. Mr. Webster claims for this instrument the advantages of cheapness, great simplicity, and its requiring no second person for its use; in addition to its capability of giving by inspection the rise and fall of land intended to be drained.

Horse Wheat-Hoe.—Mr. John Bowers, of Westdean House, near Chichester, expressed his intention of exhibiting at the ensuing Southampton Meeting in July, an instrument invented by the Rev. L. Vernon Harcourt, for hoeing the drilled Wheat on his own farm, which had been found practically useful for that purpose; and Mr. Bowers had no doubt, from the experience he had himself had in the employment of the implement in question, that it would be found of great use, being very simple in its construction, and different in principle from all implements hitherto invented for the purpose of hoeing.

Small Farmers.—Mr. Nicholls, as one of H.M.'s Poor-law Commissioners, having become extensively acquainted with the condition of the small Irish farmers, during his official connection with that part of the kingdom, and convinced of the great advantage they might derive from the cheap circulation among them of a compilation on farming topics, adapted to their comprehension, requirements, and actual condition, undertook the task of preparing a work of that character, under the title of the "Farmers' Guide," which had passed through two large editions. The success of that publication, compiled with the view of imparting useful information to the small Irish farmer, and stimulating him to the adoption of improved methods of cultivating his land, had induced Mr. Nicholls to undertake, with the same disinterested motives, a work which might prove advantageous to the same class of farmers in England, exceeding in number, and he believed in extent of occupancy, the larger and more intelligent class of farmers, taking the country from end to end. In this compilation, Mr. Nicholls had endeavoured to form a compendium of all information essentially necessary, in a practical sense, to the parties for whom it was intended—excluding everything of a speculative or dissertational character, and recommending to their notice those points and details only, which had stood the test of experience: having been careful to be as brief, simple, and clear as possible on every topic. As he had given the copyright of the work to Mr. C. Knight, he had no further interest in its distribution than a desire that the small farmers for whose use it was compiled, might be enabled to reap whatever benefit it was calculated to confer; and in order to render its publication as cheap as possible, Mr. Knight had included the work under the title of "The Farmer," in his series of "Guides to Trade, Service," &c.; circumstances which he hoped would facilitate its circulation, and induce landed proprietors to purchase it for distribution among their tenantry, as had been done to some considerable extent in Ireland, with Mr. Nicholls' previous publication. Mr. Nicholls concluded his communication by hoping that, as the efforts of the Royal Agricultural Society of England were unceasingly directed to the promotion of improvements in every shape, they would grant him the satisfaction of finding that his little work, intended within its own sphere to accomplish the same object, would not be considered altogether unworthy of their approbation.—The Rev. John Barlow, Secretary of the Royal Institution, communicated to the Council a general invitation to the Members to accept a free admission to Professor Solly's Lecture, in the theatre of that establishment, on the ensuing Friday evening, the 19th of April, on the Chemistry of Vegetation and its general application to Agriculture.—Mr. Ermen, of Manchester, addressed a letter to the Council on the subject of the prevalent disease in Potatoes.—Mr. Shaw communicated a letter from Viscomte de Secqueville, on the subject of a monument intended to be erected in honour of M. Dombaste.—Sir Charles Morgan presented copies of the prize-sheets of his show at Court-y-Bella, on December 18, next.—Mr. Hutchinson presented a copy of his work on the Practical Drainage of Land.—Messrs. Gibbs and Myers, copies of their collection of results in the trials of guano by their correspondents.—Mr. Purchas, copies of the Reports of the Monmouth Farmers' Club.—Professor Bernays, copies of his Lectures on the Theory of Agriculture.—The Statistical Society, Labourers' Friend Society, and Guernsey Agricultural Society, copies of their proceedings;—and Mr. Nowell, a copy of his work on Self-supporting Schools of Industry and Mental Discipline; for all which, and other communications, the best thanks of the Council were ordered. The Council then adjourned to Wednesday next the 24th of April.

AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

At the meeting of the Council, on the 10th inst., upon considering the premium sheet, and the rules and regulations of the approaching Cattle Show, it was ordered that the article offering premiums for male animals, should be so framed as to require that the animal should remain in the country for a definite period, and at a proper season after the Cattle Show; and also that it be an instruction to the judges of breeding stock to give a decided preference to such as shall appear in a healthy but not over-fed condition; the Society being anxious to mark strongly the evil effects both upon the utility of the individual animals and upon their breeds, of keeping bulls in too fat condition. The half-yearly meeting of the Society was fixed to take place on Friday, the 19th inst.

FARMERS' CLUBS.

Beccles.—At the last meeting the subject under discussion was Mr. Stace's Prize Essay on the Rotation of Crops for Heavy Lands. The rotation therein recommended was a continual course of cropping; this, at first, appeared so extraordinary, that it was thought impracticable; but, upon

more mature consideration, the objections were not so great, and it was argued by some members that the rotation might be pursued upon what we here call good deep heavy lands, though upon the generality of wet soils it was agreed as not being desirable to depart from the long-established course, commonly called in Suffolk the four-course shift, viz. fallow or Turnips, Barley the following spring, then Clover or Beans, followed by Wheat. This has been the system for many years in both Norfolk and Suffolk upon wet heavy lands, though of late a proportion of Tares have been grown upon the Wheat stubbles —some part for soiling with horses in the summer, and the remainder fed off with sheep; the land being then broken up, and fallowed for Barley. It has, however, been found that such Tare-land is not kind for Clover; it is, therefore, usual to grow the Tares upon that proportion of the quarter intended for Beans, after the Barley crop is removed.—*C. Gibson.*

Probus.—At the last meeting of this Club, a lecture was delivered by one of its members on the Various Insects affecting the Turnip Crop. The lecturer confined himself chiefly to three of the most formidable enemies which infest the Turnip crop—the Turnip fly or beetle, the caterpillar, and the wire-worm. Respecting the first, the Turnip flies, it appears that the history of these little pests for a long time puzzled, not only the practical Agriculturist, but the man of science likewise; but it is now better understood. They hybernate, or live through the winter in a torpid state, and may be found under the bark of trees, &c.; but, inactive as they are during the winter, on the first indication of spring, they quit their winter quarters for sunny situations, and feed in gardens on Cabbage-plants, as early as March, and in April they get away to the fields. May and June are the periods when they are to be most dreaded by the farmer, just as the young Turnips are coming into leaf. The sexes pair between April and September, and the female beetle lays her eggs (about one egg daily) on the under side of the leaf. It requires about 30 days to carry the insect through its various stages, up to the time when it becomes a perfect fly or beetle. It remains an egg about 10 days, a maggot 6 days, and a chrysalis 14 days. It is, however, in their last and perfect stage that these insects are most to be dreaded. It is the beetle that destroys the two first smooth leaves of the Turnip by piercing them like a sieve, destroying the cellular tissue, and stopping the growth of the plant. It was at this stage of their existence that the lecturer recommended an instrument now frequently used by Cornish farmers, called the fly-catcher—a board newly painted or tarred—which, while the flies are numerous, should be passed over the same ground three or four times a day; by which means myriads may soon be destroyed. The lecturer then alluded to the effect of lime, sulphur, soot, fumigation, and many other remedies, but did not think they could be depended on. He believed that thick sowing, and the use of artificial manures, drilled in with the seed, were more effectual, as the Turnip, when in rough leaf, is not in any danger from the attacks of the beetle; therefore, it must be evident that our first care must be to force on the young plant, and this can only be done by proper manures, or using such means as he had recommended to destroy or drive them away. Just after the Turnips have outgrown the attacks of the fly, they are liable to the ravages of the caterpillar, which the lecturer considered as only a less formidable enemy, because there are fewer seasons which produce them in sufficient abundance to injure a crop materially; for when they do become numerous, there is no greater pest. With respect to the remedy, the lecturer said that the only one which he knew was picking them by hand. He knew of some fields that had been cleared of caterpillars by means of a flock of ducks driven on them; but there are some kinds which ducks refuse. About the same stage of its growth the roots of young Turnips are exposed to another formidable enemy—the wire-worm, which is the most troublesome of all insects to the Agriculturist. It appears that we are yet very imperfectly acquainted with these insects: it is stated that there are upwards of 60 different species of them. It is probable that a very considerable portion of these feed upon our most valuable cultivated plants. The rooks will destroy them, but these birds, while searching for other prey, pull up sound and mutilated plants indiscriminately, so that both worms and Turnips are united in one common distinction. In this case we should say, "Save me from my friends." The lecturer considered that the rooks were increasing too fast; their numbers were so great, that they frequently caused much trouble to the farmer. He would diminish them, but certainly not destroy them altogether.

Reviews.

On the Evils arising from the existing Irregular and Unreasonable Division of Land into Fields (der Flurzwang.) By Prof. Knaus. Stuttgard, 1843, Cotta, 8vo.

A SHORT notice of this work will show our readers the minute attention which our continental neighbours pay to every branch of Agriculture. It may also be useful to those engaged in parcelling out land in the many extensive inclosures that are taking place; and still more so to our Agriculturists in the Colonies. Amongst the many impediments which check the exertions of the small farmer, the "field-constraint" * occupies a prominent place, preventing, as it does, the owner of small plots of land from cultivating or otherwise using his ground in the best manner. The above work, intended to obviate this inconvenience, begins with an exposition of the origin and the disadvantages of the "field-constraint," to which an inappropriate parcelling out of the fields, the want of proper by-roads and a proper direction of the drains, the shapeless form of single fields, and a constant interference and collision of neighbouring farmers, are owing. In several parts of Germany (especially in Nassau) means have been taken to obviate this inconvenience by a systematic division of the fields, and Prof. Knaus contends, that it is only by relieving the small farmer of every such restriction that Agriculture can reach its highest degree of perfection. This new parcelling out of fields is to be made on the following principles:—1. That the tithings or estates should be intersected by regular by-roads, in accordance with the nature of the lands. 2. That all fields, or at least the greater part, should have such a regular form, that all encircling or crooked-shaped fields be as much as possible avoided. 3. That all the fields should abut with their smaller extremity, if not with both, on a by-way, so that every owner, even of the smallest plot, should be able to approach his field without intruding on other people's ground; and it might thus be also possible that the ploughmen could turn on the by-way, being neutral ground. 4. That all fields situated within the same natural boundary, being nearly all of the same length, should differ only in breadth, and that irregular forms be avoided in all possible cases. 5. That a division of single plots should only be permitted as far as their breadth is concerned, and this merely to a certain extent; no division to take place so as to isolate a plot altogether from the by-way, by which that vexatious right-of-way system would be again unavoidably introduced. 6. In all cases where a new parcelling out of plots of land takes place, care should be taken that each farmer should take his plot next to one he already possesses, the necessary regard being paid to the quality of soil, &c. 7. The above, however, are not to prevent, but rather to facilitate, the exchanging of land between owners of fields on the same, nay, even on different plots of land, so that the number of subdivisions on the same plot should be decreased as much as possible. 8. The limits of anciently-established plots should by no means be respected, especially if they be based on unnatural demarcations; and their number should be decreased as much as possible; also all unnecessary by-ways, ditches, drains, &c., should be abolished. 9. The new by-ways should be so macadamised with stone, that they would be passable in every season, especially in winter, by dung-carts or waggons. 10. The drains, as well the open as the covered ones, after having been properly laid out, should be kept in repair at the expense of the hundred or tithing.

The author does not shrink from acknowledging the many difficulties in the way of his plans (especially in plots of land much cut up by differently-owned fields); yet he shows from experience that such difficulties may be overcome by an earnest desire to be useful to ourselves and posterity, and points out the best means to effect it. The impediments hitherto thrown in the way of abolishing "field-constraint" appears to Dr. Knaus to be capable of the following arrangement:—1. Want of instruction and encouragement; 2. Deficiency of good surveyors acquainted with the circumstances of agriculture; 3. Want of harmony in the farmers; 4. Financial impediments; 5. Objections raised by landed proprietors, mortgagees, surveyors, &c.; 6. The fear of the instability of such improvements, on account of the legislature not paying sufficient attention to the evils produced by irrational parcelling out of fields. The author therefore proposes that the assistance of the law should be given to such transactions, in so far that the owners of every hundred should have an absolute right to decide about the future demarcation of their ground, according to a majority of votes, the number of votes to depend on the quantity and quality of land possessed. As the votes would not only give rights, but also imply obligations, the author thinks that the interests of the minority would be secure from any undue encroachment. By these means, also, we should avoid regulations being laid down on a too general basis, which would not tally with the nature and circumstances of special localities. If, therefore, the law would leave these particular arrangements to the owners of land themselves, it is not to be apprehended that they would do anything contrary to their own interest. In a legitimate decision of a legitimately-chosen majority, every owner of land would, whilst he may, to a certain extent, sacrifice a portion of his unbounded territorial rights, yet be sure that he has done so for the great good of the whole, which would, in the long run, turn to his own individual advantage.

Dr. Knaus proceeds, in the subsequent parts of his work, to establish the following rules, in relation to the doing away with "field-constraint:"—1. That the question, whether and by whom the hitherto faulty field-division of land should be rectified, is to be decided by a general meeting of the owners, and be binding even on those of the minority. 2. That the law should only regulate the minimum of each parcelling-out of fields, in the most general terms, the special stipulations to be left to the owners of fields in every hundred, tithing, or plot; this to be done, moreover, in accordance with the circumstances of locality, quality of soil, &c. He then states the advantages which have been derived in Nassau from similar arrangements (the so-called consolidation of land), on about 80 plots of land, and an area of more than 100,000 Berlin acres, and corroborates his assertion of the necessity of a somewhat stipulated minimum in the parcelling out of land, by the conviction that without it the beneficial results of a rational and judicious subdividing of landed property could not have been accomplished. He states some striking examples, how the value of property has increased by the abolition of the hitherto existing boundary restrictions, in which all care has been taken duly to compensate the small owners. Amongst others, he points out the case of a plot of meadow land, which, being properly arranged, according to the above plan, yields now 30 cwt. of Hay, instead of 3 per acre, as it used to do before, because draining had become possible under the new arrangement. The author states further, that a greater freedom of Agriculture, and the satisfaction of cultivating land properly divided, must follow the adoption of his plan.

The work of Dr. Knaus is furnished with seven maps; Nos. 1 and 2 contain the ancient and new division of fields in the tithing of Wiblingen, in the Electorate of Baden; 3 and 4, the same, in another tithing; the others are ideal plans of a tithing where the ancient faulty division of fields is changed for a rational and judicious one.—*J. L.*

* This is the literal translation of the German word *Flurzwang*; the meaning of the word may be gathered more fully from the translation we have made of it in the title above.

Miscellaneous.

Fixing Ammonia.—In dung reservoirs, well constructed and protected from evaporation, the carbonate of Ammonia which forms in consequence of putrefaction is retained in solution; and when the putrefied urine is spread over the land, a part of this Ammonia will escape with the water which evaporates. On account of the formation of carbonate of Ammonia in putrid urine, it becomes alkaline, though naturally acid in its recent state; and when this carbonate of Ammonia is lost by being volatilised in the air, (which happens in most cases,) the loss suffered is nearly equal to one-half of the urine employed. So that, if we fix the Ammonia, (by combining it with some acid which forms with it a compound not volatile,) we increase its action twofold. Now this can be done in many ways *** If, for instance, a field be strewed with gypsum, or plaster of Paris, (in chemical language, sulphate of lime,) and then sprinkled with urine, or the drainings of the cow-shed, a double exchange or decomposition takes place; sulphate of lime and carbonate of Ammonia become converted into carbonate of lime (that is, chalk) and sulphate of Ammonia; and this because sulphuric acid has a greater affinity for Ammonia than it has for lime. This sulphate of Ammonia will remain in the soil—it will not evaporate.—*Smith's Productive Farming.*

Milking Properties of different Breeds of Cows.—From these reports (as may be seen by their summary) it appears that the milk of the Kerry cows was richer in cream than that of either the Ayrshire or the Galloways; but rather inferior to the former in point of quantity.

KING WILLIAM'S TOWN DAIRY.

Experiments on Ayrshire, Galloway, and Kerry Cows, from the 18th day of April to the 17th day of June, 1841.

—	Total Number of Quarts milked.	Number set for Butter.	Number given to Calves.	Number of Quarts sold.	Number of Pounds of Butter produced from Milk set for Butter.	—
3 Galloway cows	1134½	1115½	17	2	117½	9½ quarts of milk produced 1 lb. of salt butter.
Average number of quarts milked from 3 Galloway cows from the time of calving till the present date, 6¾ quarts per day each.						
4 Kerry cows	1769	1698	64	7	191	8⅞ quarts of milk produced 1 lb. of salt butter.
Average number of quarts milked from 4 Kerry cows from the time of calving till the present date, 7¼ quarts per day each.						
9 Ayrshire cows	4313½	3086	1202½	25	302	10 1-5th quarts of milk produced 1 lb. of salt butter.
Average number of quarts milked from 9 Ayrshire cows from the time of calving till the present date, 9 quarts per day each.						

The above 9 Ayrshire cows, when milked the first summer in 1838, having then produced their first calf, and each three years old, gave in the month of July 67½ quarts per day, being an average number of 7½ quarts to each cow per day. The same Ayrshire cows being six years old at May, 1841, each having produced four calves, gave in the month of June, 1841, 93 quarts per day, average number 10⅓ quarts to each cow per day for the month of June, being an increase of 2 5-6ths quarts of milk to each cow per day for June. The above four Kerry cows had each produced their first calf, and were four years old at May, 1841. The above three Galloway cows had each produced their first calf, and were three years old at May, 1841.
—*English Agricultural Society's Journal.*

Experiments with Manures.—Having used a large quantity of guano in raising green crops at Ballyhidy, and having made a few experiments with different manures, I inclose a table showing the results. The green crops after Oats, the soil an adhesive clay, but all furrow-drained, and subsoil-ploughed 15 ins. deep, and limed, 50 barrels per acre, before the crops were put down—the land is now greatly improved and perfectly dry. A portion of the drained ground was trenched, but the produce was 30 per cent. less than when the subsoil was not brought to the surface.

Quantity of Swedes growing on One Scotch Acre, from different kinds of Manure, sown May 19, 1843.

Varieties of Seeds.	Manure.	Cost. £	s	d	Produce Tns	Cwt
Laing's Swede..	Bones.....30 bushels	3	0	0	26	3
Do. do.	Guano, 2 cwt. Bones, 15 bushels	2	10	0	34	2
Do. do.	Guano..... 4 cwt.	2	0	0	30	16
Do. do.	Farm-yard Manure 40 Tons.	6	0	0	33	15

The guano was mixed with coal-ashes, 4 cwt. ashes to 1 cwt. guano.—*A. Templeton, Dublin Farmer's Gazette.*

Stall Feeding.—Every one will admit the superior value of artificial grasses, who has made a fair trial of the difference between feeding cattle upon them cut green and given within doors, and on the other hand in turning cattle out upon a common pasture. A trial of this kind

was once made in Scotland, and it was found that 27 head of cattle were as well kept upon the same quantity of ground in one method, as 18 in the other. Added to this, there is an immense saving in the making of manure, which process, the most important one of any, may be going on during the whole summer, instead of having what dung falls, scattered abroad, and dried up in the heat of the sun.—*Rawstorne's Remarks on Lancashire Farming.*

Sub-soil Ploughing.—The first object sought to be obtained by the operation was deepening the soil; *the second*, facilitating the descent of surface-water where the sub-soil was retentive; and *the third*, to secure the beneficial influence of the atmosphere and manure to a greater depth. The first object is described as mechanical, deepening the soil so as to remove obstructions for the more easy and perfect performance of all the operations necessary to correct cultivation; and the essay points out the advantages of this mode of deepening the soil, over the frequent practice of carrying on earth. "To cover an imperial acre one inch deep with soil, would require a fraction more than 134 cubic yards. It is well known that a cubic yard is a good cart load, and if brought from any distance at all, with filling, spreading, &c., would not cost less than 1*s.* per yard; this would amount to 6*l.* 14*s.* 5½*d.*, an expense sufficient to sub-soil plough the land, and leave more than 5*l.* to be applied in manure; this, at the present price of guano and bone, would purchase 7 cwt. of the former, or 40 bushels of the latter, being double the quantities of these manures usually applied to an acre, and undoubtedly sufficient to manure several inches of sub-soil." The second object may also be said to be mechanical; when the sub-soil is retentive, or when "a pan or cruit" exists, this does much good, by facilitating the descent of water, and by equalising the supply of moisture during drought, not only by capillary attraction, but by allowing the roots of plants to penetrate freely below the parched surface into a cooler and damper medium. But besides its mechanical operation, it is intimately connected with, and lays the foundation of the third, and most important change, that of allowing the influence of the sun and air to penetrate, and, by the filtration of rain, to make that one of the most beneficial, which had previously been one of the most detrimental of atmospheric agencies; thus producing such remarkable changes as are often seen by the draining and deep cultivating of land, without any visible foreign chemical agent or re-agent being introduced. Then follows a detail of a number of experiments, tending to show the advantages of the operation on various soils—on thin soils with open shelfy killas sub-soil—on blue and other clay sub-soils—on granite soils when the bottom is retentive—and in cases in which the actual sub-soil plough had been used, and the soil and sub-soil had been deep ploughed up by the common plough and mixed together. In conclusion, it is stated, "that if the experiments are not held to prove the advantage of sub-soil ploughing, they prove that it is not injurious. In no case where the writer has seen either deep working with the common plough, or with the sub-soil plough, has it had the least injurious effect; but, on the contrary, the crops have turned out beyond his expectation. And if, as will be conceded, a deep soil is better than one of a contrary character, and if it be of importance *permanently* to improve land, this appears to be one of the most feasible and necessary preliminary steps. Not that all land requires such a process; nor should a practice be condemned from having been tried without producing any good effect where it was absolutely not needed. In regard to the expense of the operation, it may be slightly different in different soils and situations; but where four ordinary horses draw the sub-soil plough, with two going before with the common plough, three-fourths of an acre may be a fair day's work. At this rate the cost would be per acre—

	£	s.	d.
One pair of horses and a man 1½ day, at 8*s.*	0	10	8
Two ditto and two ditto, 1½ day, at 16*s.*	1	1	4
Tear and wear, say	0	2	8
	£1	14	8
The land having to be ploughed, at any rate the single plough ought not to be charged against the sub-soiling, therefore deduct	0	10	8
Leaving	£1	4	0

as the additional expense for sub-soiling an acre."—*Report of Mr. Peter's Prize Essay, read before the Cornwall Agricultural Association, December*, 1843.

Manures are to farming what blood is to the animal frame; divested of their aid vegetation languishes, as the abstraction of the other leads to dissolution. Of all manures that are in use, commend your friends, I pray you, to that from the farm-yard. Much goes to waste about every steading, that, being otherwise carefully used, with a trifling amount of labour might be made available in superseding the use of artificial or foreign manures. Guano, I have found, under certain circumstances, to be excellent, when of pure quality—an article rarely to be found—producing fine Potatoes and good Oats. Clover treated with it has also done well, and seems to be deeper coloured than that from farm-yard manure; yet, tested on poor ground (recently reclaimed bog-land) compared with the latter, I have found it to fail. I have no doubt it has more of a speedy stimulative than a lasting nutritive quality, and, therefore, ought always to be used in conjunction with farm-yard manure, which it cannot, and should not be allowed to supersede. It perhaps ought not to be used at all, excepting under peculiar circumstances, or in the least accessible situations; certainly not after a sufficiency of green crops can be raised to enable the farmer, by the aid of house-feeding, to make plenty of dung for his land.—*Mr. McArthur, in the Ayrshire Agriculturist.*

Notices to Correspondents.

Barley.—*A. S.*—A bushel of good Barley weighs from 52 to 55lbs.

Blossom.—*W. S.*—We know of no application of *manure* which will hinder a plant from blossoming. Mr. Knight, we believe, ultimately obtained a variety of Potato without blossoms, by repeatedly growing the tubers of plants from which the blossoms had been plucked immediately upon their appearance.

Chemistry of Agriculture.—*Tropicus.*—Read Johnston's "Agricultural Chemistry and Geology." The advantage of liming land does not depend upon its introducing carbon into plants, except in so far as it is a solvent, so to speak, of humic acid, which contains much carbon. Plants require mineral as well as organic substances in their food, and among these is lime. See Dr. Smith's article in another page. The principles of Agricultural Chemistry act independently of climate.

Churns.—*Toby.*—The small metallic churn is useful for families.

Cloacine.—*W. C. A.*—You are right in mixing it with an equal bulk of vegetable mould; throw over every cubic yard of the mixture about 10 lbs. of sulphuric acid, diluted with such a quantity of water or other matter, as will enable you to mix it thoroughly. Sulphate of soda is useful as a manure, where there is a deficiency of it in the soil, but as it will not decompose the carbonate of ammonia, it would not fix ammonia in cloacine. Where it is needed, it may be spread broadcast on Grass or young Wheat, now, at the rate of 1 to 2 cwts. per acre; unless, however, you have a special reason for selecting it, you would probably obtain a greater crop by the application of guano.

Diskases of Cows.—*W., Sheffield.*—If you will favour us with your name and address, we will forward to you information on the subject.

Field-beet.—*H. C. S.*—The Globe Mangold Wurzel is preferable to the other on shallow soils. You had better try it instead of Turnips, after Swedes. The seed can be easily sown by one of the Suffolk drills, with or without a mixture of sand. Potter's guano will probably suit you.

Food for Cows.—*A Tivyside Cow-Fancier* will be much obliged to a "Cow-fancier" for information as to the kind of Carrot he uses, and whether he feeds his cows on hay or straw besides.

Guano.—*Cor.*—Your specimen is good guano.

Gypsum.—*S. R. S.*—Mix it with farm-yard manure; spread, and plough or dig it in. Salt and soot may be more beneficially applied along the tops of the drills, just as the Potatoes are coming through, than in the drills along with the sets.

Liquid Manure.—*I. X.*—You may have a roughly-made filter, of considerable size, filled with fragments of gypsum, through which the runnings of the stable must pass before reaching the tank, and renew the gypsum now and then; this is Professor Liebig's suggestion. The surest, and when near the factory, the cheapest plan is to pour in it, say every week, as much sulphuric acid as will fix the ammonia in the quantity added each week.——*Subscriber.*—Water will not dissolve all the guano; a portion, and a very valuable one, is left behind. It is a better plan to apply it as recommended by Mr. Booth. (See Home Correspondence.)

Manure.—*J. Ridge.*—If you have enough good manure to put on your land at the rate of 30 cubic yards per acre, you do not require anything else. If you have not got sufficient for this, you had better mix with it 4 cwt. of guano for each of the acres for which, at the above rate, you have no manure, and then divide the compost equally over the land.

Moss.—*B. K. M. S.*—A sufficient application of lately-slaked lime is said to act beneficially, but there is no certain remedy except breaking up the pasture, cropping it for a year or two, and laying it down again.

Soot.—*Anon.*—The red soot you allude to probably differs from the black in being ferruginous; but we never saw it. In what chimneys, and in what parts of them, does it accumulate?

Transplanting.—*A Reader* informs "W. S." that Beet can be transplanted with perfect success, if watered with a very dilute solution of nitrate of soda immediately after sowing.

Urate.—*G. S.*—Peat charcoal would fix the ammonia of the stable-runnings, and would be a valuable manure.

Windmills.—*A. H.*—Steam will, in the end, prove a more economical power than wind. Windmills were at one time erected in considerable numbers, to work threshing-machines, in the Lothians; but steam-engines are now being substituted for them. The uncertainty to which you allude renders windmills unfit for Agricultural purposes. We should be glad to know your experience and analyses connected with Mr. Campbell's processes.

*** As usual, many communications have been received too late.

Beasts, 2725; Sheep and Lambs, 24,940; Calves, 89; Pigs, 350.

We have to-day a very short supply, the time of year considered, and the trade for everything is improved. The town is very clear of meat; the supply to the dead markets has been very limited of late, consequently everything meets a very ready sale. The best Scots, &c., readily make 4s, and the best Short-horns from Norfolk 3s 8d per 8 lbs; those from Lincolnshire make about 2d per 8 lbs less. The trade for Mutton is still brisker then the Beef, at an advance of fully 2d per 8 lbs. The shorn Sheep are getting more in request every week as the weather gets warmer. Lamb, also, is in greater demand, and trade for it is brisk, at prices above quoted. Veal maintains its price, but not very active. Pork is rather heavy, but neat Porkers maintain their price.

Friday, April 19.

There is a slight depression in the trade to-day, and a small decline in prices. The best Scots do not make quite 4s, and the best Norfolk Short-horns hardly 3s 8d: many from Lincolnshire make very little over 3s 4d, per 8 lbs. The Mutton trade is hardly so good, the best Downs only making 4s 4d, the best Longwools, 4s 2d, shorn Downs about 3s 10d, and shorn Longwools about 3s 8d, per 8 lbs. We cannot notice any alteration in Lamb, Veal, and Pork. Monday's trade has caused many to be sent in by the various railroads, which has given a dulness to trade for all kinds of stock.

Beasts, 784; Sheep and Lambs, 7700; Calves, 128; Pigs, 362.

41, West Smithfield.

POTATOES.—Southwark Waterside, April 15.

The weather during the early part of the week was oppressively hot, and it being the holiday week, a further depression in the market has been the result; the best samples went off heavily, and our last quotations have not been maintained. Since our last Report there have been arrivals from most of the shipping districts, and the supply may be considered rather liberal. Some cargoes of Whites from Holland are selling at 50s per ton. The weather towards the close of the week has been favourable for the consumption, and the demand a little better—notwithstanding, the annexed prices have been barely supported.

COVENT GARDEN, April 19.—The market has been well supplied this week with most articles. Hothouse Grapes are becoming more abundant, and are in consequence getting cheaper. Pine Apples of good quality are sufficient for the demand; they are offered at the same prices as are quoted in our last report. Apples do not meet with a ready demand; dessert varieties are a little reduced in price. Little alteration has taken place in the price of Pears since our last report. Oranges, although not quite so plentiful, are sufficient for the demand. Lemons are not altered in price. Chesnuts are getting scarce, as are also Spanish Nuts. During this fine weather Vegetables improve rapidly, and are, generally speaking, becoming lower in price. Good Broccoli is offered at from 6*d.* to 1*s* 6*d.* per bundle. Greens are becoming scarcer, and are a little advanced in price. Carrots and Turnips continue good and plentiful. Seakale and Asparagus are very abundant. French Beans are becoming cheaper. Rhubarb is very plentiful. Cucumbers are now becoming more abundant, and they are good in quality, as are also Strawberries; the latter are somewhat reduced in price. Frame Potatoes are selling at from 2*s.* to 3*s.* per lb.; they are most plentiful. Cut Flowers chiefly consist of Erica rubra-calyx, Hovea Celsii, Nemophila insignis, Gnidia pinifolia, Lily of the Valley, Pelargoniums, Cinerarias, Fuchsias, Epacrises, Acacias, Camellias, Azaleas, China, Provence, and Moss Roses.

WOOL.—British, Friday, April 19.

There has been rather more doing in our English Wool Market during the last few days; this may be accounted for by the large number of Manufacturers who are in Town attending the Colonial Wool Sales. Prices are stationary, but there is a disposition on the part of most to effect sales, though at a shade lower price. The Colonial Wools are selling briskly, at prices fully as high as the last.

James Perrin, Wool Broker.

MARK LANE, Friday, April 19.—We have no fresh arrivals of English Wheat offering on Market this morning, but its value may be considered quite equal to our quotations of Monday; in free Foreign there has been an increased business doing, both on Wednesday and to-day, particularly in low qualities to country buyers, and late prices are fully supported—the fact of so small a quantity entered at the 16*s.* duty having given confidence both to buyers and sellers.—Barley is a very dull sale, and barely supports its late value; several cargoes are being landed, the want of demand rendering them almost unsaleable.—In Beans and Peas we observe no alteration.—The supply of Oats is good, and they meet a fair sale, at quite as good terms.

Mark Fothergill.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c., &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 130, Fleet-street. A Prospectus may be had, detailing the prices, &c.

IRON WORKS.

COTTAM AND HALLEN, WINSLEY-STREET, OXFORD-STREET, LONDON.

GARDEN ROLLERS, 18 inches long, 34*s.*; 20, 44*s.*; 22, 50*s.*; 24, 60*s.*; 26, 75*s.*; 28, 84*s.*; 30, 105*s.*

GARDEN SYRINGES, 9*s.* 6*d.* each.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3*s.* 6*d.*; 20 inches, 4*s.* 6*d.*; 22 inches, 5*s.* 6*d.* each.

CAST-IRON FLOWER-STAKES, 4 ft. long out of the ground, 7*s.*; 4 ft. 6, 9*s.*; 5 ft., 11*s.*; 6 ft., 15*s.*; 7 ft., 20*s.* per dozen.

Watering-pots, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of article used in Horticulture.

BEST WIRE, for STRAINED WIRE FENCING, at 9*s.* 6*d.* per bundle of 150 to 160 yards each. Uprights for ditto, 8*d.* each. The Improved continued, and every other kind of Fencing.

Flower-bordering, Trainers, Garden Arches, Flower-stands, Rose-tree Guards, and every description of Ornamental Wire-work, for Gardens, &c.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public, or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:—

Cottam's Patent Boiler, 24 inch		£7	0*s.* 0*d.*
(Larger sizes in proportion.)			
Rogers's Boiler, small size		3	15 0
Do. do. large size		4	10 0

Hot-water Pipe, Doors, Frames, and Feeding Apparatus for Boilers, &c.

Rendle's Tank System on an improved simple plan.

Show-rooms at their Manufactory, No. 2, Winsley-street, where estimates and every information may be obtained.

COTTAM AND HALLEN, AGRICULTURAL IMPLEMENT Makers, &c., 2, Winsley-street, Oxford-street, London.

DOUBLE-MOTION HAYMAKERS, of the best construction, made almost wholly of iron, and containing the double Cylinder, and all the latest improvements, are now ready.

CAST-IRON HAY-RICK stands 2 feet 6 inches high, 5*s.* 9*d.* each, new patterns. Pigtroughs at very low prices.

IRON HURDLES AND FIELD GATES, of all sizes, at exceedingly low prices.

PLOUGHS, DRILLS, Sheep and Cattle Weighing Machines, improved Prize Harrows, Field Rollers, Turnip-cutters, Chaff-cutting Machines, Threshing and Winnowing Machines, Oil-cake Breakers, and every description of Implements used in Agriculture.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where every information may be obtained.

THE CONICAL HOT-WATER BOILERS, invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical; it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine-apple-place; Messrs. Veitch & Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season, particulars of which are in course of preparation.

WIRE-WORK, HOT-WATER APPARATUS, GREENHOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

MANURES.

BOAST AND Co.'s PATENT INORGANIC MANURES. These strong and productive manures have already proved their superiority over all others yet adopted. It is now thoroughly understood and acknowledged by intelligent agriculturists that each plant requires a distinct manure, and it is upon this perfectly scientific principle that these manures are prepared, being formed so as to supply all the substances taken from the soil by each particular crop. They are immeasurably more efficacious, far more economical than all others, and possess the great advantage of being easily applied to the land.

Prospectuses, with full particulars, may be obtained; or will be forwarded by post on application at the Manufactory, Bow, Middlesex.

*** By the use of these Manures, any land may be rendered fertile. Wheat, &c. may be grown on the same land every year with immense advantage to the farmer, and without injury to the soil; whilst all the other crops are greatly increased.

GUANO, superior to the foreign, at a reduced price.

Manures prepared expressly for Gardeners and Florists.

PERUVIAN GUANO, of first quality, and in any quantity, direct from the Bonded Stores. Also African Guano and Nitrate of Soda.—Apply to H. ROUNTHWAITE and Co., 6, Cable-street, St. George's Crescent, Liverpool.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL;

And by their Agents,

COTESWORTH, POWELL, AND PRYOR, LONDON; GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.

47, Lime-street, April 19, 1844.

GUANO ON SALE BY THE IMPORTERS, JOHN BOYD & Co., Wellington Chambers, London-bridge, Borough.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7*s.* per cwt. Phosphate of Potash, 15*s.* per cwt.

" Soda 12*s.* "

" Magnesia 9*s.* "

" Ammonia 1*s.* per lb.

*** Super-phosphate of Lime in a concentrated form may also be procured of Messrs. WARNER, 28, Cornhill, and other Seedsmen, in 7 lb. packets, price 1*s.*

THE URATE of the LONDON MANURE COMPANY, 5*l.* per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

DR. HALLETT'S LIQUID FERTILISER.—The beauty of Flowers, with their power of perfecting their Seeds, and the flavour and size of Fruits and Vegetables, must ever depend upon the food supplied to the plants producing them, and these a very extensive series of trials on various soils has shown, may be secured by the use of Dr. HALLETT'S CONCENTRATED LIQUID FERTILISER, which contains all the essential ingredients of the best foreign Guano, with others equally so, but not to be found by Sea Fowl, in the Atlantic Ocean. Sold at Mr. G. HALLETT'S, Factory, Broad Wall, Blackfriars; Messrs. WINSTANLEY'S, Chemists, 7, Poultry; Messrs. WARNERS, 28, Cornhill; Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street; N. and M. GODWIN'S 41, Ludgate-street; and every respectable Chemist's and Seedsman's, with directions, in stone quarts, at 1*s.* 6*d.* each, and in bottles, six times the size, at 7*s.* 6*d.* The quart requires 32 gallons of water to reduce it for use, for watering soils and growing bulbs in.

GLASS SUPERSEDED for HORTICULTURAL PURPOSES by WHITNEY'S CHEMICAL TRANSPARENT WATERPROOF COMPOSITION, rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to rain or moisture, admitting light equal to Glass, much warmer, and the plants never burn under it.

Noblemen, Gentlemen, and Gardeners will, by using this composition, have the only effectual protection for their Fruit-trees during the blooming season; it is a certain defence from frost, sleet, wind, and blight; its transparency admits the general beams of the sun, with abundance of light, which causes the bloom to expand with increased luxuriance, the fruit to set and swell more freely, much earlier, and a crop of fruit to any extent may be warranted. The covering not to be moved by day (except to thin the Fruit, which will be necessary), till the month of June. It is recommended that the Calico be prepared early, so as to be thoroughly dry before using.

Sold in Bottles, with directions for use, pints, 2*s.* 6*d.*, quarts, 4*s.* 6*d.* each. One pint is sufficient to coat four Frames twice over, each Frame to be 5 ft. by 3 ft. 3 in., or thereabouts. Prepared by GEORGE WHITNEY, Chemist, Shrewsbury. Seedsmen, Florists, and Merchants supplied by Mr. W. BAILEY, Chemist, North-street, Wolverhampton. Appointed Agents:—Messrs. BUTLER and MUCKLEY, Covent Garden, where a sample of prepared calico may be seen; Mr. WATKINSON, Market-place, Manchester; PAGE and SON, Southampton; T. and C. WHALLEY, Nurserymen, Liverpool.

Agents wanted for London and the country.

THE NEW CHEMICAL MANURE.

HUMPHREYS'S FARMERS' COMPOUND, *stronger than Guano, and without its caustic rankness.* Samples on view at the Royal Polytechnic Institution. On Sale with the following Agents:—THOMAS GIBBS and Co., by appointment Seedsmen to the Royal Agricultural Society of England—corner of Half Moon-street, Piccadilly; COTTAM and HALLEN, Agricultural Repository, Winsley-street, Oxford-street; BURCHFIELD, Smithfield; BATT and RUTLEY, 412, Strand; CLARK, Bishopsgate-street; CHARLWOOD, Tavistock-row, Covent Garden; FLANAGAN and SON, Mansion-house-street; BUTLER, Covent Garden; FOTHERGILL, 40, Upper Thames-street; HURST and MCMULLEN, Leadenhall-street; LOCKHART, Cheapside; WILLIAM and JOHN NOBLE, Fleet-street; W. J. NUTTING, Cheapside; WEDLAKE, Fenchurch-street; SAMUEL HOWARD, 38, Mark-lane; WHITE, Phœnix Wharf, Blackfriars; ALLEN, Shrewsbury; COPERMAN and Co., Wells, Norfolk; DICKSON and Co., Edinburgh; T. S. KING, Rochester; W. F. MOLESWORTH, Banbury; W. MADDOCK, Tunbridge Wells; W. E. RENDLE, Plymouth; THOMSON and Co., Macduff, near Banff; THOMAS WATKINSON, Market place, Manchester. Price 12*s.* per cwt.—DAVY, MACKMURDO, and Co., Manufacturing Chemists, 100, Upper Thames-street, London.

IMPORTANT TO AGRICULTURISTS AND OTHERS.

ANALYSES OF SOILS, MANURES, &c. are conducted by MR. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, A., Hawley Road, Kentish Town.

N.B. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.

YORKSHIRE LAND-DRAINING ASSOCIATION

Capital, 500,000*l.*, in stock of 25*l.*—Deposit, 5 per cent.

PATRONS.—The Right Hon. Lord Beaumont.
The Right Hon. Lord Viscount Morpeth.
Sir William M. Milner, Bart.
Edward Stillingfleet Cayley, Esq., M.P.

PROVISIONAL COMMITTEE.

Mr. William Tuke, Bradford.

With power to add to their number.

BANKERS.—The York City and County Banking Company.

STANDING COUNSEL.—H. Bellenden Ker, Esq., Lincoln's-inn.

DRAINING ENGINEER.—James Smith, Esq. (Deanston.)

SOLICITORS.—Messrs. Blanchard, Richardson, and Gutch, York.

SECRETARY.—John H. Charnock, Esq., Wakefield.

This Association is formed for the purpose of affording to the Agricultural Interest, by means of its collective capital, the funds necessary for the THOROUGH DRAINING OF LAND; and of executing and superintending the execution of the works required for this purpose on the most economical and effective principles—repayment of the money advanced to be made, with interest, by such equitable half-yearly instalments as in the several cases may be determined.

Among the various objects to which of late years collective capital has been more or less successfully applied, it is not a little surprising that the one which, of all others, offers the most certain and profitable return, with the soundest security, should have hitherto been almost disregarded. The time, however, has arrived, when an urgent desire for Agricultural improvement on the one hand, and a dearth of safe and profitable investment for superabundant capital on the other, renders such an Association highly desirable to both the landed and monied interest, whilst to the community generally an almost incalculable advantage will be secured by a proportionate increase of labour and food.

At a meeting of the council of the Yorkshire Agricultural Society, held in York, on the 20th of December, 1843, a resolution was passed, approving generally of the objects of this Association, and at the monthly meeting of the Wakefield Farmers' Club held on the 5th January, 1844, a resolution approving of the principle and objects of the Association, was unanimously adopted.

At the meeting of the Royal Agricultural Society of England, at Liverpool, in July, 1841, Lord Stanley remarked—that "there was no bank in the whole country—no commercial speculation—no investment so safe, so sure and profitable, as that in which even borowed capital may be engaged, by investing it under the ground of your own soil." And in reference to this Association, his Lordship, in a letter to the Committee says:—"I am fully satisfied of the benefits which such an Association is capable of conferring on the country, if confined to its legitimate object—the lending of capital on the security of an investment in draining; and I think it very probable that many landed proprietors would avail themselves of the facilities afforded by an institution lending money on land, repayable by instalments—a condition on which few private parties are willing to lend.

Bearing in mind the important objects of the Association, and the perfect security with which its operations can be conducted, at a comparatively trifling expense (no large expenditure for previous outfit being required), it may be reasonably expected that the return for the capital embarked will be such as to insure the support of prudent and permanent investors, thereby divesting it of that speculative character which has stigmatised so many modern projects, and which it is the especial desire of the Committee to avoid.

Application for prospectuses, and further particulars to be addressed to the Solicitors, Messrs. BLANCHARD, RICHARDSON, and GUTCH, York; or to J. H. CHARNOCK, Esq., the Secretary, Wakefield.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1s. An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

BEE-HIVES.—GEORGE NEIGHBOUR & SON beg to inform their Apiarian friends that they have prepared for the season a large supply of "Nutt's Patent Bee-hives" (for the sale of which they are the only authorised agents), in which are embodied all the recent improvements. Their selection now comprehends most varieties in general use at the present time, including the "Single Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with glasses, &c., from either of which the produce may be taken at any time of the gathering season, without destroying the Bees.

G. N. & SON have also Glass Hives, and other articles connected with Bee management, a catalogue of which, with drawings, may be obtained. Letters of inquiry must have postage stamps inclosed.—Apiarian Depot and Honey Warehouse, 127, High Holborn, London.

NUTT ON BEES, Fifth Edition, now Published.

BULB CUCUMBER-GLASSES, for Watering by Evaporation during the growth of the Fruit, 2s. 6d. to 3s. 6d. each; GRAPE-GLASSES, with holes, 1s. 9d to 2s. 6d. each; BEE-GLASSES, 1s. to 2s. 6d. each. Cylindrical CUCUMBER-TUBES, from 6d. to 4s. each; PROPAGATING-GLASSES, Green, 1s. per lb.; white, 1s. 2d. per lb.; or 2s. 6d. to 24s. per dozen; FISH-BOWLS, from 1s. 6d. each; ditto, with hole in the bottom for Fountains, 2s. 6d. per lb., at APSLEY PELLATT'S Falcon Glass Works, Holland-street, Blackfriars. Orders from the country, accompanied with a Post-office order, will meet with prompt attention.

NEW GARDEN NET, 1½d. per yard, second-hand do. ¾d. per yard, quite perfect; Garden Net, ½ inch mesh, warranted to protect the blossom, 2½d. per yard; a fibrous Hemp Net, New Hemp Net, 36 meshes to an inch, 7½d. per yard; Worsted and Woollen Nets, Net to fence out Hares and Rabbits, 2d. per yard, tarred; Tarpauling Frame Pit and Greenhouse Covers, 1s. per square yard; Long Hare and Rabbit Nets on Cords, 50, 80, and 100 yards long. Upwards of 1000 London Policemen's Capes, 2s. and 2s. 6d. each, for Labourers, Gardeners, and Farm-servants. Flags, Banners, &c.

TO FARMERS.—Sheep Net nearly 4 feet high, 4½d. per yard, of strong cord; Rick Cloths dressed with a pliable composition of Tar and boiled Oil, which never mildew or are touched by vermin, as follows:—for 30 tons of Hay, 30 feet by 30 feet, 5l.; 40 tons, 36 feet by 30 feet, 6l. 10s.; 50 tons, 36 feet by 36 feet, 7l. 10s. complete with side-lines. Early orders are respectfully solicited for these Rick-cloths, to prevent disappointment. Dressed Wagon and Hay Cart Cloths. Expanding Tents (the only maker) for Lawns, &c., 36 feet round, 6 feet high in the lowest part, 5l.; 42 feet round, 6l. 10s.; 24 feet round, 4l, put up or down in a few minutes, and require no side-lines. Fishing-Nets of all kinds. Nets to cover in Pheasants, Poultry, &c., 2d. per yard. Nets made to order. ROBERT RICHARDSON, Net, Tent, and Rick Cloth Maker, 21, Tonbride-place, New-road, corner of Judd-street, London.

THE BEST ENGLISH WATCHES.—A. B. SAVORY and SONS, Watchmakers, 9, Cornhill, London, opposite the Bank, request the attention of purchasers to their stock of London-made PATENT LEVER WATCHES, which are manufactured by themselves, in their own house. In silver cases, with the detached escapement and jewelled, the prices are four and a half guineas, six, and eight guineas each; or in gold cases, 10, 12, 14, and 16 guineas each. The very large stock offered for selection includes every description, enabling a customer to select that which is more particularly adapted to his own use.

THIS DAY IS PUBLISHED, PRICE SIXPENCE, STAMPED TO GO FREE BY POST,

The FIRST NUMBER of

The Railway Chronicle.

JOURNAL OF ENGINEERING IMPROVEMENTS, MECHANICAL INVENTIONS, PUBLIC WORKS, &c.

THERE HAS BEEN CREATED within the last ten years a PRODUCTIVE PROPERTY IN RAILWAYS amounting to more than SIXTY MILLIONS sterling, with a REVENUE of nearly SIX MILLIONS PER ANNUM. This addition to the wealth and resources of England has been produced by the investment of the funds of nearly Fifty Thousand Individuals, who form the Railway Constituency of Great Britain. It affords employment to a great body of our Workmen, tends to the development of our industrial Capabilities, and is a boon to the whole travelling Population.

It is strongly felt that Railway property, involving interests so extensive, should not be exposed to the injurious effects which the want of sound information and the circulation of erroneous statements for party purposes so constantly produce; and it has appeared, to those most capable of judging, that the mutual interests of the Proprietary, the Managers, and the Railway Executive, and the Public interests with which they are identified, have as yet found *no* organ in which they can be fairly discussed and satisfactorily adjusted. The Railway Chronicle has been projected to supply this deficiency, by THE ESTABLISHMENT OF AN AUTHENTIC AND IMPARTIAL MEDIUM OF COMMUNICATION BETWEEN ALL THE MEMBERS OF THE GREAT RAILWAY COMMUNITY; having especially in view the free communication of useful information, the promotion of the common interests and the general circulation of sound intelligence in all that relates to Railway property.

The Conductors of the Railway Chronicle are men of practical experience, who possess peculiar facilities for obtaining the earliest information, and who will use their anxious endeavours to advance, in every way, the great interests of Railway property, avoiding all indulgence of personal feeling, the expression of party prejudice, or the advancement of exclusive interests;—they desire, in short, to furnish an unbiassed Chronicle of facts, and a fair arena for the discussion of important opinions and principles.

The Railway Chronicle will contain the earliest and most authentic information on the following subjects:—

THE CONDITION AND PROSPECTS OF RAILWAYS NOW IN USE.
POSITION, PROGRESS, AND VALUE OF FOREIGN RAILWAYS.
PROGRESS OF RAILWAYS IN EXECUTION.
PROJECTED NEW RAILWAYS.
THE TRAFFIC AND REVENUE OF RAILWAYS.
THE ECONOMY OF WORKING AND EXPENDITURE.
THE VALUE OF SHARES.
PAYMENT OF CALLS, DIVIDENDS, AND DEBENTURES.
THE PROCEEDINGS AT RAILWAY MEETINGS, WITH THE DOCUMENTS LAID BEFORE SUCH MEETINGS.
WEEKLY REPORTS ON THE MONEY AND SHARE MARKETS.
THE PROCEEDINGS OF THE BOARD OF TRADE AND OTHER PUBLIC OR MUNICIPAL BODIES, SO FAR AS THEY AFFECT THE INTERESTS OF RAILWAY PROPERTY.
PARLIAMENTARY RAILWAY PROCEEDINGS.
RAILWAY LEGAL INFORMATION.
CONTRACTS FOR EXECUTION OF WORK.
STATE OF THE IRON TRADE.
ENGINEERING WORKS OF MERIT ON RAILWAYS AT HOME AND ABROAD.
ENGINEERING IMPROVEMENTS ON RAILWAYS AT HOME AND ABROAD.
MECHANICAL INVENTIONS RELATING TO RAILWAYS AT HOME AND ABROAD, ILLUSTRATED, WHEN REQUISITE, BY WOOD-CUTS.
LOCOMOTIVE IMPROVEMENTS AND INVENTIONS AT HOME AND ABROAD.
REPORTS OF THE SCIENTIFIC SOCIETIES, WHENEVER ANY SUBJECTS AFFECTING RAILWAYS ARE DISCUSSED.
RAILWAY LITERATURE.
RAILWAY PATENTS.

To eludicate which, Illustrative Maps and Engravings will be given, when necessary.

Arrangements have been made for the purpose of supplying in the Railway Chronicle the earliest information concerning the FRENCH RAILWAYS (*the figures being in English money*), in which so much British capital is now invested, and the other Railways on the Continent which are in progress or in prospect. Intelligence will leave Paris every week in time for insertion in the Railway Chronicle, which will thus contain the transactions in the Paris Railway Stocks, and receipts of the various lines up to the latest hour, and furnish the earliest notice of whatever may affect the British holder.

Weekly Reports from the London, Liverpool, Manchester, and Northern Share Markets will afford the Capitalist the means of judging of the condition of Railway investments.

Another peculiar feature of the Railway Chronicle is to consist in a series of papers on each of the Great British Railways—in which the Past History, Present Condition, and Future Prospects of every Railway will be concisely developed. It is hardly to be presumed, that the great number of persons who have of late years begun to interest themselves in Railway Property, can have had the leisure and opportunity necessary to understand the peculiar circumstances and character of each individual Railway, so as to estimate properly the relative value and prospective profit of these investments. This information will be given in the successive Numbers of the Railway Chronicle. For those who are now becoming subscribers for the first time to a Railway Paper, this feature is important, as it will enable them rapidly to obtain an acquaintance with the whole of the existing lines.

TO CAPITALISTS, BANKERS, SOLICITORS, STOCK-BROKERS, INSURANCE COMPANIES, and all who hold Money for investment, the Railway Chronicle will furnish such sound unprejudiced information as shall enable them at once to make a judicious choice for the investment of funds at their disposal.

TO ENGINEERS, the Railway Chronicle will afford information on all points of Practical Engineering that may tend to the advancement of the profession, and to the perfection of that Railway communication which their talents have placed in its present admirable condition, and which it remains for their skill to render more available to the Public, and therefore more beneficial to the Shareholder. Through this channel of intercommunication every intelligent person will have an opportunity of contributing to the common stock of knowledge, and consequently to the general welfare.

TO CONTRACTORS, MANUFACTURERS, INVENTORS, and PRACTICAL ENGINEERS and MECHANICS, the Railway Chronicle will afford the means of bringing before the Influential Part of the Railway Proprietary, such Inventions, Discoveries, Practical Works, Mechanical Improvements and Articles of Manufacture, as they may desire to introduce into Railway employment; and it will afford the means of ascertaining where their practical assistance can be required either on lines projected or in execution. Thus the columns of the Railway Chronicle will open a market for the labour of the Contractor, the inventions of the Mechanist, and the commodities of the Manufacturing Engineer.

The Railway Chronicle

Will be published EVERY SATURDAY, in time for the Morning Mails.

Orders received by all Newsmen.

Office for Advertisements and Communications, 14, Wellington-street North, Strand, London.

WORKS OF UNIVERSAL UTILITY,

PRINTED FOR

LONGMAN, BROWN, GREEN, & LONGMANS.

1.

Thomas Dakeyne, Esq.
Giles Redmayne, Esq.
James Spicer, Esq.
Henry Sterry, Esq.
Thomas Bax, Esq.
Joseph Cooper, Esq.
Russell Jeffrey, Esq.
William R. Spicer, Esq.
Joseph Sterry, jun., Esq.
Robert Wilcoxon, Esq.

Bankers.—Messrs. Prescott, Grote, and Co.

ADVANTAGES.

A BONUS of two-thirds of the Profits allotted to the Assured.
LOWER RATES OF PREMIUM charged for Assurances without profits.
PREMIUMS payable Annually, Half-yearly, or Quarterly.
ASSURANCES OF EVERY DESCRIPTION may be effected.
Among others, the important one, *originated by this Society*, of securing a sum to the Assured himself on his attaining any given age, or to his family *in the event of his earlier death.*
A POCKET DIARY containing detailed particulars, may be had on application at the Office, or of the Society's agents.

Jenkin Jones, Actuary and Secretary.

ARGUS LIFE ASSURANCE COMPANY, No. 39, Throgmorton-street, Bank.

Empowered by special Act of Parliament, 5 & 6 W. IV., c. 76.

Thomas Farncomb, Esq., Alderman, *Chairman.*
William Leaf, Esq., *Deputy-Chairman.*

Richard E. Arden, Esq.
William Banbury, Esq.
Edward Bates, Esq.
Thomas Camplin, Esq.
James Clift, Esq.
J. Humphery, Esq., M.P.,
Rupert Ingleby, Esq.
Thomas Kelly, Esq., Alderman.
Jeremiah Pilcher, Esq.
Lewis Pocock, Esq.

Physician—Dr. Jeafferson, 2, Finsbury-square.
Surgeon—W. Coulson, Esq., 2, Frederick's place, Old Jewry.
Consulting Actuary—Professor Hall, of King's College.

Advantages of the Argus Life Assurance Company.
Low Rates of Premiums.

In addition to the subscribed capital of 300,000*l.*, the Assured have the security of the Company's Income of nearly 60,000*l.* per annum, yearly increasing, and accumulating Assurance Fund invested in Government and other available Securities, of considerably larger amount than the estimated liabilities of the Company. The Rates of Premium are reduced to the lowest scale compatible with the safety of the Assured and the stability of the Company, thereby in effect giving to every Policy-holder an immediate and certain bonus without risk, in lieu of the deferred and frequently delusive prospect of a periodical division of profits.

Annual Premium to assure £100.

Age.	For One Year.	For Seven Years.	Whole Term.
20	£0 17 8	£0 19 1	£1 11 10
30	1 1 8	1 3 7	2 0 7
40	1 5 0	1 6 9	2 14 10
50	1 14 1	1 19 10	4 0 11
60	3 2 4	3 17 0	6 0 10

One-third of the whole-term Premiums may remain unpaid at 5 per cent. comp. int. as a debt upon the policy for life, or may be paid off at any time without notice.

In Assurances for advances of money as security for debts, or as a provision for a family, when the least present outlay is desirable, the varied and comprehensive Tables of the Argus Office will be found to be particularly favourable to the Assured.

A Board of Directors, with the Medical Officers, attend daily, at a quarter before 2 o'clock.

EDWARD BATES, Resident Director.

A Liberal Commission to Solicitors and Agents.

The next division of profits will be made in November, 1847.

Members whose Renewal Premiums became due the 1*st instant*, are reminded that the same must be paid within 30 *days* from that time.

London, 19th April, 1844. Joseph Marsh, Secretary.

New Edition, price 25*s.* each vol.

DR. LINDLEY'S LADIES' BOTANY, in 2 vols. 8vo, each containing 50 beautifully coloured Plates.

2. DR. LINDLEY'S BOTANICAL REGISTER, published Monthly, price 3*s.* 6*d.* each No., beautifully coloured. The vol. for 1843, bound in cloth, price 2*l.* 4*s.*, is now ready.

3. DR. LINDLEY'S SPLENDID WORK on ORCHIDACEOUS PLANTS is now complete in Ten Parts, price 25*s.* each.

4. A New Edition of SWEET'S HORTUS BRITANNICUS, or Catalogue of Plants. Edited by Don. Price 21*s.*, bound in cloth.

5. SWEET'S BOTANICAL CULTIVATOR. Price 16*s.*, bound in cloth.—James Ridgway, Piccadilly; and all Booksellers.

New Edition, now ready, price 16*s.* bound in cloth,

MANURES. By C. W. Johnson, Esq., F.R.S., &c. brought down to the present time, and giving the fullest and most authentic information on every kind. Also, by the same Author, TRACTS for the Use of AGRICULTURAL SCHOOLS, price 1*s.* each. On Agricultural Chemistry—The Young Farmer's Calendar; and the Cottage Farmer's Assistant, containing Cottage Cookery, &c.

James Ridgway, Piccadilly.

Also—1. A Fourth Edition of MORTON on SOILS; with the Two Reports of Whitfield Example Farm. Price 10*s.*

2. A New Edition of SINCLAIR on GRASSES. Price 30*s.* coloured plates.

NOW READY, price 1*s.*

PERUVIAN and BOLIVIAN GUANO, with Full Practical Instructions for its Use, and Testimonials of its Properties and Results.—Jas. Ridgway, Piccadilly, and every Country Bookseller. Also,

1. The Fourth Edition, enlarged, of Morton on Soils, price 10*s.*
2. Agricultural Chemistry for the Practical Farmer, by C. Squarey, 5*s.*
3. A New Edition of "Sinclair on Grasses." Coloured plates, price 30*s.*

NOW BEING PUBLISHED.

Large, 1*s.* 6*d.*; Small, 1*s.*; Gardeners' Edition. 6*d.* THE BOTANIC GARDEN; or, MAGAZINE of FLOWERING PLANTS.

With many important and useful additions.

By B. MAUND, F.L.S.

Each Number contains Beautifully-coloured Figures of Ornamental Plants, both herbaceous and shrubby, suitable for the Flower-Garden or Pleasure-Ground. With the derivations of names, classes, orders, height of the plants, time of flowering, native country, history, qualities, most approved modes of propagation and culture; and other information, interesting to every lover of a Garden. Annexed to each Number is the

FLORAL REGISTER,

With Woodcuts of admired Flowering Plants, mostly such as have been newly imported into this country; with the necessary information respecting them. Also,

THE AUCTARIUM,

in which are given, improved methods of cultivation of vegetables, fruits, and flowers; new discoveries connected with gardening, and the power of new manures; and miscellaneous information. Also, in each Number, till complete, a portion of Prof. Henslow's

BOTANICAL DICTIONARY,

With numerous Explanatory Woodcuts, and Explanations of the English and Latin words in use, written expressly for the Author. Thus the "Botanic Garden" contains Four distinct Works, proceeding together, at a trifling cost, once a month.

No. XVI. of THE GARDENER'S EDITION, at 6*d.*, with partially-coloured plates, was published on 1st April.

The portions of the Floral Register and Auctarium already published contain nearly Twelve Hundred Engravings, forming one handsome volume, which will be delivered Gratis to the purchasers of four volumes of the Botanic Garden.

Groombridge, Paternoster-row.

HOOKER'S BRITISH FLORA.

Just published, 8vo, with 12 Plates, 14*s.* plain; with the plates coloured, 24*s.*, cloth,

THE BRITISH FLORA, Vol. I.; comprising Phænogamous, or Flowering Plants, and the Ferns. By Sir William Jackson Hooker, K.H.LL.D.F.R.A. and L.S. &c. &c. &c. Fifth Edition, with Additions and Corrections; and 173 Figures illustrative of the Umbelliferous Plants, the Composite Plants, the Grasses, and the Ferns. In Two Vols. Vol. 2, in Two Parts, completing the British Flora, 24*s.* boards.

London: Longman, Brown, Green, and Longmans.

NEW WORK ON ORNITHOLOGY.

On Tuesday, April 30th, will be published, in imperial 4to, with Four coloured and Three plain Plates, 10*s.* 6*d.*, Part I. of

THE GENERA of BIRDS. By George Robert Gray, Senior Assistant of the Zoological Department in the British Museum. Illustrated with about Three Hundred and Fifty Plates, by David William Mitchell, B.A. F.L.S. &c.

*** To be completed in (not exceeding) Fifty Monthly Parts, 10*s.* 6*d.* each.

London: Longman, Brown, Green, and Longmans.

This day is published, fcap. 8vo, 3*s.* 6*d.*,

THE ECONOMY of WASTE MANURES; a Treatise on the Nature and Use of neglected Fertilisers. By John Hannam. Written for the Yorkshire Agricultural Society, and published by permission of the Council.

"Mr. Hannam's excellent Treatise on Waste Manures points out the great loss of Manure going on on almost every farm, and it gives directions which will be found extremely useful for the preservation of all kinds of manures in their most effective state."—*Address of the Council of the Yorkshire Agric. Soc.*

London: Longman, Brown, Green, and Longmans.

FLORA ODORATA; a Characteristic Arrangement of the Sweet-scented Flowers and Shrubs cultivated in the Gardens of Great Britain; with Practical Directions for their Selection, Propagation, and General Management. By Frederick T. Mott. Price 3*s.*

"The idea is a happy one, and we have no doubt it will meet with success."—*Gardeners' Chronicle.*

"We venture to predict for this work an extended circulation, and no small share of popular favour; there is a practical character pervading it which, in our opinion, must constitute its passport to general acceptance."—*Nottingham Mercury.*

"This Work has four great merits—utility, brevity, elegance, and cheapness."—*Essex Mercury.*

Orr and Co., and Houlston and Stoneman, Paternoster-row, London; and Brown and Hewett, Leicester.

BEES.

Second Edition, Enlarged, and with additional Illustrations, price 4*s.*,

THE BEE-KEEPERS' MANUAL; or, Practical Hints on the Management and Complete Preservation of the Honey-Bee. By Henry Taylor.

Also, in Two Vols., handsomely bound, price 18*s.*, THE GARDENER AND PRACTICAL FLORIST.

London: R. Groombridge, 5, Paternoster-row.

In 12mo (with woodcuts), price 3*s.* 6*d.*,

SHORT and SIMPLE LETTERS to COTTAGERS.

Contents:—1. The Village. 2. The Village School, Part I. (To Children.) 3. The Village School, Part II. (To Parents.) 4. The Village School, Part III. (To School-Masters and Mistresses.) 5. Mary Thompson's Cottage Walls. 6. On Bee Management. 7. On the Natural Theology of Bees. By the Rev. W. C. Cotton, M.A., Student of Christ Church, and Author of "My Bee Book."

Rivingtons, St. Paul's Church-yard and Waterloo-place.

*** These Tracts may be had separately, price 6*d.* each.

Now ready, price 1*s.*, the April Number of

THE ZOOLOGIST: a Popular (Monthly) Journal for recording (after the manner of the Rev. Gilbert White, of Selborne) original observations relating to the instincts, habits, food, retreats, migrations, nests, and young of animals. The papers are by Sir Oswald Mosley, Bart., Rev. J. C. Atkinson, Rev. C. A. Bury, Rev. G. Gordon, Rev. W. S. Hore, J. H. Gurney, Esq., &c.

John Van Voorst, 1, Paternoster-row.

LINDLEY'S ELEMENTS OF BOTANY.

1 vol. 8vo, with many hundred figures on wood, 10*s.* 6*d.*, cloth.

ELEMENTS of BOTANY, Structural, Physiological, Systematical, and Medical; being a Fourth Edition of the Outline of the First Principles of Botany. By John Lindley, Ph. D. Professor of Botany in University College, London.

LIEBIG'S AGRICULTURAL CHEMISTRY. Third Edition. 8vo, 10*s.* 6*d.*

LIEBIG'S ANIMAL CHEMISTRY. Second Edit. 8vo. 9*s.* 6*d.*

LIEBIG'S CHEMICAL LETTERS. Second Edition. Fcap. 8vo. 4*s.* 6*d.*

TURNER'S CHEMISTRY. Seventh Edition. By Professors Liebig and Gregory. 8vo. 11. 8*s.*

Printed for Taylor and Walton, 28, Upper Gower-street.

Just published, Part the Second, price 10*s.*

SPECIES FILICUM, or a Synopsis of all known FERNS. This Second Part contains POLYPODIACEÆ continued, and Plates XXI. to XL. By Sir William Jackson Hooker, K.H., L.L.D., F.R.S., &c.

*** It is intended to publish Part the Third in July.

William Pamplin, 45, Frith-street, Soho-square.

THE LIBRARY OF TRAVEL.

To be continued weekly, price 4*d.*, the Fourth Number of

THE LIBRARY of TRAVEL; being a Popular Description of Foreign Countries, with Notices of Scenery, National Characteristics, Incidents of Wayfaring and Sojourn, Personal and Historical Sketches, Anecdotes, &c.—Abundantly Illustrated with Wood Engravings.—Edited by Walter K. Kelly.

Each Weekly Number will contain 20 full pages of letterpress, demy octavo, embracing such woodcuts as may be required to illustrate the text.—Syria and the Holy Land will form the First Volume.

London: Chapman and Hall, 186, Strand. Orders received by all Booksellers.

This day is published, price 1*s.* sewed, No. XXXV. of

THE PHYTOLOGIST; a Popular Botanical Journal, on the plan of The Zoologist. The Contributions to this Number are by Edward Forster, Esq., V.P.L.S., Dr. Boott, F.L.S., W. Wilson, Esq., Dr. Bell Salter, G. Luxford, A.L.S., &c.

John Van Voorst, 1, Paternoster-row.

Under the Patronage of their Royal Highnesses Prince Albert and the Duke of Cambridge, and a large portion of the Nobility, Gentry, and Agriculturists of the United Kingdom.

Now publishing, price 10*s.*, illustrated by 5 Plans,

THE PRACTICAL DRAINAGE OF LAND OF ALL DESCRIPTIONS.

By Henry Hutchinson, Land Agent, Valuer, and Professor of Draining, Walcot, near Stamford.

London: Houlston and Stoneman, 65, Paternoster-row; Henry Johnson, St. Mary's Hill, Stamford, and may be had of all Booksellers.

Just published, in one volume royal octavo,

THE VALUE OF LANDED PROPERTY demonstrated, and the Equitable Rent exhibited, of every description and quality of land as applicable to the purposes of Agriculture. By Layton Cooke, Estate Agent and Surveyor.

Published by the Author, at No. 7, John-street, Adelphi; and Simpkin and Marshall, Stationers'-Court, London.

Just Published, price 1*s.*,

A PRIZE ESSAY ON MANURES, containing several valuable Reports of Experiments. By George Thompson, Author of "Practice and Science," "The Packet Examined," &c. &c.; Member of the Royal Agricultural Society of England.—London: Simpkin, Marshall, and Co.

AGRICULTURE.—LIEBIG.—THE LANCET.—No. 5, ENLARGED FORM, published THIS DAY, price SIXPENCE; stamped, SEVENPENCE. John Churchill, Publisher. Agents: all Booksellers and Newsvendors.

No. 6 of the Enlarged Form of THE LANCET, with a LECTURE by LIEBIG, on SATURDAY next.

RAMS FOR RAISING WATER WITHOUT LABOUR, WHERE A FALL CAN BE OBTAINED,

FOUNTAINS of every description. Specimens of the Fountain to be seen at the above address.

Also a Ram fixed on the premises. F. ROE, 70, Strand, London.

Every kind of Garden and other Pumps, Well Engines, &c.

100 CUCUMBER AND MELON BOXES AND LIGHTS for Sale. One, Two, and Three-light Boxes and Lights of all sizes ready for immediate use—best materials: packed and sent to all parts of the Kingdom by James Watts, Sash Manufacturer and Hothouse Builder, Claremont-place, Old Kent-road. Garden Lights glazed and painted complete, from 1*s.* per foot.

News of the Week.

The affairs of Tahiti have been again brought prominently before the French Chambers, by the arrival of fresh despatches from Admiral Dupetit Thouars. It appears that these documents refer to certain reports from inferior officers, which were in the possession of Ministers during the great debate on the same subject a few weeks ago, but were not submitted to the Chambers. The Cabinet justify themselves on the ground that no Government is obliged to communicate all the documents applied for, and especially the reports of subaltern officers to their superior. The Opposition, however, are by no means satisfied with this explanation, and are still further excited by the new despatches from the Admiral, in which the conduct of our own officers at Tahiti is made the cause of all the troubles in the Pacific. Angry discussions have taken place in both Chambers, and a coalition of all the sections of the Opposition has been formed for the purpose of overthrowing the Ministry, if possible, on this point. The papers, of course, discuss the question with strongly national feelings, and make it the

ground of fresh attacks upon England. The Ministry, however, are said to be very easy as to the result; and it is generally believed that they will obtain a majority as decisive as that which defeated the strong combination formed against them a few weeks since.—From Spain we have no news of any consequence, but from Portugal we learn that the late accounts of the suppression of the revolt at Almeida were altogether premature. The Government blockade has hitherto been useless, and the fortress still remains in the hands of Count Bomfim and his military followers. Serious disaffection prevails throughout the kingdom, and so uncertain is the result that the insurgent leader is not unlikely to supplant the Ministry of S. Costa Cabral.—The accounts from Italy are still contradictory; it is believed that Sicily is in a state of revolt, and that the promoters of the insurrection are now at Malta, maturing their plans and arranging their future operations.—The King of Greece has ratified the new Constitution by the prescribed oaths, and the National Assembly has been closed after bringing their arduous and important labours to a successful issue.—The Texas and Oregon questions are the leading topics in the news from the United States, and it is currently reported in New York that the British Ambassador is instructed to give up the Oregon, on condition of his obtaining a modification of the tariff.

At home, Parliament has again assembled after the Easter recess, but the business transacted does not call for further notice than will be found in our report.—In Dublin on Monday, Mr. O'Connell and the other traversers received notice that judgment would be applied for on the verdict, unless cause to the contrary be shown within four days. This was met by a counter-notice announcing that the traversers intend to apply for a new trial, and the arguments on this point are appointed to commence on Monday.

Home News.

COURT.—Her Majesty and Prince Albert, accompanied by the Queen of the Belgians, the Prince of Leiningen, the Prince of Wales, the Princess Royal, and the Princess Alice, arrived in town on Tuesday from Windsor, and the King of the Belgians arrived on the same evening from Claremont. On Wednesday the Queen held a Court and Privy Council at Buckingham Palace, at which Sir F. Pollock, the new Chief Baron of the Exchequer, and Mr. Hope, Lord Justice Clerk of Scotland, were sworn as Privy Councillors. On Thursday, Her Majesty held her second Drawing-room this season, which was very numerously attended. Her Majesty has signified her intention to give a series of state balls at Buckingham Palace during the present season. The statement that Eaglehurst Castle has been selected as a marine residence for the Royal infants has been contradicted.—The Queen Dowager has arrived in town from Bushy Park, and continues in improved health. The American dwarf, General Tom Thumb, attended on Monday at Marlborough House, the residence of the Queen Dowager, for the second time. The Duchess of Gloucester and the Duke of Cambridge were also present. Her Majesty presented the General with a gold watch, which was manufactured by command of the Queen Dowager, and is of the smallest size.

Parliamentary Movements.—Mr. Hurst, who formerly contested the borough on the Whig interest, has come forward as a candidate for Horsham, the late member, Mr. Scarlett, having succeeded to the peerage; there is no other candidate, and Mr. Hurst will doubtless be returned without opposition.—Mr. Baring, the unsuccessful opponent of Mr. Pattison in the recent contest for London, is the Government candidate for Huntingdon, vacant by the promotion of Sir F. Pollock to the bench.—The representation of Exeter, vacant by the appointment of Sir W. Follett as Solicitor-General, will be contested by Gen. Briggs, who has announced his intention of opposing the re-election of Sir W. Follett on the League interest.—The re-election of Mr. Tnesiger for Woodstock will also be opposed, the Marquess of Blandford having addressed the electors on the Conservative interest.

Law Appointments.—As anticipated in our last, Sir F. Pollock has been appointed Lord Chief Baron of the Exchequer in the room of the late Lord Abinger; Sir W. Follett has been promoted to the office of Attorney-General in the room of Sir F. Pollock: and Mr. Thesiger has been appointed Solicitor-General in the room of Sir W. Follett.

East India House.—At the Court of Directors last week, after the re-election of the retiring Members of the Board, Mr. John Shepherd was chosen Chairman, and Sir Henry Willock, Deputy-Chairman, for the year ensuing.

Foreign.

FRANCE.—Our accounts from Paris state that the utmost sensation and excitement on the subject of Tahiti has been again produced among all classes of people, and is every day gaining additional strength. This subject has been brought thus prominently forward by the arrival of Lieut. Reine, aide-de-camp to Rear-Admiral Dupetit Thouars, who is believed to have conveyed to the French Government various documents relative to the late occurrences at the Society Islands. On Friday an attempt was made in the Chamber of Peers to revive a discussion on the subject. The Prince de la Moscowa put some questions to the Minister of the Navy relative to the contents of these documents, when the latter replied that a report had been received from Rear-Admiral Dupetit Thouars, dated five days later than the despatch announcing that he had taken possession of Otaheite; but that it added nothing whatever to the information which had already come to hand. The Marquis de Bossy insisted on this report being laid on the table, whereupon the Minister replied that the Government would "deliberate" on the point. On Saturday the subject was brought before the Chamber of Deputies by M. Billault, the ally of M. Thiers, after the report of Admiral Dupetit Thouars had been laid before the Chamber by the Ministers; and a most exciting discussion ensued. M. Billault endeavoured to prove that M. Guizot had been guilty of falsehood when, on the Otaheite affair being first discussed, he had affirmed that the Government possessed no other documents on the subject than those they had produced. M. Billault referred to the *Moniteur*, and observed, that, but two days before, the Minister of the Navy had stated, in the Chamber of Peers, that at the time they disavowed Admiral Dupetit Thouars's proceedings, the Cabinet were in possession of the reports of the officers who had commanded at Otaheite during the "protectorate." The Minister of the Navy defended his veracity, and M. Guizot asserted that, at the period mentioned, the Government had only the Admiral's report respecting the special fact of the deposition of Queen Pomaré. M. Dufaure and Odilon Barrot assailed M. Guizot with renewed vigour, the Minister maintaining that the Government were not obliged to communicate all the documents applied for, and especially the reports of subaltern officers to their superior. M. Berryer and M. Marie joined in the attack, and M. Guizot required all his firmness and command of temper to stand the clamour raised against him. Upon M. Ledru-Rollin crying out, "You have failed in sincerity and good faith," the scene became quite a tumultuous one. M. Guizot indignantly repelled the imputation; the Central Deputies demanded that M. Ledru-Rollin be called to order, the President declared that his language was not parliamentary, and M. Ledru-Rollin exclaimed that it was not the less true. Thereupon, the Chamber separated in the greatest agitation, the Opposition threatening to revive the discussion with renewed fury. On Tuesday, M. Billault again brought the affairs of Tahiti forward, stating that he wished to put some interpellations to the Ministry on the subject. M. Cunin Gridaine, who was the only member of the Cabinet then in the House, replied, that the Government was not only ready but anxious to answer all questions in respect to the late affair at Tabiti, and he therefore moved, in the name of the Cabinet, that Friday should be fixed upon for the discussion, which was at once agreed to. The Opposition party are in a state of the utmost excitement and indignation against the Cabinet, for their conduct in the affair. All the different sections of the Opposition have held meetings on the subject, in which they concurred in heaping the most violent abuse upon the Cabinet and M. Guizot. A coalition has been formed between all the parties of the Opposition, in which they have promised to act according to a settled plan. The coalition met for the first time on Monday in one of the bureaux of the Chamber. MM. Thiers, Berryer, Remusat, Odilon Barrot, Billault, and Viviers were present. A suggestion to impeach the members of the Cabinet was seriously brought forward by some of the most violent members of the Opposition, but it was not considered prudent to attempt it. In the meantime, the Cabinet appear very easy as to the result. An equally strong combination was formed against them a few weeks ago, but they carried the day triumphantly, and there is no doubt that on this occasion the result will be similar. The usual supporters of Ministers are staunch in the support of the Cabinet, and declare that nothing has happened since the time when the affairs of Tahiti were formerly discussed and the judgment of the house upon them, which makes it at all necessary that the subject should be recurred to. The Ministry are therefore perfectly satisfied that the majority in their favour now will be fully equal to that which supported them in the former division. In the bureaux of the Chamber of Peers, on Monday, when the Secret Service Money Bill was under consideration, the Ministers were asked several questions as to their intentions respecting the conversion of the Five per Cents.; and so strong was the feeling expressed upon the subject by the Peers, that the Minister of Finance, on the part of the Cabinet, gave a promise that, should nothing occur in the meantime to prevent him from doing so, he would next year introduce a bill for the purpose of reducing the interest on that part of the national debt which now pays 5 per cent. interest. In the same Chamber on Tuesday, the debate on the Secret Service Money was continued, and led again to a discussion on Tahiti. M. de Montalembert, M. de Bouchage, and other Opposition Peers, made violent attacks upon the Government, and M. Guizot replied in a speech of great animation, after which the discussion dropped.—In reference to the cause of all this excitement, it is stated that the report of Adm. Dupetit Thouars is anything but complimentary to the English naval officers in the Pacific. There is said to be another report from Capt. Bruat, which is still stronger, but which the Ministry have thought it right to withhold. It is supposed that it is on account of the violence of the language made use of by Capt. Bruat with regard to England, that the Government refuse to produce the reports of the inferior officers to their superiors, the refusal of which gives so strong a handle to the Opposition. The papers also state that Lieut. Reine who brought the despatches is not allowed by Ministers to hold any communication with his friends, and that the documents which were annexed to the Admiral's report, and which have been kept back, contain details of most serious insults offered to French authority and the French flag at Otaheite. It is also asserted that, if Adm. Hamelin has not yet sailed in order to supersede Adm. Dupetit Thouars in his command, it is because he insists upon previously receiving explicit and formal instructions as to the course he is to pursue—instructions which M. Guizot obstinately denies him.—M. Lafitte, whose election, at Louviers, has been twice annulled by the Chamber of Deputies, was again returned, at the same place, on Saturday, by a majority of 342 to 63. The editors of the *Gazette de France* and *Nation* were sentenced on Saturday by the Court of Assizes of Paris, the first to six months' imprisonment and 3000f. fine, and the other to four months' imprisonment and 6000f. fine, for disputing the right of Louis-Philippe to the throne. The *grippe* (influenza) continued to make painful progress in Paris. Differing from former visitations of the malady, it has this year proved fatal in very many cases. The King had been slightly attacked by it; and M. Duchatel (Minister of the Interior) was on Tuesday seriously ill of it. The daughter of M. Guizot, who had also been attacked, was convalescent. At a meeting of the Chamber of Commerce of Lyons, on the 5th inst., to take into consideration the Bill for the railroad between Paris and Châlons, and the interests therein of Lyons in particular, it came to a resolution to petition the Chamber that the road should be continued to Lyons, either by the State or by companies, and that the two Bills should be both presented and passed this session. It was said in Paris that the influence of the French Government would prevent the marriage of the Duke of Bordeaux with a Neapolitan Princess, believed to be in contemplation.

SPAIN.—The accounts from Madrid chiefly refer to the religious ceremonies of the holy week, which would appear to have been revived with extreme fervour. Another grand procession took place on Good Friday, at which it was observed that General Narvaez, the political chief, Benavides, and the French envoy, M. Bresson, wore the grand cordon of the Legion of Honour. The rumour that M. Bresson was shortly to be invested with the ribbon of Charles III., so soon after his arrival at Madrid, tended further to prove the sympathy existing between the party in power and the French Government. The Ministry had just held another Council, wherein the law or decree to be promulgated relative to the press had been again discussed; and it was affirmed that the *Gazette* will shortly publish the law, with a decree declaring Spain to be no longer in a state of siege. M. Cortina and the other imprisoned members of the Cortes, had, at length, been suffered to communicate with their families and friends. On the 4th they had been visited by a large number of persons. On the other hand, several individuals are stated to have been arrested for having been implicated in the late murderous attempt on the Captain-General Narvaez. A number of deserters, from various regiments, had likewise been seized at Madrid. The Barcelona papers of the 6th are likewise taken up with accounts of the religious solemnities of the day. A brig had just conveyed to Barcelona 352 Catalans, captured at Carthagena. Letters from Perpignan of the 2d inst. state that 15 refugee Carlist officers and soldiers have been recently arrested in the neighbourhood of that town, who were, it is alleged, about to enter Catalonia. The papers mention the occurrence of a frightful catastrophe at Felanitx, in the Balearic Islands. On the 31st ult. a large crowd of people having assembled to hear a sermon in the old cemetery of the village, the wall which separated the churchyard from the Calle Mayor suddenly fell down, and buried under its ruins upwards of 300 persons. The alcalde and six members of the ayuntamiento and the preacher were among the victims. The papers estimate at 600 the sufferers by the accident, 414 of whom were said to have been killed and 191 wounded.

PORTUGAL.—Accounts from Lisbon of the 9th show that, although the Government journals received by the last packet announced the approaching suppression of the revolt, the movement is so far from being put down, that the opinion of most persons at Lisbon is that its only probable result will be the success of Count Bomfim in displacing the Ministry of Costa-Cabral. The Count, up to the latest dates, still maintained himself in Almeida, in spite of the nominal blockade by the Government troops, to whom his garrison was equal in numerical strength, and far superior in supplies both of money and provisions. General Fonte Nova, commanding the besieging force, had commenced the long-threatened bombardment; but, as the battery was situated about an English mile from the walls, it may be supposed that no great effect had been produced by its fire. At Coimbra a portion of the 12th Regiment of the Line, and some men of the Municipal Guard had declared against the Ministry, and though momentarily defeated, after a smart skirmish, succeeded in marching in good order upon Vizeu, where they expected to be joined by reinforcements from other regiments. At St. Michael's, one of the Azores Islands, the 1st Caçadores had joined the revolt, and an impression prevailed that they were about to sail thence in order to make a descent on the coast of Algarve. Such is the actual state of affairs, and it does not augur any very brilliant success for the Government. Other circumstances tend to show either the most capricious tyranny on the part of Costa Cabral, or the great extent of the disaffection. Arrests are of daily occurrence; and several naval and military officers are already in confinement. Guerilla parties were scattered in all directions over the country, one of them numbering as many as 250 men, while another is under the personal command of a well-known member of the Chamber of Peers. General Schwalback, Governor of the Algarves, had been recalled to the capital for the purpose, it was

bered, of superseding Gen. Fonte Nova in the command before Almeida, if indeed the Government should venture on displacing the latter, who was not thought indisposed, in such a case, to join Count Bomfim. In short, the situation of the Government is extremely critical, and the movement is no longer considered an unimportant one.

GERMANY.—It is stated in a letter from Berlin of the 3d, that the Prussian Government contemplates a treaty of commerce with Portugal. The treaty with the United States will, it is supposed, come into operation in July. It is drawn up in English and German, and not in French, as has hitherto been the case with treaties.—We learn from Cologne that the desire to invest capital in the German railroads is so great, that the application for shares of the intended road from Cologne to Crefeld, for which only 2,400,000 Prussian crowns were required, amounted to 52,908,000 crowns; and for the road from Bonn to Coblentz, for which three millions and a half were wanted, the applications amounted to 18 millions.—M. Von Haber is now undergoing his sentence of six months' imprisonment, arising out of the late unfortunate duel with M. Sarachago, in the fortress of Babenhausen.—We learn from Munich that the King of Bavaria has published a decree, in virtue of which Protestant soldiers are to be no longer forced to be present at the service of the Roman Catholic Church, or Catholic soldiers to attend on the occasion of religious ceremonies in Protestant churches. In cases of religious processions, however, they are still to be called upon to form the line, that being considered a service of public order, and not identifying them in any way with the religious character of the proceedings.—Typhus and scarlet fever have been raging with fearful violence for some weeks past at Munich. The schleim fever, a species of influenza, has also made its appearance there, and committed extensive ravages. The Prince of Saxe Altenburgh has lost two of his children, and several other noble families are plunged in similar affliction.

HOLLAND.—A remarkable event has just occurred in this country. For many years after the revolution of 1830, by which Belgium was separated from Holland, the large expenses to which the latter country was subjected, obliged her to have recourse to annual loans. This excess of expenditure was occasioned chiefly by the necessity of providing for the punctual payment of the interest on the public debt, as the whole burden of it fell upon Holland, even for that portion for which Belgium was ultimately to be responsible under the treaty which acknowledged the independence of the latter kingdom. Since the final adjustment of the debt between the two countries, Holland has been seriously occupied with the re-establishment of order in her finances, with the view of making a permanent provision for the annual interest, and also a reduction of her Five per Cents. to a rate more in accordance with the diminished rate of interest which money bears in the country. The chief measure proposed for this object was a property tax; but as that form of taxation was felt by the Government to be objectionable in a country already so much burdened by taxation, it was resolved to make an appeal to the patriotic feelings of the nation, and the capitalists were invited to subscribe voluntarily to a loan of 7,000,000 guilders in a Three per Cent. stock at par, which would furnish the Government with such a sum of money as would enable them to reduce the Five per Cents., and supersede the necessity of a property tax. This appeal has been fully responded to, and the whole amount has been subscribed. Even in Maestricht, and other towns which have been declining ever since the separation from Belgium, almost everybody has contributed, although they would not have been subject to the income tax.

ITALY.—There are no authentic accounts this week of any importance connected with the movement in Italy. The two sons of the Austrian Admiral, Bandiera, were at Malta where S. Mazzini, the chief of Young Italy, was expected from England. Sicily was in a disturbed state, and extraordinary precautions had been taken by Government to prevent an outbreak. The Papal States are also in a precarious state; and it is rumoured that several influential inhabitants of the northern provinces have subscribed a note to the Austrian Ambassador at Rome, demanding that the Legations of Romagna and Montefeltro be united to Tuscany, those provinces engaging to pay to Rome a tribute for the support of the Pope and Cardinals equivalent to the amount of the taxes now imposed upon them. The dispute between Sardinia and Tunis is likely to be arranged under the mediation of England.—The fourth scientific congress is to take place at Milan on the 12th September, instead of the 15th, as originally intended, and will continue for 12 days. The assemblage is expected to be exceedingly numerous, from the number of persons whose names are already announced as intending to be present. The Lombardo-Venetian Government, the Municipality, and the Academy of Science of Milan, are making every preparation to give a brilliant reception to the visitors. Amongst the various amusements which are in contemplation for the occasion are a grand naumachia, and racing according to ancient Roman custom are spoken of, as well as excursions to Monza and Pavia.

GREECE.—Our accounts from Athens come down to the 30th ult. inclusive. On that day King Otho closed in person the session of the National Assembly, to which he delivered the following address:—"I am rejoiced to see the great work of the Constitutional Charter of Greece brought to a close, and I present myself before you in order to seal it by the prescribed oaths. I desire that the Constitution—that sacred and indissoluble tie between the Nation and the King—may produce and consolidate the prosperity of Greece. The task for which I have convoked this National Assembly being finished, I declare it to be closed." The capital was illuminated in the evening.

TURKEY.—Accounts from Constantinople of the 27th ult. state that the concession made by the Porte to the British and French Ambassadors respecting relapsed renegades was considered the most important diplomatic achievement in the annals of Turkey, being the death-blow to Ottoman fanaticism. Hardly had the question been settled, than the Russian Minister addressed a note to the Divan relative to the outrages committed by the Albanians against the Christian population in the district of Iscupe. The Russian diplomatist, it appears, assumed a high tone in his communication, and gave orders to the Captain of the brig of war in attendance on the embassy not to fire the usual salute in honour of the Sultan, as he passed by the ship on the 22d on his way to the mosque. His Highness reviewed, on the 25th, at Scutari, about 15,000 troops of all arms, intended for Albania. Hussein Pasha, the governor of Widdin, and the celebrated destroyer of the Janissaries, had been summoned to Constantinople, in order, it was believed, to take the chief command of the army of operation in Albania. A portion of the fleet had been equipped, and several light vessels ordered to cruise on the coast of Albania, and co-operate with the land forces in restoring peace and tranquillity in the country.

UNITED STATES.—The Royal mail steam-ship Caledonia arrived at Liverpool, on Monday, from Boston and Halifax, which ports she left on the 1st and 4th inst. respectively. The news is chiefly confined to the annexation of Texas and Oregon, and to the reduction of the tariff. Two Texan envoys, Henderson and Van Zandt, had arrived in Washington to conclude a treaty for the annexation of that republic to the United States. This however was supposed to be a scheme got up with electioneering views, and for the purpose of damaging both Mr. Clay and Mr. Van Buren in those states where the absorption of Texas and the Oregon are popular. The friends of Texas assert, with the most perfect confidence, that the American Senate will ratify the treaty; adding, as if by "authority," that, in the event of a refusal to ratify, Texas will immediately cast herself into the arms of Great Britain, where she will be promptly and cordially received. In regard to the Oregon, the subject of its occupation is still discussed with some violence. A general impression prevails that the United States has a title to the territory up to the 49th degree of latitude, and that no proposition which falls short of that degree will be accepted by the people. It was said that Mr. Pakenham was instructed to give up the Oregon on condition of his obtaining a modification of the tariff. General Porter, who had filled some high offices in the State Legislatures, had died at his residence, Niagara Falls, in his 71st year. Advices had been received from Monte Video, twenty days in advance of the previous news, but nothing is stated except that the war between that Republic and Buenos Ayres was still in *statu quo*, and nothing had occurred indicative of a speedy change.

BRAZILS.—By a recent arrival from Rio, of the 28th Feb., we learn that there had been, just previously to the packet's departure, a total change of Ministry, caused by the Emperor's refusal to accede to the request of the Prime Minister, Carneiro Leno, as to the removal of Senhor Saturnino from the post of Inspector-General of the Custom House. The present Ministry, formed under Senhor Torres, is said to be more favourable to the formation of a treaty with England than the former one; still the expectation of any early beneficial conclusion was not over sanguine among the British residents. At Rio Grande matters were quiet, but making slow progress to a permanent re-establishment of order and peaceable Government. The papers state as a proof of the encouragement given to the slave trade in the Brazils, that adjoining the house at Rio, to which Captain Willis, of the Frolic, had been carried for his recovery from the severe wounds inflicted upon him on the 5th January, near Santos, by several ruffians engaged in the slave trade, there exists an extensive "baracoon" for newly-landed negroes, generally from 300 to 500, and at a few hundred yards from thence two more baracoons, one for adults, and the other for boys and girls. The two latter adjoin the Emperor's garden, surrounding a small bathing villa, where both the Emperor and Empress repair frequently for sea-bathing! The baracoon for the children is secured from theft by an immense quantity of broken glass placed conspicuously on the top of the Emperor's garden wall, an open barred window actually looking into the baracoon, where the slave children are seen grouped around from the Emperor's gravel walk. Captain Willis is slowly recovering, but the wounds in his head still remain open, and he is now at sick quarters.

Parliament.

HOUSE OF LORDS.

Tuesday.—The House of Peers resumed its sittings this day, after the recess.—Lord COTTENHAM postponed the second reading of the Debtor and Creditors' Bill to Monday next, at the request of the Lord Chancellor.—On the motion of Lord MONTEAGLE, the Forestalling, &c., Offences (Ireland) Bill was read a second time.

Thursday.—Lord NORMANBY corrected a misapprehension of what he had said on a previous evening respecting the appointment of Mr. O'Brien as stipendiary magistrate in Ireland. It had gone forth that his objection to that gentleman's transfer was because he was unacquainted with the county to which he had been sent, whereas his objection really was because Mr. O'Brien was too much connected with that county.—Lord CAMPBELL brought in a bill to enable actions to be brought into English Courts of Justice against British subjects residing abroad, in cases in which the cause of action had arisen in this country. He proposed that the process of the Courts here should extend to all English subjects abroad; and that when notice of action should be personally served in a foreign country, the debtor should be liable to the action in like manner as if he had been served within the jurisdiction of the Court. His Lordship stated that on the 1st of January this year there were not less than 60,000 British subjects domiciled in France, and 50,000 residing there temporarily, or passing through it; and of these, a very large number were debtors avoiding service of process from their creditors.—The Bill was read a first time.

Friday.—Messengers from the Commons brought up several railway bills, which were read a first time.—The Earl of ROSEBERY presented a petion from Berwick-upon-Tweed, against the Dissenters' Chapel Bill; also a petition in favour of the bill.—The Earl of RADNOR presented several petitions in favour of the same measure. Petitions to the same effect were presented by Lord Auckland, the Marquess of Normanby, and Lord Brougham.—The Bishop of EXETER presented several petitions against the bill, and said he would oppose the bill if good reasons for passing it were not brought forward by its supporters. The right rev. prelate also presented a petition from a body in Ireland, styled the Presbyterian Church in Ireland. If the petition had come from a body so styled in Scotland, he would not have objected to it; in Ireland there was no Presbyterian Church recognised according to the canon dated 1603, and which was promulgated in Ireland about thirty years later.—Lord GOSFORD gave notice that on an early day he would call attention to the state of public works in Ireland.—The Marquess of NORMANBY gave notice that on Monday he would call attention to certain omissions in the papers recently laid on the table relative to Gwalior.

HOUSE OF COMMONS.

Monday.—The House re-assembled this day, after the Easter recess. New writs were moved for Huntingdon, Exeter, and Woodstock, in the room of Sir F. Pollock, promoted to the Chief Baronship of the Exchequer; Sir W. Follett, transferred from the office of Solicitor-General to that of Attorney-General; and Mr. Thesiger, who has been appointed to succeed Sir W. Follett as Solicitor-General.—Mr. WYSE asked that the second reading of the Irish Franchise and Registration Bill, which was fixed for Friday, should be postponed for a fortnight, in order to give the Irish Members and their constituencies fuller time for its consideration.—Sir R. PEEL was strongly opposed to postponements, as it wasted the earlier period of the session, and threw important measures over till the close, when they either received hasty consideration, or were abandoned. But, in order to evince his desire that full time should be given for the consideration of this measure, he consented to the postponement of the second reading from Friday till a future day, of which notice will be given.—On the motion that the House should go into committee of supply, Mr. M. GIBSON called attention to a petition from Manchester, presented on the 1st April last, complaining of inconveniences endured by the mercantile community of that town from the Post-office arrangements.—Sir G. CLERK stated that the Post-office authorities were anxious to remove the grievances complained of, but were impeded by obstacles in their arrangements with the railway companies.—Mr. M. PHILIPS, Dr. BOWRING, and the CHANCELLOR of the EXCHEQUER, added some observations on the subject, the latter intimating that Manchester, with a little patience, may ultimately obtain what it wanted, without compelling the Government to submit to the exorbitant terms demanded by the railway companies.—Sir R. PEEL added, that the railway companies would best promote their own interests by showing a disposition to give every facility, on fair terms, for the conveyance of letters.—The subject, after some further conversation, dropped.—Sir R. H. INGLIS asked if the Government were contemplating any measure on the subject of parochial assessments.—Sir J. GRAHAM replied that the intended amendments of the Poor-law, especially on the law of settlement, would necessarily involve, as a consequence, an amendment of the law relative to parochial assessment. If, therefore, at some future time, he had the honour to fill the situation he now occupied, it would be his duty to submit such a measure to the House.—The House went into committee of supply, and several votes were agreed to.—On the vote of 59,350*l.* for salaries and expenses of officers of both Houses of Parliament, Mr. HUME moved the reduction of the vote by 15,000*l.*, being the sum demanded by the House of Lords for their proportion of the public funds. He said his reason for refusing them the sum required was, because their Lordships will not condescend to furnish their bill, item by item, to the Lower House. For the full vote, 69; for Mr. Hume's curtailment, 13; majority, 56.—On the vote for the salaries and expenses of the Exchequer department, Col. SIBTHORP gave notice, on some future day, to move an address to the Crown to remove, as speedily as possible, Lord Monteagle from the Comptrollership of the Exchequer. He should claim this saving to the public on the ground that a more useless office, and a more useless person to fill it, never existed.—On the vote for 1574*l.* for Queen's plates to be run for in Ireland, Mr. WILLIAMS objected to it on the virtuous plea that horse-racing encouraged gambling and immorality in that country. On a division there were:—For the vote, 45; against it, 13; majority, 32.—The Chairman having reported progress, obtained leave to sit again on Friday.

Tuesday.—In answer to Mr. W. O. STANLEY, Sir J. GRAHAM stated that he had taken measures to have the late disgraceful state of the prison of the Court of Requests in Birmingham changed, so that it was now regulated in a manner satisfactory to the Mayor and Recorder of the borough.—Mr. WYSE moved for a return of the names, offices, places of birth, salaries, and ages of all persons holding offices in the Customs, Excise, and Post-office departments of the United Kingdom, with the dates of their appointment, and present location, his object being to show that Ireland had not a fair share of official patronage.—Sir R. PEEL decidedly objected to the production of these voluminous returns. It was objected to by Mr. Wyse that the Postmaster-General in Ireland was not an Irishman; true, but the Postmaster-General in Scotland was an Irishman. So, also, the head of the Irish police was said not to be an Irishman; but the very last time he had appointments connected with the police force in England to dispose of, they were, two in number, conferred on Irishmen. Look to the united service; Sir Hugh Gough, lately appointed Commander-in-Chief in India, was an Irishman. As to the return called for, there were no less than 22,000 individuals connected with the various public departments of the Customs, Excise, and Post-office; and what member of the House would venture to move that such returns, if granted, should be printed? He protested against the absurdity of an inquisition into the nativities of individuals who were subjects of the same united empire, and which, if gone into, would only perpetuate angry feelings.—Mr. FRENCH supported the motion.—Mr. HUME objected to it, as keeping up a useless feeling of nationality; but thought that, without reference to places of birth, there should be lists of every individual receiving public pay, for the public information.—Sir C. NAPIER was of opinion that, in public appointments, the question was not whether the individual were English, Scotch, or Irish, but who had the most interest.—Mr. WARBURTON, thought that a list of applicants, rather than of successful candidates, would be the most useful return.—Sir R. PEEL remarked that in that case the objection would apply with tenfold force, in proportion to the number of applicants.—Mr. WYSE, after a few remarks, suffered his motion to be negatived without a division.—Mr. WYSE then moved for a return of the amount of Irish income which is assessed to the property-tax in Great Britain, distinguishing the amount charged under each schedule; but he withdrew it on the intimation by Sir R. Peel that there were no official means of granting it.—Mr. Alderman COPELAND next moved for various returns connected with the working of the Anatomy Act, which he considered to have been injurious in its operation.—Sir JAMES GRAHAM objected to the motion. The schools of anatomy were sufficiently and regularly supplied; all outrages on public decency were avoided; and it was his opinion that the greatest possible inconvenience would arise from the production of the reports to which the motion was directed.—After some conversation the motion was withdrawn.—Mr. HUME brought forward a resolution pledging the House to a formal approbation

of the recommendations of the select committee of 1841, relative to the freer admission of the public to Westminster Abbey, St. Paul's, and other cathedral churches throughout the kingdom. He urged the behaviour of the bulk of the working classes in their visits to the British Museum, the National Gallery, and other public places, as a strong reason why this additional indulgence should be granted to them; and, in anticipating objections, declared his strong objection to profaning the temples of peace by the abominations of monuments to military and naval men, surrounded with all the paraphernalia of war. He would transfer them either to some public national building, or, at least, give the Government some control over their erection. It was but fair, he admitted, to the present ecclesiastical guardians of Westminster Abbey, and also to other dignitaries of the Church, to state that there was a considerable disposition on their part to grant the required facilities, consistently with the security of the edifices under their care.—Mr. Wyse seconded the motion, paying a compliment to Mr. Hume for the singular zeal and perseverance with which he has prosecuted this subject, and enlarging on the elevated feelings which freedom of access to our cathedrals was calculated to inspire amongst the general community. He recommended the example of France to our Government, in the appointment of a commission or board for the care of our national monuments.—Sir R. H. Inglis denied that our ecclesiastical edifices were national property; argued that the Reformation had not deprived the Church of its vested right in them; and, looking to the history of the past, saw that great national intellectual appreciation might co-exist with great moral corruption. He could not, therefore, concede that sight-seeing, even in a cathedral, was an efficient means of Christianising the people. The introduction of trophies of war, figures of heathen gods and goddesses, &c., in our cathedrals was utterly incongruous; even the fine statue of Watt, by Chantrey, in Westminster Abbey, was wholly unsuited to the character of the edifice. For this, however, Parliament was more responsible than the deans and chapters. Though opposing the motion, he approved of the suggestion thrown out by Mr. Wyse for the adoption, by the Government, of the example of France, in appointing a commission for the protection of our national monuments; there was nothing, for instance, but individual character to insure the preservation of Stonehenge.—Mr. M. Milnes, looking to the high purposes for which our religious edifices were raised, considered that the receipt of fees at the doors of our cathedrals was gross profanation. The people, when entrusted with the care of our national monuments, constituted the best police; and Westminster Abbey would be as safe with Englishmen as Nôtre Dame with Frenchmen.—Sir R. Peel, having carefully watched the results of the free admission of the people to our public institutions, was confirmed in his conviction that the sight of works of art had a good moral effect. The argument of Sir R. Inglis as to great corruption co-existing with great refinement and civilisation, would, if pushed to its limits, lead to the conclusion that we should set limits to the progress of civilisation. Westminster Abbey was open for divine service on Sundays; and by exacting a fee on other days, we held out an encouragement to individuals to visit it, not for religious worship, but from motives of curiosity. He was quite satisfied that, taking the ordinary precautions for the safety of the edifices and monuments, still further relaxations might be made in favour of the free admission of the people, with the probability of the most beneficial results. But Mr. Hume's motion sought to effect the object by indirect means. The deans and chapters were the legal guardians of our cathedrals; and there was a growing disposition on their part to concede the desired privilege to the public. But the adoption of an undefined abstract resolution, without following it up by an enactment, would not only rouse feelings of jealousy and resistance, but disparage the authority of the House. He hoped, therefore, that the motion would not be pressed to a division.—Mr. Ewart complained, that Sir. R. Peel, with his opinions in favour of the principle, did not support the resolution.—Sir W. James concurred in the principle, and regretted that the authorities of the Church should keep the cathedrals closed; but he could not vote for a resolution upon a matter upon which he thought the House of Commons had no jurisdiction.—Mr. Borthwick said, that if Mr. Hume went to a division, he would vote with him.—Colonel Wyndham was in favour of free access for the public, but thinking that the House had no right to interfere, he would vote against the resolution.—Mr. Hume said he had too much respect for Sir Robert Peel's opinion upon this subject to press his motion to a division. He trusted, however, that the almost universal sentiment now expressed would have its effect in the proper quarters.—The motion was then withdrawn.—Sir A. L. Hay then rose to move an address to her Majesty, praying that she will be pleased to confer some honorary distinction on the surviving officers of the Peninsular army: Though abstaining from giving a general sketch of the Peninsular war, he entered into some of the details of the brilliant deeds achieved by an army, which, under its great commander, formed a disciplined body, and had effected services, to which there was no parallel in the history of Europe; and enumerated the names of distinguished officers, who, though engaged in all the great affairs of the Peninsular war, were yet unable to exhibit such a mark of distinction as was worn by any drum-boy who had been lucky enough to be within sound of the guns at Waterloo. He would propose that medals should be given to every surviving officer of the Peninsular war, and also to the families of those who had died. It might be objected that it was now too late—the time was too far gone by. But it was not as a paltry decoration that he asked for this distinction; all these honours were regarded as honourable rewards, and constituted the stimulus for farther efforts; and while they were freely bestowed on our Indian army, it was not fitting that officers, the most meritorious of those who had shed their blood in the service of their country, should be left unrecognised.—Lord Arthur Lennox seconded the motion.—Sir H. Hardinge opposed the motion, not because he did not appreciate the merits of the Peninsular army, but because it would be impossible to confine the proposed distinction to the survivors of this army alone. The survivors of the armies of Egypt, America, and India, would have also their claims to distinction, and that would be a very serious extension. When it was recollected that the Duke of Wellington was at the head of the Army, the House might rest assured that every possible justice would be done to the Army; and when the difficulties which this motion would, if carried, produce, were borne in mind, the House should pause ere it consented to acquiesce in it.—Sir C. Napier supported the motion. Colonel Sibthorp, Capt. Berkeley, and Sir C. Fitzroy, recommended its withdrawal. It was ultimately withdrawn.—Lord Ebrington moved for returns connected with the appointment of stipendiary magistrates in Ireland during the three last years of the late Administration. He did so for the purpose of disproving the imputation cast upon Lord Fortescue by Sir J. Graham on a late occasion, that he had unduly made seven new appointments when on the eve of quitting office, and at a period when he knew that the fate of his Government was sealed.—Sir J. Graham admitted that he had, in the suddenness of debate, made one or two inaccurate statements, but persisted in the main imputation, that Lord Fortescue had made the unusual number of seven appointments of stipendiary magistrates, betwixt the February and August of 1841—had created four new offices—and had made the appointment to one of them on the very day on which the Whig Government retired from power.—A debate followed, in which Mr. Baring, Lord Eliot, Mr. Labouchere, Lord Stanley, and Sir R. Peel, took part; and the motion was agreed to.

Thursday.—Lord Ashley stated the course he proposes to take in the Factory Bill. He had intended, he said, to move an instruction to the committee on the Government Bill, but the Speaker had given him to understand that it would not be consistent with Parliamentary law to do so. The Speaker had likewise informed him that he would not be able to move the insertion of any clause till after all the clauses of the Bill had been disposed of in committee. That being the case, he thought it better to take another course, and as it was probable that in committee there would be no opposition to the Bill as it now stood, and the committee stood for the 26th, he had determined to move, on the third reading, that certain clauses be added to the Bill, for the purpose of carrying out the amendment he contemplated. Her Majesty's Government had concurred in that arrangement, and had given him to understand that they would arrange the business of the House so that, if the Bill went through committee on Friday, the 26th, the third reading might be had on Friday, the 3d May.—Lord Ashley then gave notice that on the third reading of the Bill he should move the addition of clauses limiting the number of hours of work per day in factories to eleven hours, until the 1st of October, 1847, and after that period to ten hours.—Sir J. Manners gave notice to submit his motion relative to the law of mortmain, on Thursday, the 2d May.—In reply to a question from Mr. P. M. Stewart, Sir R. Peel stated that on Monday, the 6th May, he should bring forward the question of the Bank of England charter.—Sir J. Graham fixed Monday next for the second reading of the Factory Bill, and for the second reading of the Ecclesiastical Courts Bill; and Thursday next for the committee on the Poor Law Amendment Bill, after the committee on the Factory Bill.—Mr. Pakington, at the request of Sir J. Graham, withdrew the Quarter Sessions Bill.—The County Coroners' Bill was recommitted, and new clauses added by Sir J. Graham.—Mr. M. Gibson brought forward a motion relative to Agricultural Statistics. He disclaimed all intention of raising a Corn-law discussion, by anything which would insinuate obliquely that we did not grow enough corn for our subsistence. Free trade was a sort of civil right, and did not rest on the question of sufficiency or insufficiency; for, if we grew ten times more corn than we did, the argument for freedom of intercourse would still be perfect and complete. He placed his motion on its own independent grounds, that of its practicability, its importance, and its necessity to the advancement of that portion of statistical science connected with national progress. All statistical writers deplored the absence of the information which he sought, and pointed out the evils which this omission in the machinery of the Executive led to. M'Culloch, Porter, Tooke, the author of the "History of Prices," the Speaker himself, in a pamphlet which he had published, and other authorities, had pointed out the advantages which would ensue from the collection of agricultural statistics by some department of the Government. It would solve the interesting problem of the relation between food and population; would enable us regularly to trace the connection between produce and price; would put an end to the controversies arising out of conflicting statements, based on conjectural estimates; while the farmers, if it were properly explained to them, and backed by legislative authority, would have no rational objection to the returns from which the information would be derived. For Excise reasons, we required returns from the growers of hops, and also of the sales of grain, and therefore he hoped that the Government would not oppose his motion, which was:—"That an humble address be presented to Her Majesty, representing, that in the opinion of this House it is desirable to obtain authentic information upon all matters connected with the agriculture of the United Kingdom; that this information is altogether deficient, so that at this time even the extent of land under cultivation, and the amount of its produce, are subjects only of vague conjecture; that the total absence of all statistical knowledge in reference to this important subject, has at various times proved detrimental to the public interests; and praying Her Majesty to devise measures for supplying to Parliament, from time to time, statements of the breadth of land under cultivation for each species of produce respectively, and the amount of produce derived from the same, together with such other information as will exhibit, as far as practicable, a perfect view of the agricultural capability and production of the United Kingdom."—Mr. Gladstone admitted the importance and the desirableness of the objects contemplated by the motion. Perhaps, of all parties, the grower of corn would be the one most benefited by a good system of agricultural statistics; and the Government had the subject much at heart and were actually engaged in ascertaining to what extent it was practicable to carry it into effect. It would, therefore, be imprudent in the House to pledge itself to the motion before they had really ascertained how and in what manner it could be best carried out. He hoped, therefore, that Mr. Gibson would rest satisfied with these assurances, and withdraw his motion.—Mr. Christopher was assured that it would be a very desirable thing if the farmer could know authoritatively the actual quantity of produce grown in this country, as it would tend still farther to promote steadiness of price. He, for one, as the representative of a purely Agricultural district, had no objection to the motion, but he thought that it would be best left in the hands of the Government.—Mr. Brotherton recommended Mr. M. Gibson not to press his motion, on which Mr. Gibson consented to its withdrawal.

Friday.—After several petitions had been presented, notices of motions were given, among which was one by Mr. Roebuck, that in committee on the Factory Bill he should move that it be an instruction that no clause be agreed to that would have the effect of limiting the hours of labour of parties above 18. The Irish Corporations Bill was read a second time, and the second reading of the Irish Registration Bill was fixed for the 29th, to be taken immediately after the Budget. Sir J. Graham fixed the County Court-Bill for Monday, to be then considered in committee. On the motion for going into a committee of supply, incidental discussions arose on different topics; Mr. Hume objecting to the expenses of the House of Lords, and Sir C. Napier to the system of dockyard management. The House then went into Committee of Supply, beginning with the Colonial Estimates.

CITY.

Money Market, Friday.—Consols for account closed at 99⅝; Reduced Three per Cents, 98⅝; Three-and-a-half per Cents. Reduced, 102; New Three-and-a-Half per Cents. 102⅞; Exchequer Bills, 74*s.* to 76*s.* prem.

GAZETTE OF THE WEEK.—BANKRUPTS.—T. Watson, Camomile-street, Bishopsgate-street, London, victualler—R. Cross, Jermyn-street, St. James's, saddler—H. Thorpe, Kensington, linendraper—J. Nall, Chesterfield, Derby, grocer—J. Quin, Liverpool, painter—J. Metcalf, Liverpool, grocer—J. Battye, Courtney-terrace, Kingsland, linendraper—M. Waller, Percy-street, Tottenham Court road, and Birmingham, patent electro-plater—J. Carpenter, Rothwell, surgeon—J. J. I. Syer, Bridge-street, Blackfriars, undertaker—J. Lord, Hartfield, Sussex, dealer—R. Allinson, Whitehaven, ironmonger—W. Payne, Newcastle-upon-Tyne, builder—J. Slack, Hulme, Manchester, filtering-machine-manufacturer—G. Rothery, Wakefield, currier—J. Dowie, Chepstow, wine-merchant—J. Atkins, Aston, Warwickshire, beershop-keeper—J. Dimmet and J. Grimes, Bristol, plasterers.

SCOTCH SEQUESTRATIONS.—D. Wright, Glasgow, provision merchant—W. Glenny, Edinburgh, china merchant—A. Paton, Paisley—A. Thomson, Dalry, horse dealer—R. M. Wright, Auchinleck, Ayr—A. Macgregor, Edinburgh, coach-hirer.

Metropolis and its Vicinity.

The Law Courts.—On Tuesday it being understood that Sir F. Pollock, the newly-appointed Lord Chief Baron, would take his seat, the Court of Exchequer was densely crowded. The seat within the bar was crowded to excess, and the leading Queen's Counsel were present. The Barons entered the Court in the following order:—Mr. Baron Rolfe, Mr. Baron Alderson, the Lord Chief Baron (Sir F. Pollock), and Mr. Baron Parke. The whole of the bar rose and bowed simultaneously to the bench, which was returned more particularly by the Lord Chief Baron. After the recognition between the bench and the bar had passed, their lordships took their seats, when the Remembrancer of the Court administered the oaths in the customary manner. On the previous day, being the first day of Easter Term, agreeably to ancient custom, the Lord Chancellor gave a breakfast to the several Judges, and to the different Members of the minor courts.

New Coal-Tax.—A public meeting was held at the Crown and Anchor on Tuesday, to oppose the proposed tax on coals for the purpose of defraying the expense of the embankment of the Thames. The following gentlemen were present:—Mr. Masterman, M.P., Capt. Rous, M.P., Colonel Wood, M.P., Mr. Hawes, M.P., Mr. Ord, M.P., Lord H. Vane, M.P., Sir C. Napier, M.P., Mr. Barclay, M.P., Mr. Forster, M.P., Mr. Bateman (deputy chairman of the chartered gas company), Mr. Christie, M.P., and others interested in the coal trade. Mr. Masterman, M.P., having been placed in the chair, various resolutions were proposed and carried, the speakers all dwelling upon the impolicy and injustice of the tax. A petition, embodying the sentiments of the meeting, was agreed to, to be presented to the House of Commons by the chairman, and the co-operation of the eight metropolitan members was requested to support it. A deputation, consisting of the members of Parliament present, was then requested to wait upon Sir R. Peel on the subject.

Royal Mail Steam-Packet Company.—The annual meeting of this company was held on Thursday. The report stated that the fleet of the company was in a high state of efficiency. The working account for the first six months of 1843, showed a balance, subject to insurance and wear and tear, of 34,341*l.* 15*s.* 7*d.*, and the balance of the present account for the whole year was 94,219*l.* 9*s.*; so that the last six months produced 59,877*l.* 13*s.* 5*d.* The company have claims against the estate of Acraman and Co. for 34,189*l.* 17*s.* 7*d.*, which, if recovered, will be in reduction of the costs of the Avon and Severn steamers. Not a single casualty had occurred in the last twelve months, and every outstanding claim, arising out of past transactions, having been satisfied, the service of the present year will commence free from all past liabilities. 25,000*l.* was to be set apart annually as a fund for insurance. The sum remaining due at this time for loans is 70,000*l.* The directors were clearly of opinion that, during the current year, there would be a considerable sum applicable to the liquidation of debt, to the replacement of capital, or to the payment of a dividend. The report was unanimously adopted.

St. Stephen's Walbrook.—On Thursday a vestry meeting, convened by the Rector, was held for the election of churchwardens. Dr. Croly, having taken the chair animadverted upon the conduct of Alderman Gibbs, whom he charged with having opposed the wishes of the parishioners, and with having allowed the church to fall into dilapidation. Mr. Rock and Mr. Flight were unanimously elected churchwardens for the ensuing year, and Mr. Crosby was elected vestry clerk. Mr. Howett said that Mr. Pearce, their late vestry clerk, had not as yet been paid his salary; and that the rector's stipend was also unpaid for the past year.—On the following day the select vestry, convened by Alderman Gibbs, also assembled for the election of churchwardens, when, finding that the church had been taken possession of by the opposite party, it was proposed to hold the vestry in some other place; in consequence of which, they proceeded to the residence of Alderman Gibbs, where the Alderman and Mr. Whitaker were elected. There are, therefore, two sets of churchwardens for the ensuing year, and the question of the legality of their election must now be settled by the court of Queen's Bench.

The Sea Bathing Infirmary.—The annual meeting of the supporters of this charity was held last week; Mr Cabbell in the chair. After the preliminary business, the Rev. Dr. Russell, chairman of the committee, said that they had been unable to prepare a report. They had submitted eight questions to the treasurer, Alderman Gibbs, but had received no answer except to the first, and even that was not given till the previous day. Under these circumstances, the committee had nothing to report. The Rev. J. Hodgson, of Margate, complained of the way in which Alderman Gibbs had treated the committee. He had himself come up to London, a distance of 70 miles, in order to promote the objects of the charity, but he could get no information. Alderman Gibbs promised to answer the questions submitted to him in a week, but it appeared that the committee were as much in the dark as ever. He regretted to say that the institution was in a state of bankruptcy, and the governors could not be expected to continue paying up their subscriptions while such a system of management was followed. Last year they had 150*l.* in hand, and Alderman Gibbs told them that there were no liabilities, but he had since discovered that there was 800*l.* due to Mr. Mercer, builder, of Margate, and that the institution, in place of having a fund capital, was 1000*l.* in debt. Unless an institution enjoy the confidence of the public, it could not prosper, nor could its objects be efficiently carried out. Alderman Gibbs said that, after 32 years' devotion to the charity he was not prepared for the speech of the rev. gentleman. It was quite true that he had at the last meeting stated that there were no outstanding claims upon the institution; but what he meant by that was, that there was no debt on the building account. Whatever claims remained would be settled like all other bills, when the charity was ascertained to be correct. After some discussion it was resolved that the institution should be again opened, and that the investigation into the accounts should be continued. Alderman Gibbs was re-elected treasurer, from which the Rev. Mr. Hodgson resigned his seat as a director.

Suppression of Art-Unions.—The Art-Unions, after having been tolerated for eight years, have been

ruptly brought to a termination, by an interdict from the Government to the Art-Union of London, just at the moment that the subscription list was completed, and everything arranged for the drawing. The following is a copy of the notice sent to the secretaries:—"Treasury, April 12, 1844. Sirs—I am commanded by the Lords Commissioners of her Majesty's Treasury to acquaint you that an institution, called the Art-Union of London, having for its object the chance distribution of Prizes of Works of Art, has been brought under the notice of their Lordships, and that they are advised that it is illegal; and I am also to acquaint you that the further continuance of the same will render all parties engaged in it liable to prosecution. I am, Sir, your obedient servant, W. R. Reynolds. To G. Godwin, and Lewis Pocock, Esqrs." The committee immediately met, and addressed a memorial to Sir R. Peel, which led to an interview between them and Sir G. Clerk, as the representative of the Treasury. Sir G. Clerk said, that the attention of the Treasury having been directed to the subject, they had submitted a case to the Attorney and Solicitor-General, and that, in their opinion, the whole of the Art-Union Associations were illegal, and that it was thought due to the committee to give them early intimation of the fact. Sir R. Peel could not interfere in the matter; all he could do was to inform them of the law. He (Sir G. Clerk) was himself a subscriber, and so were many others connected with the Government; still, for the Treasury to give any sanction to further proceedings was quite out of the question. The most prudent course, he thought, would be to postpone the general meeting appointed for drawing the prizes, giving the subscribers notice to that effect, and suspend proceedings until it could be ascertained whether or not the Legislature would protect such societies. The committee have since announced their intention to postpone the general meeting, at the same time they assure the subscribers that "their interests will not be allowed to suffer."

Hungerford Suspension Bridge.—The daily papers state that this structure is so near its completion that during the present summer the public will be enabled to cross from Hungerford Market to the Belvidere-road, Lambeth, for the toll of one farthing each. This bridge is the only one in the metropolis for foot passengers alone, and erected on the principle of suspension. The entire length of the bridge suspended on chains will be 1342 feet 6 inches; that is, the centre span or arch, 676 feet 6 inches; those on the side 333 feet each. The width within the chains will be 14 feet, and a clear pathway of 13 feet; the height of the flooring above high water, in the centre 31 feet 6 inches, at each pier 28 feet 6 inches, and at each abutment 22 feet 6 inches; the height of each pier above the flooring 55 feet 3 inches; the number of main plates which form the chain is 2500, about 24 feet each in length. The total weight of iron is between 700 and 800 tons, and the estimated cost, including the approaches, is 110,000*l.* It will be seen that its centre span alone is nearly 100 feet greater than the entire of the Menai bridge, which is 579 feet 10 inches. It is likewise 274 feet greater than the centre span of Hammersmith-bridge, which is 402 feet 3 inches; and above three times as great as the centre arch of Southwark-bridge, at present the largest in London. Indeed, with the exception of the wire bridge at Fribourg, in Switzerland, which is 870 feet, it will be the largest in existence. It was designed by Mr. Brunel.

Anti-Corn-Law League.—The weekly meetings of the League were resumed on Wednesday night at Covent Garden Theatre. The house was not so crowded as usual. Mr. Cobden presided, and opened the business of the evening; after which the meeting was addressed by Mr. Ward, M.P. for Sheffield, Col. Thompson, Mr. G. Thompson, and Mr. Moore.

Indian Rubber Pavement.—A portion of Indian rubber pavement has been laid down in the forecourt of the Admiralty, at Whitehall, which has been tested in a very effectual manner: three heavily loaded coal-waggons, each carrying seven tons, were driven over it last week, when the pavement became considerably depressed, but from the elasticity of its nature immediately resumed its former appearance as soon as the wheels had passed.

The late Deptford Tragedy.—Mr. J. Dickenson, the husband of the woman who recently killed her two children while labouring under insanity, committed suicide last week by hanging himself. The late occurrence had preyed on his spirits, and produced temporary insanity.

Accidents.—The Jury, in the case of the late accident at the new terminus of the Dover Railroad, returned a verdict of "Accidental Death," with a recommendation "that greater care should be taken in future in the construction of such roofs to have the ridges of the roofs with the skylights properly braced and supported whilst undergoing the process of completion."

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending April 6th—West Districts, 134; Northern, 179; Central, 174; Eastern, 200; Southern, 236; Total, 923. Weekly average for the last five years, 946.

Provincial News.

Bagshot.—During the past week the extensive fir plantations belonging to the Crown in the vicinity of Bagshot Park and the Military College, at Sandhurst, have been twice fired by incendiaries, to the alarm and terror of the respective neighbourhoods. Upwards of 14 acres are completely destroyed, besides considerable damage done to several hundreds of young trees, which are only partially consumed. A reward of twenty guineas has been offered by the Commissioners of Woods and Forests for the discovery and apprehension of the guilty parties.

Bradford.—A meeting in favour of Lord Ashley's proposition for restricting female labour to ten hours was held in this town last week. Mr. J. Pollard, a magistrate, presided. The meeting was addressed by Mr. Ferrand, M.P., Mr. Oastler, Mr. W. Walker, and others. Resolutions in favour of a Ten Hours Bill were unanimously adopted.

Bristol.—At the Quarter Sessions on Tuesday, the Rev. Henry Heathcote, described in the calendar as 40 years of age, a clergyman of the Church of England, and a married man with two sons, was placed at the bar charged with a series of offences, which disclosed a state of moral depravity on the part of the prisoner scarcely possible to exist with sanity of intellect. He was found guilty, and sentenced to pay a fine of 20*s.* for the first offence, and for the second to undergo 12 months' imprisonment in the common gaol of the city, and pay a further fine of 20*s.* This conviction has been noticed to the Bishop of Gloucester and Bristol, who has directed the proper proceedings to be instituted, under the Church Discipline Act, against Mr. Heathcote, with a view to his deprivation and deposition from the ministry.

Halifax.—A meeting in favour of a Ten Hours Factory Bill was held in this town on Friday, and attended by nearly 3000 persons, most of whom were working men. An operative presided, and Mr. Oastler addressed the meeting at great length, condemning Mr. C. Wood's assertion in Parliament, that the operatives of Halifax were not in favour of a Ten Hours Bill. The meeting loudly expressed their denial of Mr. Wood's statement, and resolutions in favour of Lord Ashley's measure were unanimously adopted.

Holmfirth.—On Saturday a public meeting in favour of the Ten Hours Factory Bill was held in the new Town-hall of this place, holding 800 or 1000 persons. It was crowded in every part. The meeting had been called by the Constable of the graveship, in consequence of a requisition signed by about 60 inhabitants, rate-payers of the town, 21 of whom are millowners and manufacturers. The chair was taken by the Rev. E. Woodland, the incumbent. Resolutions in favour of a Ten Hours Bill were proposed and seconded, when Mr. Robinson moved an amendment, embodying three resolutions to which the millowners and manufacturers of Halifax had come on the 11th inst. This amendment was seconded by Mr. C. Beardsall, the secretary of the Anti-Corn-Law League, an office which Mr. Robinson himself not long ago filled. On the amendment being put, about three hands were held up for it in the body of the meeting, and eight or nine on the platform. The chairman announced the amendment to be negatived, and the original resolutions to be carried by a large majority.

Huddersfield.—A meeting in favour of a Ten Hours Factory Bill was held in this town last week. The Rev. J. Bateman, the vicar, presided, and the hall in which the meeting was held was crowded to excess. Petitions to Parliament in favour of a Ten Hours Bill were unanimously carried.

Huntingdon.—On Saturday last a meeting of about 2000 persons was held in the large room of the Huntingdon Literary Institution for the purpose of hearing a discussion on the subject of the Corn Laws, between Dr. Sleigh, of the London Agricultural Protection Society, and Mr. Acland, the Anti-Corn-Law League missionary. Mr. Herbert, the Mayor of Huntingdon, presided as umpire; Mr. Veasey, banker, was chairman for Dr. Sleigh, and Mr. Martin, the Mayor of Godmanchester, was chairman for Mr. Acland. Dr. Sleigh, in opening the discussion, contended that "the principle of protective corn laws is not only just, but their enactment and continuance indispensably necessary to the best interests of all classes in the kingdom." Mr. Acland denied the assertion, and thereupon issue was joined. The disputants spoke alternately for 4½ hours, Mr. Acland closing the discussion. That gentleman proposed to adjourn the debate to Tuesday evening, but Dr. Sleigh wished to terminate it then, which the presidents and umpire agreed to. A show of hands was then called for, and Mr. Martin, one of the chairmen, declared that Mr. Acland had the majority of the audience for him three to one.

Ilfracombe.—On Tuesday week, the brig Francis, of Whitehaven, from Honduras to London, ran ashore at Marlhoe Bay, about six miles west of the Coast-guard station at this place; she was laden with a cargo of mahogany and dyewood, and was so much embedded among the rocks, that she soon went to pieces. At midnight on Wednesday, at least 200 wreckers, of a most desperate character, made their appearance on the beach, to plunder the wreck, but Lieut. Coleman, the chief officer of the Coast-guard, met them with his small party of men, and drove them back, but not before they had a severe conflict, in which the wreckers got the worst of it. The vessel is insured, and all hands were saved.

Keighley.—On Friday night a public meeting of the inhabitants of this town was held, to support Lord Ashley in his efforts to procure the enactment of a Ten Hours Bill. Long before the hour appointed for the commencement the place was densely crowded, and, although the evening was wet, numbers remained outside around the entrances eager to obtain even a glimpse of the speakers. Mr. D. Weatherhead took the chair. The movers and seconders of the resolutions, as at Halifax, were all operatives, with the exception of Mr. Oastler, and resolutions in favour of the ten hours were carried unanimously.

Liverpool.—On Friday night, a free-trade demonstration took place at the Amphitheatre, which was filled by ladies and gentlemen. The speakers were the chairman, Mr. Thornely, M.P. for Wolverhampton, the Hon. Fox Maule, Mr. Ewart, M.P., Mr. Cobden, M.P., Mr. Bright, M.P., Colonel Thompson, and other gentlemen.

Manchester.—On Sunday, one of the most numerous meetings of delegates from the factory districts of Lancashire ever got together, was held in this town, "for the purpose of considering certain statements made in the House of Commons during the recent debate on the Factory Bill," and to answer certain questions connected with the management of factories. After the returns had been delivered, the meeting adopted a series of resolutions, of which the following is the principal:—"Resolved, That this meeting of delegates have taken every possible means in their power to ascertain the opinions of the operatives on the Ten Hours Bill, and most solemnly declare that it is their decided opinion, that nothing short of the adoption of that measure will ever satisfy the factory workers; and that we, as the representatives of their wishes, resolve never to relax in our exertions until that measure is passed through Parliament." Another meeting was held on Wednesday with the same result.

Oldham.—A grant of 1000*l.*, being the first grant from the fund of 10,000*l.* voted by Parliament, for the purpose of providing public walks for the use of the inhabitants of large towns, has been allotted to Oldham; a communication having been received to that effect a short time ago from Sir T. Fremantle, on behalf of Government. The appropriation of the funds is in the hands of the Commissioners of Woods and Forests, upon whom a deputation of the Oldham police commissioners waited some time ago on the subject. It is understood that additional funds will be required to carry into effect the object in view; and measures are to be taken forthwith to promote the design.

Oxford.—The magistrates, at their adjourned sitting on Monday, after hearing further evidence respecting the coach robbery of 1500 sovereigns, decided on committing Richard Elliot, the cigar-merchant, for trial at the next assizes, or to find bail, himself in 500*l.*, and two sureties in 250*l.* each. Mr. Ballantyne, who attended for the prisoner, complained that the bail was exorbitant, and intimated that he would appeal to one of the Judges.

Portsmouth.—The Lords of the Admiralty have resolved on adding several new steam-vessels of the first class to the list of the steam navy, and several line-of-battle ships, upon the models of the Vanguard (80), Albion (90), and the Queen (110). The following are the line-of-battle-ships ordered to be built:—Marlborough (110), Royal Sovereign (110), Windsor Castle (110), St. Jean D'Acre (90), Brunswick (80), Cressy (80). The Cressy is to be constructed upon the lines of the members of the late school of naval architecture. The steam-frigates ordered to be built are the Avenger, Conflict, Dauntless, Dispatch, Niger, and Orion. These are in addition to the steam-frigates already on the stocks—Centaur, Dragon, Gladiator, Sampson, Terrible, Watt, and Vulcan, some of which are nearly completed. Her Majesty's steam-yacht Victoria and Albert, is undergoing several internal alterations preparatory to her being equipped for sea for the use of her Majesty. Among the improvements that are making is the substitution of tubular boilers in lieu of the ordinary ones, the tubular being found to be much superior to the others, and to occupy much less space, by which additional accommodation to her Majesty's retinue is given. The Pantaloon has arrived from the Coast of Africa, where she had been engaged in the prevention of the slave-trade upwards of three years. She brings intelligence of the loss of the Wilberforce steamer, which was engaged on the Niger expedition. She struck on a rock in the Gambia, and so damaged herself that she became a wreck. The masts, yards, spars, and some of the stores were saved, but the hull remains upon the rock where she struck, filled with water.

Preston.—On Monday night a public meeting was held in this town in favour of the Ten Hours Factory Bill, consisting almost entirely of operatives, male and female. The attendance was very numerous; the Temperance Society Hall, where the meeting was held, being one of the largest rooms in the borough, was crowded almost to suffocation. Mr. Oastler and several operatives addressed the meeting, and resolutions were adopted in favour of a Ten Hours Bill.

Salisbury.—On Sunday morning a fire broke out in the extensive buildings in the rear of the principal entrance of Giddings and Co.'s brewery. The whole centre of the chequer formed by four streets, one dense mass of buildings, consisting of the brewery departments, corn stores, tenements, stables, &c., was on fire in every direction, and the property destroyed amounts, it is said, to several thousand pounds.

Sunderland.—The colliers' strike, which has attracted so much notice in Derby and Leicester, has extended to this place and Newcastle. Last week, a meeting of the miners was held at Black Fell, at which about 20,000 were present, and resolutions, demanding a better price for their labour, were agreed to.

Ware.—The Hertford papers announce that the inhabitants of this town have at length taken a step which places beyond doubt their resolute determination consistently to oppose the tractarian changes introduced into the services at the parish church. They have decided on converting the Town-hall into a place of public worship, and on Tuesday last obtained a licence from the county magistrates. It is understood that arrangements are making for the performance of divine worship exactly in accordance with the services in the established church, and that an eminent Wesleyan preacher will officiate.

Whitwell.—On Monday week last the parish of Whitwell, Norfolk, was thrown into a state of consternation in consequence of a man generally accounted honest and respectable, named William Frost, having murdered four of

his children in his cottage. He is a journeyman farmer, and has worked for Mr. Harnon, of Whitwell, for the last 13 years. He had killed his three elder children by beating them on the back of their heads with a large heavy hammer. The youngest, an infant, he put head foremost into a large earthen pot full of water. An inquest was at once held upon the bodies of the children, and a verdict of Wilful Murder returned against the father, who has been committed to Norwich Castle for trial. It appears that he has lately belonged to a new sect called the "Revivalists," and been very active among them as a preacher. Formerly he was a Methodist Ranting preacher. It is generally believed in the neighbourhood that he murdered his children under the influence of fanaticism.

Winchester.—A serious affray, which caused great alarm among the inhabitants throughout this city, took place on Sunday evening between the privates of the 1st battalion of Guards (recently from Windsor) and the 44th Foot. A quarrel having occurred at a public-house between two men belonging to each regiment, the affair was taken up by their respective comrades, to the number of between 300 and 400 on either side; and, from the severe blows which were exchanged, fatal consequences were expected to ensue. Pickets from each regiment, amounting to 300 men, with fixed bayonets, were immediately ordered out; but it was upwards of two hours before the whole of the men would be captured and secured within their respective barracks. Several, who were seriously injured, are now confined to the hospital. The 44th Regiment is 900 strong, and the 1st battalion of Grenadier Guards about 700. From the ill-feeling which has sprung up between them, it is expected that one of the regiments will be ordered to another district.

York.—On Friday morning a special messenger from the Home Office arrived in this city by the mail train, with an order from Sir J. Graham to respite the execution of George Lowther for six days. It will be remembered that he was convicted of the murder of Mr. Moffatt, head gamekeeper to the Marquess of Normanby. Should the respite not be further extended, the execution will take place this day. The prisoner admits that his act was the cause of the unfortunate man's death, but denies any previous feeling of malice or ill-will towards him.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1415*l.*; Birmingham and Gloucester, 2108*l.*; Eastern Counties, 4293*l.*; Edinburgh and Glasgow, 2339*l.*; Great Western, 14,080*l.*; Grand Junction, 7443*l.*; Glasgow, Paisley, and Ayr, 1563*l.*; Great North of England, 1319*l.*; London and Birmingham, 15,281*l.*; South-Western, 5575*l.*; Blackwall, 1131*l.*; Greenwich, 1341*l.*; Brighton, 3889*l.*; Croydon, 401*l.*; Liverpool and Manchester, 4385*l.*; Manchester, Leeds, and Hull, associated, 6094*l.*; Midland Counties, 2476*l.*; Manchester and Birmingham, 3086*l.*; North Midland, 4296*l.*; Newcastle and Carlisle, 1375*l.*; South-Eastern and Dover, 4273*l.*; Sheffield and Manchester, 577*l.*; York and North Midland, 1622*l.*—A direct northern railway from London to York by Lincoln, having in view the connexion of the north of England and Scotland, by York and Lincoln, with the metropolis, is about to be projected. The line is to commence from King's-cross, pass through Chipping-Barnet, Biggleswade, St. Neot's, Huntingdon, and Peterborough, to Lincoln, and thence by Gainsborough, Thorne, Snaith, and Selby, to York. The capital required is 4,000,000*l.* in 100*l.* shares. Among the advantages which it is stated this route will possess are—that the distance between London and York will be 39 miles less than by the existing railways; that it will reduce the distance between London and Edinburgh 39 miles; and that it will be the nearest way to Leeds, Selby, Hull, Halifax, Bradford, Huddersfield, Wakefield, Pontefract, and Sheffield. The work will be placed under the superintendence of Sir John Rennie and Mr. Gravatt, the civil engineers.—Another new line in contemplation is from Edinburgh through Fife to Dundee, with a junction to Perth, which has the support of the most influential and wealthy people of the Scotch metropolis. 800,000*l.* is to be the capital, which is guaranteed to cover all contingencies; and as the line, when it is completed, will be the main trunk for the northern traffic, it appears likely to return a considerable profit.—It is reported that Lord Francis Egerton has an intention to drain dry the Bridgewater Canal, which was constructed throughout on the level without any lock or inequality of bed, and to convert it into a railway from Manchester to Runcorn, for the conveyance of goods and passengers; the communication to be completed by steamers from Runcorn to Liverpool. It is said that there will be no necessity to go to Parliament for any powers to raise money or buy land; for the land belongs to the Bridgewater trust, and the cost of laying dry the canal, laying the rails, &c., will be borne by the trust, or by Lord F. Egerton individually. If the report be true, this is one of the consequences of the recent purchase, by Lord F. Egerton, of the Mersey and Irwell Navigation. In that river line, he will still possess a cheap means of water conveyance, while in the proposed new railway he will gain great facilities for the rapid transit of goods and passengers between Manchester and Liverpool, and the measure will doubtless be advantageous to Manchester, in connexion with the privilege of bonding warehouses.—On Friday morning the directors of the Yarmouth and Norwich Railway, accompanied by General Pasley, the bishop of the diocese, and a few friends, proceeded from the station at the Foundry Bridge to Yarmouth, that General Pasley might inspect and report upon the line. The train went very steadily, and arrived at Yarmouth station in 30 minutes. The line will be opened on the 1st of May.—A special general meeting of the London and Birmingham Company was held a few days since at the Euston station, for the purpose of considering the draft of two bills now before Parliament, for the construction of the proposed railways from Chester to Holyhead, and from Lancaster to Carlisle. Mr. G. Carr Glyn, the chairman, stated that the company had received from the highest authority, intimation that it was the intention of Government to carry out the projected improvement of Holyhead harbour. He then read the clauses of the Bill, from which it appeared that the London and Birmingham Company were to be authorised to subscribe to the extent of one million sterling in the Chester and Holyhead line. The Bill had passed its second reading without any opposition. The Bill for the Lancaster and Carlisle line would authorise the Birmingham Company to raise 100,000*l.*, and the directors had come to a resolution to remain perfectly neutral as regarded all the other Scotch railways projected. Resolutions approving of the provisions of the Bill were then carried unanimously.

IRELAND.

THE STATE TRIALS.—Monday being the first day of Easter Term, there was as great an anxiety among the people of all parties to witness the proceedings, as on any day during the recent trials, every one being eager to know whether the traversers would be called up for judgment. The quays leading to the Four Courts were thronged by numerous groups of the lower orders for hours before the arrival of the Judges; and the squares, hall, and passages, were crowded to excess by a silent but excited multitude, which increased as the day wore on. The Court of Queen's Bench, where the internal arrangements are the same as during the late State trials, was filled shortly after 11 o'clock by the junior bar and the public. Mr. Justice Burton entered the court between 11 and 12 o'clock, when the crier made the usual proclamation that all persons out on bail or recognisances, should come and make their appearance. Several gentlemen were then admitted as barristers, the majority of whom were Roman Catholics,—a circumstance so unusual as to excite general remark. Shortly after 12 o'clock Mr. O'Connell, accompanied by his sons, drove slowly down, followed in silence by a great crowd of persons. As his carriage entered the yard, there was a low murmur through the crowd, and a general anxious movement to see the hon. gentleman as he entered the hall, but there was not the least outburst of cheering, nor any shouting; and as he passed through the hall the crowd followed him without any visible emotion till he retired to the robing room. Messrs. Steele, Ray, and Gray were the only traversers who appeared in court throughout the day, but it was understood that the others were in attendance in case their presence should be required. Mr. Justice Burton re-entered the court at half-past 1 o'clock, at which hour it was as crowded as at any period during the late trials, but from the absence of all the law officers of the Crown, it could be easily conjectured that no motion in the case of the Queen v. O'Connell and others would be brought before the Court, although it was very generally expected that the Attorney-General would have moved for a rule calling on the traversers to appear in Court within four days to receive judgment on the verdict had against them last term. The Lord Chief Justice, and Justices Crampton and Perrin, entered the Court at 3 o'clock, the intermediate time having been occupied in swearing in the county and city grand jurors, and in the disposal of some motions of no public importance. At 3 o'clock, much to the disappointment of the persons who had waited so patiently throughout the day, their Lordships adjourned to the next morning.—Subsequent to the rising of the Court, it was ascertained that a side bar rule had been entered on behalf of the Crown, setting forth that judgment would be applied for on the verdict, unless cause to the contrary be shown within four days. A copy of this rule was served on the traversers the same evening, and the question was expected to be argued on Friday. In the course of the evening however the Crown Solicitor was served with a notice, stating that the traversers intend to apply for a new trial, without prejudice to their moving an arrest of judgment. The grounds upon which they rested their application are twofold, viz.,—that improper evidence on the part of the Crown had been received by the Court, and that partiality in favour of the prosecution had been shown by the Chief Justice in his charge to the Jury.—On Tuesday, Mr. O'Connell swore an affidavit before the Clerk of the Crown, in which he denies having, at any time or place mentioned in the indictment upon which he stands convicted, combined, conspired, confederated, or agreed, with any of the other traversers, or any other persons whatsoever, for the purposes alleged in the said indictment, or that any illegal conspiracy was ever formed, or ever did exist, between him and any of the said traversers. After much technical language in reference to the revision of the jurors' lists, he states, that he believes it to be true that many names had been omitted therefrom that ought to have been inserted; that it was not until after the ballot for the jury on the 4th of January, to try the issue, that he became aware of any such omission; and that the said omissions from the general and special lists, or either of them, have taken place without his consent, knowledge, privity, or sanction; that he had had no communication, either directly or indirectly, with George Magrath, the clerk in the office of the Clerk of the Peace, to induce him or any other person to omit such names, or to tamper in any way with the revision list; and that he verily believes that the omission of such names was not by accident, but was the effect and result of a design and contrivance to prejudice him upon his trial. Mr. J. O'Connell and Mr. Steele swore affidavits to the same effect, and it is probable that the other traversers will do likewise.

Dublin.—The weekly meeting of the Repeal Association took place on Monday, and was remarkable chiefly for a long speech by Mr. O'Connell, in which he again declared his belief that his imprisonment, instead of putting a period to the repeal agitation, would be the main-spring of its universal spread and avowal. The rent for the week was upwards of 600*l.*, including 115*l.* received from the Archbishop of Tuam.—The Presbyterian marriage question continues to produce great excitement. A meeting has been held at the Rotunda, at which a petition to the House of Commons was adopted, praying the House to pass an act, declaring valid to all intents and purposes in law, all marriages heretofore solemnised or hereafter to be solemnised by Protesant Dissenting Ministers in Ireland.—The Dublin steeple-chase took place last week, and Lieut. Vigors, who was riding one of the horses, was thrown and killed on the spot. The jury returned a verdict of accidental death.

Rathfarnham.—The trial of John Toole, for the murder of the priest's housekeeper at this place, after lasting four entire days, was brought to a termination on Monday, and then ended in the acquittal of the prisoner. This case has excited a good deal of interest, both on its own account and by reason of the length of time which has been expended upon its investigation. The main facts are simply these:—The priest, Mr. Roache, resided at Rathfarnham; his establishment consisted of a young man, his nephew, a female housekeeper (the murdered woman), and Toole, a man of all work. On the evening of the murder, which happened to be a Sunday in Jan. last, Mr. Roache ordered his car at five o'clock, and Toole drove him to Mr. White's of Killkee, between two and three miles off up the mountain, to dinner. The nephew went to dine out with a friend, and the housekeeper was left alone in the house. Mr. Roache, on his return from Mr. White's at nine o'clock, found the housekeeper dead—her throat cut—and his desk broken open, and cash abstracted. Suspicion very soon attached to Toole, and in due course he was arrested, and eventually brought to trial. It was thought that he did not sufficiently account for himself from the time he set down his master at Mr. White's till their return back, and a great number of circumstances, curiously concatenated, combined to involve him in a charge of guilt. However, he never attempted to elude the course of justice, and his character previously was good.

Cork.—A circumstance occurred at the close of the late Repeal dinner in this city, which has attracted a good deal of attention. The Waterford town-councillors had arrived in a steamer carrying the Repeal flag, and another bearing the arms of Waterford. On their return, Admiral Bowles fired a gun, and made the steamer heave to, while one of his officers in a 12-oared barge boarded the vessel, and took possession of the flag. It appears however that the Repeal flag had been previously struck at Cork, and that the flag in question was the one bearing the Waterford arms.

Cahir.—From Cahir, dated Monday week, there is the following statement:—Last night while Lord Tullamore was returning to Cahir, where he is quartered, from Brittas Castle, in his gig, two fellows rushed at him, and one presented a gun close at his head, which, on snapping, providentially missed fire. His horse started, and he drove off. Soon after another man rushed at the gig, stared at him, and, evidently seeing he was not the person they wanted, sulkily said, "Good night." This fellow had one hand behind his back, no doubt holding a gun. Both Lord Tullamore and his servant saw and heard the snap of the first man's gun. A Cahir correspondent of the *Evening Mail* states that Mr. Vincent Scully was the person intended to be shot by those who made this attack. This gentleman is the brother of Mr. Scully who had been murdered some time since. "A few nights (adds the writer) before the attempt on Lord Tullamore was made, the captain of infantry quartered at Thurles was dragged off his horse by a gang of fellows, who, just as they were about proceeding to beat him with blackgeons, discovered that he was not the victim intended."

Miscellaneous.

The Corn Trade.—A paper containing accounts relative to the import, export, and consumption of corn, grain, meal, and flour, in the year 1843, ending the 5th of January, 1844, has been printed by order of the House of Commons on the motion of Mr. Gladstone, President of the Board of Trade. It appears that the total quantity of foreign wheat upon which duty was paid for home consumption from the 5th of January, 1843, up to the 4th of January, 1844, amounted to 843,739 quarters; the quantity of British colonial wheat (under the Act 5th Victoria, cap. 14), to 12,406 quarters; and the quantity of Canadian wheat (at the fixed duty of 1*s.*), to 12,412 quarters. No idea, however, can yet be formed of the probably annual importation of corn from Canada at the reduced rate of duty, as the Act (6th and 7th Victoria, cap. 29) only came into operation last autumn. The total amount of duty received thereon was—for foreign wheat, 601,172*l.*; for British colonial wheat, 2532*l.*; and for Canadian, 620*l.* The duties ruling in foreign corn during the period in question (1843-44) amounted, from January to the end of July, 1843, to 20*s.*; in August and September it fluctuated between 18*s.* and 14*s.*; and in October, November, and December, the duty was never lower than 19*s.*, and frequently as high as 20*s.* The average rate of duty throughout the year may be stated at 14*s.* 3*d.* on foreign wheat. The largest quantity of foreign wheat was entered in the month of September, when no less than 600,846 quarters were entered in one week, at a duty of 15*s.* per quarter. As many as 46,396 quarters were entered in the

same month, at a duty of 17*s.*, and 40,501 quarters at a duty of 18*s.* a quarter. The total quantity of foreign wheat and wheat flour imported during the past year amounted to 948,309 quarters, and the total quantity of colonial to 118,239 quarters. The total quantity of foreign and colonial wheat and wheat flour remaining in warehouse at the end of December, 1843, amounted to 220,743 quarters. The highest monthly average price of wheat in England and Wales was 59*s.* 7*d.*, and the lowest 46*s.* 2*d.*, exhibiting a difference between the two extremes of 13*s.* 5*d.* The quantities of other foreign grain imported during the year 1843 were as follows:—viz., barley, 178,686 quarters; oats and oatmeal, 84,597 quarters; rye and rye-meal, 4872 quarters; peas, 39,668 quarters; and beans, 47,999 quarters. It further appears that the average annual price of wheat of last year in the island of Guernsey amounted to 44*s.* per imperial quarter; and in Jersey to 46*s.* 6*d.* per imperial quarter, as far as regarded the produce of the island itself, but only 43*s.* as regarded foreign wheat. The quantities imported into, and exported from Guernsey, were respectively 21,874 quarters, and 4185 quarters. In Jersey, the respective quantities imported and exported amounted to 33,451 quarters, and 7513 quarters. The total quantity of wheat and wheat flour exported from Great Britain was 71,236 quarters, against 1,485,495 quarters imported. The largest wheat-exporting countries to Great Britain are Prussia (which exports about two-thirds of the whole), Germany, Russia, Denmark, and the North American colonies. Belgium takes the greater part of the wheat re-exported from England. From another part of this return we find that in the year 1842 (from the passing of the new Corn Bill on the 29th of April) the total quantity of foreign wheat imported was no less than 2,612,488 quarters, which yielded a duty of 1,093,340*l.*; and thus the gross total amount which has accrued to the revenue of the country since the act came into operation is 1,694,512*l.*, averaging the sum of 847,256*l.* per annum. The average rate of duty paid in 1842 was only 8*s.* 4*d.*, whereas in 1843 it was 14*s.* 3*d.* a quarter. Finally, it appears that the total quantity of corn, meal, and flour of Irish growth imported from Ireland into Great Britain, in the year ended the 5th of January, 1844, amounted to 3,206,484 quarters, of which 413,466 quarters consisted of wheat and wheat-flour.

The South Seas.—The details of another attack on an English whaler, and the slaughter of the whole crew by the natives of one of the South Sea islands, have just been received by the Sussex, a whale ship belonging to Mr. Lyall, M.P., under the command of Captain Hammer, which arrived in the Thames this week, after an absence of four years and three months. The facts were ascertained by the confession of one of the natives who communicated to the Captain of the Sussex that a ship was lying sunk in deep water in the harbour of Quollen island. This proved to be true, and by rigging out a diving-bell it was found that the lost vessel was the Harriet, belonging to Messrs. Boulcott, of Paul's Wharf, London, which left England in 1839. It was also ascertained that the natives massacred the crew when they had come on shore for the purpose of shooting, and had afterwards gone on board to murder the rest, but the persons who were in the ship at the time observed the attack on their comrades; and, seeing a number of canoes putting off towards the vessel, they hastily embarked in a boat, and have not since been heard of, the probability being that, as Quollen's Island is situated at a long distance from any other, they also must have perished in the course of the few following days.

Law.

CENTRAL CRIMINAL COURT.—*The Will Forgeries.*—On Saturday the trial of Mrs. Dorey and the others concerned in these forgeries was resumed. The Court was exceedingly crowded, the most intense anxiety being manifested to hear the charge of Baron Gurney. Immediately on the prisoners being placed at the bar, Mrs. Dorey fell back in a fainting fit. Baron Gurney proceeded to sum up. He said that the indictment alleged that a Mrs. Richards, now deceased, had forged a bond, with intent to defraud the Archbishop of Canterbury; and another count charged the fraud as having been against the commissioners for the reduction of the national debt; and the three prisoners are charged as accessories before the fact, and had rendered their assistance in completing the fraud. The case was this—that one John Stewart had died, leaving no representative, and having stock in the Bank, no person having applied in proper time, it was transferred to the commissioners. Afterwards, however, a person came forward, and claimed to be Stewart's representative; and it would be for the jury to determine how far the prisoners had aided and assisted in thus falsely re-transferring the stock from the commissioners into the name of a person claiming to be Miss Stewart, but who, it had since been discovered, had falsely assumed that name. The learned Baron then minutely recapitulated the evidence which had been produced, so far as it had a bearing upon the various acts of the respective prisoners, and commented upon the points as they referred to Barber, Fletcher, or Dorey. On reading the evidence of one witness, in which he appeared to think that he had seen Barber, but was not quite sure of it, the learned Judge told the Jury that it was too slight to be relied on. In referring to the indictment as to the age of the person representing herself to be Miss Stewart, it was certainly an important point for the consideration of the Jury, because if she were only forty or fifty, it proved that that could not be the decrepit old woman who, it had been stated, had originally given instructions in this affair to Barber, and was so far in favour of Barber not having knowingly produced a wrong person; and he thought it to be important to remark, that when Barber was applied to in reference to the mistake in a wrong payment of 3*l.* 3*s.* 9*d.*, he at once, and without hesitation, gave the right address of the presumed Miss Stewart, which did not appear as if he was anxious to keep back the parties who had been connected with him in this affair. The learned Baron then referred to the confession of Mrs. Dorey, and said that the Jury must carefully guard against any portion of that statement being allowed to weigh upon their minds, as it regarded either Fletcher or Barber, and he should rely upon their good sense that they would distinguish upon this most important point; but the Jury could not but recollect that Mrs. Dorey's part in this transaction was, to say the least of it, a most improper one, for she well knew that by her means it was intended to get into the possession of Fletcher a sum of money, to which, she was well aware, he was not entitled. In conclusion, Baron Gurney said it was for the Jury to consider what part each of the prisoners at the bar took in the transaction; and said, that as regards Barber, who was a professional man, it should be recollected that a witness had said he gave the name of Clarence Peckham, but he had given his right residence in Nelson-square, and had invited the witness to visit him; and he had clearly established that his visit was in June, which was a fact of importance, as he was charged as an accessory before the fact; and the bond was sworn to after this period. It had been alleged that a mistake was made by witness as to the time of that visit; and a bill was put into his hand, with the view of showing that the time when Barber visited him must have been in October following; and the jury must take that point into their serious consideration, because, if that be the fact, then there was no evidence as against Barber, he being charged with being an accessory before the fact, which he could not be if he did not visit Great Marlow till the latter month. If the evidence of Griffin were looked at, it would be seen that Barber remained in the outer office of Mr. Potts till the business was completed; and his frequent attendance at the Bank, as the attorney for the parties, was certainly quite regular and professional, so far as that attendance was considered by itself. Another point of importance was that, though a large sum of money had been obtained, yet it had not at all been shown that Barber was ever in possession of such a sum as might have been supposed to be his share in this fraudulent transaction; but, on the contrary, that he was comparatively a poor man, and that he never received more than was a regular professional payment for services of this description. In regard to Mrs. Dorey, he need not trouble the jury with any observations, because her confession had rendered that course quite unnecessary. Relative to the prisoner Fletcher, he had taken a very conspicuous part in this nefarious transaction, and the evidence admitted of no doubt whatever, as it applied to him, especially in regard to Mr. Christmas, a clerk in the Bank, whom Fletcher had corrupted to depart from his duty. If the jury were satisfied that Mrs. Dorey represented Miss Stewart, then it was clearly made out that both she and Fletcher were accessories before the fact; and all that had been said in the statement of that unfortunate woman was fully confirmed by the testimony of Griffin. He had now performed the task which had been allotted him; and if they believed the testimony in regard to Mrs. Dorey, she must be guilty; if they believed the evidence against Fletcher, they must return a verdict of guilty; but with respect to Barber, the only point that could criminate him was the fact of his going to Marlow; if that visit were in June, then he was guilty; but if his visit did not take place till October, then he must be acquitted; but these were points which must be left to the serious deliberation of the jury. The learned baron then concluded his summing up, which occupied three hours, after which the jury retired to consider their verdict, and while they were absent the Court withdrew for refreshment. The jury were only absent about fifteen minutes when they returned; the most intense anxiety was manifested, the prisoners being immediately replaced in the dock, all of whom looked most anxiously at the jury, who found William Henry Barber not guilty, Joshua Fletcher guilty, Georgiana Dorey, guilty.—On Tuesday, the same prisoners, *Mrs. Dorey*, *W. H. Barber*, and *Joshua Fletcher*, were placed at the bar with *William* and *Lydia Sanders*, charged with forging the will of Miss Anne Slack. As the details of this case are familiar to our readers, it is only necessary to state that the abstract of the indictment on which the prisoners were arraigned, set forth that in the year 1842 there was a sum of 3500*l.* consols lying in the name of Anne Slack, the dividends on which, not having been claimed for upwards of ten years, the entire had been conveyed to the commissioners for the reduction of the national debt. It then proceeded to charge a person unknown with forging a testamentary document purporting to be the last will and testament of Anne Slack, deceased, bequeathing the above sum of 3500*l.* consols to one Emma Slack, with intent to defraud Anne Slack; and the prisoners, Lydia Sanders, Barber, Fletcher, William Sanders, and Georgiana Dorey, as accessories before the fact to the said forgery. In the second count Lydia Sanders and W. H. Barber were charged with uttering the forged document, well knowing it to be forged, and the other prisoners with being accessories before the fact. The third and fourth counts were similar to the first and second, only charging the intent with being to defraud the Governor and Company of the Bank of England. The fifth and sixth were also similar, but laying the intent as being to defraud Charles Shaw Lefevre and others commissioners for the reduction of the national debt. There were other counts, charging William Henry Barber as principal in forging the before-named document, and the other prisoners with being accessories before the fact. Mr. Erle stated the case for the prosecution, and examined numerous witnesses to show that a clerk in the Bank of England, named Christmas, had means of knowing what stock remained unclaimed as regarded the dividends for ten years and upwards, and consequently what sums, and to whom they originally belonged, were about to be transferred to the credit of the commissioners for the reduction of the national debt: that in the autumn of 1842, Christmas informed the prisoner Fletcher that a sum of 3500*l.* stock, in the Three per Cent. Consols, standing in the name of Ann Slack, of South-street, Chelsea, spinster, was about to be transferred to the commissioners for the reduction of the national debt, as unclaimed for a term of ten years, and that Fletcher at once proceeded to make his arrangements to secure this sum with the assistance of the other prisoners; that more than a year before this Barber and Fletcher were co-operating together in respect to dividends due on stock; and that they were acquainted with one another and did business together previous to the commencement of Barber's transactions with Fletcher in his professional capacity. Miss Slack proved that the handwriting to the will was not hers, and that she had given no one authority to sign her name, and in fact had never made a will. The trial continued during the whole of Wednesday and Thursday, and did not conclude until last night. After Mr. Erle had been heard in reply to Mr. Wilkins and Mr. Greaves, on the part of the prisoners, Mr. Justice Williams summed up, and told the Jury to admit nothing for their consideration except what appeared in the evidence before them. They must discard everything which had been said by counsel on both sides, except so far as it was founded upon the evidence. The first thing he had to remark was, that there was no evidence at all as to the actual person who forged the will; but that did not dispose of the important case before them, for there was no doubt that the will was forged. As he referred to the evidence, he should make such observations upon it as he thought proper, but if the jury did not coincide with him as to their justness, they would of course disregard them. With regard to Lydia Sanders, the case against her rested a good deal on the testimony of the Nevilles, but there were two or three others who spoke of her with more or less certainty as being mixed up in the transaction. With regard to Barber, the main and pressing question for their consideration was, whether he had acted truly and solely as an attorney, fairly employed without any guilty knowledge of the will being forged. There was no doubt that it was Barber who tendered the will for probate. There was no question raised upon that point, but it was said that this and everything else which he did in the transaction was done as an attorney. It had been proved that he received 600*l*, and that he went away with it, but what he did with it afterwards nobody knows. Whether he returned it to the supposed owner, or whether he appropriated it to himself, they had no means of judging. That part of the case which required their most serious consideration was the negotiations which were carried on in the autumn of 1842. Who induced or directed Mr. Barber to write to Captain Foskett, they had no proof. He had certainly informed him that the subject on which he was inquiring was for the benefit of Miss Slack, for he asked whether she was a person of nerves strong enough to bear an addition of a large sum of money to her means. After the correspondence which had taken place between Mr. Barber and Capt. Foskett, it would be for them to consider whether Barber had not been the real person to whom the money belonged. The next thing they would consider was the conduct of Mr. Barber after this correspondence. The general result of the evidence of Mr. Freshfield and Capt. Foskett was to raise an inference against Mr. Barber, but whether it did so or not was for the consideration of the Jury. When the whole of the evidence and documents were before them, they would consider whether Mr. Barber was in such a position as would have led him to suppose that the will was a forgery. When Mr. Freshfield told him he was suspected, it was for them to say whether he ought not to have said that he was only an attorney in the case, and that he acted throughout for Fletcher. After some further observations, the learned Judge told them that, if the evidence was such as to leave a just and reasonable doubt on their minds, the prisoners should have the benefit; but if there was no doubt on their minds, they would give their verdict accordingly. He again begged of the jury not to regard any observations which were addressed to them, except so far as they were founded on the evidence. The question they had to consider with regard to the prisoner Barber was, whether he had merely acted as an ordinary attorney would act in the matter, or whether he had produced the will for probate, well knowing it to have been forged? The Jury then retired to consider their verdict. The prisoner, Barber, seemed to have retained his self-possession throughout the trial, frequently handing down notes to his counsel, till the close of the Judge's charge; he then appeared to become extremely agitated and nervous. After an absence of about an hour and twenty minutes, the Jury returned with a verdict of GUILTY AGAINST ALL THE PRISONERS, except Sanders, who had been acquitted at an early stage of the trial. Mr. Barber—I am not guilty, my Lord, and Mr. Fletcher here knows that I am not. The prisoners were then removed.

Murder.—Mary Furley, aged 36, married, was indicted for the wilful murder of her infant son, George Furley. The prisoner had been an inmate of the workhouse at Bethnal Green, where she complained she was separated from her two children. She left the workhouse, and for a while supported herself by shirt-making, at which she could earn only 1½*d.* each shirt. On the 20th March she was taken out of the canal, and the body of her younger child was observed to slip from her grasp. With some difficulty she was restored, but the child was quite dead. Her defence was that on that day she had been robbed of her trifling earnings, and had nothing but destitution before her and her children. The jury returned a verdict of Guilty. Mr. Justice Maule passed sentence of death, telling the prisoner to prepare herself for her fate, as he could hold out no hope of a commutation of the sentence.

Destruction of the brig Collina.—Wm. Read, a shipowner at Ipswich was charged with having incited and procured one Wm. Simpson feloniously and maliciously to cast away and destroy a certain vessel called the Collina, on the high sea, within the jurisdiction of the Admiralty of England and also of the Central Criminal Court, with intent to prejudice divers persons as part owners of or underwriters to the said vessel. There were several other counts in the indictment, in one of which the Captain of the vessel (Simpson) was named as the principal in the felony. The prosecution was instituted by the Alliance Marine Insurance Company, which refused to pay the insurance effected on the vessel, and brought this action in consequence of rumours that she had been wilfully destroyed. The trial lasted two days. Mr. Justice Maule in summing up pointed out various inconsistencies in the evidence as affecting the prisoner, and dwelt on the strong testimony to character which had been adduced in his favour. The jury almost immediately returned a verdict of Not Guilty. The prisoner Simpson, upon whose confession the previous case mainly depended, was then brought to the bar, and asked whether he had anything to say why judgment should not be passed upon him according to law? The prisoner replied—"I have spoken nothing but the truth." The judge told him he stood convicted, on his own confession, of a very heinous offence, and he much aggravated it by an attempt to implicate and jeopardise the lives of others. "You are either guilty of the crime of perjury, which is not so punishable as that of casting away a vessel, or you have in reality sunk the ship." Prisoner—"I did so, my Lord." Mr. Justice Maule—"Your case is one in which I can see no mitigating circumstances; the sentence of the Court, therefore, is, that you be transported for life.

BIRTHS.—10th inst., at Maida-hill, the lady of S. D. NICKLIN, Esq., of a daughter—11th inst., at Alderholt-park, Hants, Mrs. J. M. KEY, of a daughter—13th inst., in Curzon-street, Mrs. W. H. BRABANT, of a son—13th inst., at 249, Blackfriars-road, the wife of Mr. R. TEBBITT, surgeon, of twins, girls—13th inst., at her father's house, Ipswich, the lady of Major W. M. N. STURT, Bengal Army, of a son—13th inst., at Nottingham, the wife of C. F. GREGG, Esq., Enniskillen Dragoons, of a son—13th inst., in Devonshire-street, Portland-place, the wife of A. B. CHISHOLM, Esq., of a daughter—13th inst., at Nonesuch-park, Surrey, the lady of W. F. G. FARMER, Esq., of a daughter.

MARRIED.—9th inst., at St. Mary's, Bathwick, Bath, the Rev. G. L. HARVEY, rector of Yate, son of the late Sir Ludford Harvey, to PERSIS SCOTT NICHOLLS, only child of Captain Nicholls, formerly of the 3d Buffs—10th inst., at Tintagel, in the county of Cornwall, ANN E. C. S. BREE, daughter of the Rev. R. S. Bree, to the Rev. E. M. SANDYS—10th inst., at Warblington Church, Hants, the Rev. C. B. HENVILLE, Fellow of Winchester College, and rector of Hanble le Rice and Bursledon, near Southampton, to M. LIND MCARTHUR, daughter of Thos. Meik, M.D., many years physician to the garrison of Portsmouth, and widow of the late John McArthur, of Hayfield-lodge, Hampshire.

DIED.—29th March, at Rome, of gastric fever, J. C. MANLEY, Esq., eldest son of J. S. Manley, Esq., of Manley-hall, Staffordshire, aged 21—30th ult., at Malton Abbey, Yorkshire, C. SMITHSON, Esq., aged 40—3d inst., at Rome, after a week's illness, JANE ELIZABETH RAWSON, relict of the late Sir W. Rawson, and daughter of the late Colonel Rawson, of Belmont, county Wicklow—2d inst., at Rome, on her return from India, ANNE NICOLLS, the beloved wife of Lieutenant-General Sir Jasper Nicolls, K.C.B., aged 61—9th inst., at Hawley-square, Margate, MARY ANN BAKER, daughter of the late John Baker, Esq., aged 62—10th inst., at Ostend, CHARLOTTE CURRY, wife of E. T. Curry, Esq., her Majesty's Consul at that place—10th inst., at Woodlands, Manchester, ELIZ. HENRY, wife of Alex. Henry, Esq.—11th inst., at Gatcombe Rectory, Isle of Wight, the Rev. H. WORSLEY, D.D., rector of Gatcombe, Isle of Wight, and of Wolverton, Hants, aged 89—11th inst., at Edinburgh, after many years of suffering, in consequence of a wound received at the battle of Vittoria, Colonel WM. HAY, eldest son of the late General Sir James Hay, K.C.H., Colonel of the 2d Drag. Guards—11th inst., at Kibworth, Leicestershire, the Rev. WM. RICKETTS, rector of that parish, and late Fellow of Merton College, Oxford, aged 41; also at the same place, on the following day, his brother, C. M. RICKETTS, Esq., aged 51—12th inst., at Addiscombe-road, Croydon, Mr. W. B. LASHMAR, eldest son of the late William Lashmar, of Chiddingly, Sussex, aged 56—12th inst., RACHEL LOUISA REEVES, of Portland-street, Clapham-rd., third daughter of the late Rev. Jonathan Reeves, of West Ham, Essex, and sister of the late Rev. Jonathan Reeves, late Fellow of King's College, Cambridge—12th inst., at 14, Curzon-street, after a very short illness, ALEX. J. HOPE, the eldest son of G. W. Hope, Esq., M.P., aged 5 years—13th inst., at No. 7, Bloomsbury-square, C. H. LE BRETON, the infant son of P. H. Le Breton, Esq.—13th inst., A. MONRO, Esq., of Blackheath-park, aged 42—13th inst., of consumption, MARIANNE A. HARDY, second daughter of Mr. W. M. Hardy, of Fleet-street, London, aged 13 years and 7 months—14th inst., at Montague-place, Islington, SUSANNAH L. GROOM, the wife of Mr. Groom, of Aldersgate-street—In Hunter-street, the Rev. J. HEWLETT, B.D., rector of Hilgay, Norfolk, and formerly morning preacher at the Foundling Hospital—7th inst., at his seat, Port Lemon, county Westmeath, the Right Hon. LORD DE BLAQUIERE.

THE LATE MR. LOUDON.—The following Subscribers to the WORKS of the late MR. LOUDON have been obtained since making up the List which appeared in the *Gardeners' Chronicle* of Saturday last:—

ARBORETUM BRITANNICUM—10*l.*

Sir Charles Gordon, for the Highland and Agricultural Society of Scotland, Edinburgh.
The Archbishop of Canterbury.
Earl Cornwallis, Linton Park.

ENCYCLOPÆDIA OF TREES AND SHRUBS—50*s.*

Messrs. J. Veitch & Son, Exeter.
Mr. J. Bunting, Colchester.
Messrs. Hugh Low & Co., Clapton
Earl Bruce, Savernake Lodge.
Mr. Henry Burn, Gardener at Tottenham-park, Marlborough
Mr. W. Richardson, 1, Waterloo-place, Edinburgh.

HORTUS LIGNOSUS LONDINENSIS—7*s.* 6*d.*

The Rev. E. W. Stillingfleet, Hotham, near Howden.

THE SUBURBAN GARDENER—1*l.*

The Rev. E. W. Stillingfleet, Hotham, near Howden
The Duke of Sutherland.

THE SUBURBAN HORTICULTURIST—16*s.*

Messrs. James Veitch and Son, Exeter
Mr. Beaman, King-st., Covent-Garden
Lady Maria Finch, Boxley Abbey
The Rev. E. W. Stillingfleet, Hotham, near Howden.

REPTON'S LANDSCAPE GARDENING—*Plain*, 30*s.*

Mr. William Elliott, Kiplin, Catterick
Messrs. Hugh Low & Co., Clapton
The Rev. E. W. Stillingfleet, Hotham, near Howden.

ENCYCLOPÆDIA OF COTTAGE ARCHITECTURE—63*s.*

Mr. James Buchan, Abercairny, by Perth; the Supplement.

THE GARDENERS' MAGAZINE—9 vols., 9*l.* 17*s.*

The Duke of Sutherland; the vols. for 1835 to 1841 inclusive
Mr. G. Shiells, Erskine House, near Renfrew; the Nos. for Nov. and Dec., 1843, and the January No. for 1844.

List of Subscriptions received since the last announcement.

His Grace the Duke of Sutherland	£10	0	0	Miss Murray	£1	1	0

SUBSCRIPTIONS will be received by the Treasurer, JAMES COOK, Esq., 40, Mincing-lane, London; and by the following Bankers:—Messrs. GLYNN and Co., Lombard-street; SIR JOHN W. LUBBOCK, Bart., and Co., Mansion-house Street; and Messrs. COUTTS, Strand, London.

MOST IMPORTANT TO FARMERS AND GRAZIERS.

GIBBONS' DISINFECTING OINTMENT, a most effectual and perfect cure for Epidemic and Foot-rot in Sheep; also for Epidemic and Foul in Cows' Feet, and for the Grease and Thrush in Horses; prepared only by HENRY GIBBONS, Agricultural Chemist, Wolverhampton.

This Ointment effectually destroys the American grub on Fruit-trees. Sold by all respectable Druggists in Town and Country, in packets at 2*s.* 6*d.* each. Mr. William Bailey, Manufacturing Chemist, North Street, Wolverhampton, is appointed Sole Wholesale and Shipping Agent.

DRESS AND FROCK COATS.

DRESS COATS, Superfine Cloth, 27*s.*; extra quality, 35*s.* and 40*s.*; Imperial Saxony, 50*s.*; Frock Coats, Silk Facings, 30*s.* to 40*s.*, extra quality, Silk Velvet Collar, and Silk facings, 48*s.*; Saxony ditto, 55*s.*; Children's Silk Tunic and Hussar Suits, 30*s.*; Waistcoats, new patterns, 5*s.* 6*d.* to 10*s.* 6*d.*; Trousers, 6*s.* 6*d.* to 10*s.* 6*d.*; excellent Doeskin, 12*s.* to 16*s.*; Summer Coats, 6*s.* 6*d.* to 10*s.* 6*d.*; Chesterfield Over Coats, with Silk Collars and Cuffs, 15*s.* to 21*s.* The much approved new style, 21*s.* A suit of Black Cloth, 2*l.* 5*s.*; extra quality, 3*l.* 3*s.*; Imperial Saxony Suit, warranted to retain its colour, 4*l.* 4*s.*, at FISHER and Co.'s, Tailors, 31, King William Street, City, 10 doors from London Bridge.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, patronised by "HER MAJESTY," H. R. H. Prince ALBERT, the Royal Family, and the several Courts of Europe. A FRAGRANT WHITE POWDER, prepared from Oriental Herbs of inestimable virtue, for strengthening, preserving, and cleansing the teeth. It eradicates the factitious formation of tartar, and by the removal of that extraneous substance lends a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the Enamel, substituting for discolour and the aspect of impurity, the most pure and pearl-like whiteness; while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2*s.* 9*d.* per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus—A. ROWLAND and SON, 20, Hatton Garden, which is affixed to each BOX. Ask for ROWLAND'S ODONTO. Sold by them, and by Perfumers and Chemists.

*** All others are SPURIOUS IMITATIONS.

BERDOE'S SUPERIOR LIGHT WATERPROOF FROCKS for the present season.—An extensive variety of the above, in New and greatly improved materials (in lieu of the unsightly rubbish made by Slopsellers). Now ready, guaranteed to exclude any rain whatever, and confidently recommended to those who regard a respectable appearance, or wish to avoid disappointment and vexation. First-rate Clothing of every description upon the lowest terms possible, consistent with true economy and ultimate satisfaction.—W. BERDOE, TAILOR, WATERPROOFER, &c., 69, Cornhill (north side).

MECHI'S LADIES' AND GENTLEMEN'S DRESSING CASES, in Morocco, and Russia leather, rosewood, mahogany, and japan ware, in the greatest imaginable variety of patterns, and at prices from 25*s.* to 100 guineas. As Mechi Manufactures the cutlery, brushes, and fittings, under his immediate inspection, every reliance may be placed on the quality. Old desks and dressing cases repaired and refitted. A variety of writing and dressing cases combined. Mechi's stock of papier maché goods is the most superb in London. The tea-trays in particular are worthy the inspection of the ladies, and the economical may be suited as well as the luxurious.—Manufactory, 4, Leadenhall-street, London.

HAYMAKING SEASON.—Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.

BOTTLED PERRY.

TO BE DISPOSED OF, a limited quantity of HUFFCAPP and CLARET PERRY, at 17*s.* 6*d.* per dozen, including bottles. Payment expected on delivery.—Apply to Mr. JAMES FAIRHEAD, High-street, Evesham. About 30 dozen of SQUASH, and 18 dozen BARLAND PERRY, may be had by applying early.

TO BE LET, A BEAUTIFUL COUNTRY RESIDENCE, for from 6 to 12 months, with or without land, in a highly picturesque neighbourhood, and near to a good market-town; handsomely furnished, and possessing every convenience, with Entrance-lodge, capital Garden, and good Angling, with use of Library.—Direct to A. B., care of Mr. Denning, Jeweller, Coventry-street, London.

TO BE LET, Furnished, for one or two years, four miles from Hyde Park Corner, and near the river, a HOUSE, containing three sitting-rooms, five airy bed-rooms, with kitchen, wash-house, mangle-room, and other offices; stabling, coach-house, &c. Attached to it are a large and productive Fruit and Flower-garden, and a Meadow (about two acres in all), with a cow, poultry-yard, and poultry. Few houses so near town possess in so great a degree the advantages of a country residence.—For particulars apply to Mr. MADDOX, 25, Welbeck-street.

TO FLORISTS AND NURSERYMEN.

AN AUCTIONEER, practising in a most excellent neighbourhood within 20 miles of London, and having a good connexion, could dispose of advantageously, by Public Auction, the *superfluous Stock of a Florist*. Apply, in the first instance, by letter, to A.B., 186, Piccadilly.

A SINGLE BOTTLE OF BETTS'S PATENT BRANDY may now be obtained in a perfectly genuine state. This convenient arrangement for both vendor and purchaser, and their mutual security against deception, is effected by the use of BETTS'S PATENT METALLIC CAPSULE, made of pure and SOLID METAL, (not Tin Foil) which completely encloses the cork and mouth of the bottle, and is embossed with the words "BETTS'S PATENT BRANDY, 7, SMITHFIELD BARS," the *fac-simile* of which is engraved on a label affixed to each bottle.

In the present day it is impossible to produce anything new and useful without exciting the cupidity of imitators. Already attempts are made to mystify the identity of the original and genuine article, by foisting upon the public the contents of bottles having a Tin Foil covering, falsely denominated "a neat metallic capsule." J. T. BETTS & Co. therefore deem it essential to impress upon purchasers the absolute necessity of comparing the embossed Capsules with the Labels, as an infallible mode of detecting fraudulent substitutions.

BETTS'S PATENT BRANDY, thus protected, may be obtained of the undermentioned Wine and Spirit Merchants, at 3*s.* 6*d.* per Bottle, Bottles included; or at 18*s.* per Gallon, as heretofore, at

Bishopsgate Street	W. Stevens, Nos. 78 and 80.

Ditto	James Watson, 7, Great Chapel Street.
Westminster Road	Robert Shaw, 10, Gilbert Buildings.

KEENE'S PATENT MARBLE CEMENT.—This CEMENT is particularly adapted for the Walls and Floors of Conservatories and Greenhouses, being calculated, from its extreme hardness, to resist the wear incident to ordinary Plastering. For Floors it has a threefold advantage over Stone-paving. 1st, in its lightness; one inch in thickness of KEENE'S CEMENT sufficing where 2 to 3 inch flagging would be employed. Next, in its appearance, combining, as it does, the hardness of stone with a uniform colour and even surface free from joints; and lastly, in economy, being one-third the price of Portland paving.

The most conclusive evidence can be given of the utility of KEENE'S CEMENT for these purposes by the Patentees and Manufacturers.—JOHN BAZLEY WHITE and Sons, Millbank-street, Westminster.

WANTED, by a Gentleman's Gardener, where a Foreman is kept, a Person about 17 years of age, who has some knowledge of his profession, of good character and obliging manners, and not above his business, or it would be useless to attempt the situation. Wages, at present, 10*s.* per week, with lodging; but if he is suitable he will have an early advance. A moderate premium required.—Direct to A. X. Z., Post-office, Studley, Warwickshire.

TO MARKET GARDENERS.

WANTED, a PARTNER, in an Old-established and First-rate Business, in one of the most flourishing towns in the south of England. The qualifications necessary for this undertaking are, a thorough practical knowledge of Gardening in all its branches, some experience in the retail department, and a capital of from 800*l.* to 1000*l.* The Advertiser being obliged from the state of his health to relinquish a portion of the labour essential to the successful prosecution of the business, none but practical and active individuals need apply. Principals only will be treated with, and the most undoubted testimonials required. Further particulars may be learned on application by letter only to X. Y. Z., care of Messrs. WOODWARD and CASTLE, Bull-head Court, Newgate-street.

WANT PLACES.—All Letters to be post-paid.

AS FOREMAN.—The Father of a Young Man aged 21, (under whom he has been living these 6 years) is desirous of placing him as Foreman in some extensive establishment, under an experienced Head-Gardener. He is well acquainted with the duties of the profession; wages no object; the only wish being the extension of his practical knowledge; or a small premium would be willingly given for corresponding experience. The highest testimonials can be given as to respectability, perseverance, sobriety, &c.—Direct to J. W. N., care of Mr. Knight, Exotic Nursery, King's-road, Chelsea.

TO NOBLEMEN AND GENTLEMEN.

AS HEAD-GARDENER.—A Married Man, aged 36; has a thorough knowledge of his profession in all its branches, having served as head in two families of distinction in Scotland, and at present in an extensive situation in England; has had a deal of practice in forcing of every description, and likewise in planning and laying of Pleasure-grounds, Flower-gardens, &c. &c.; can produce a certificate from the Curator of the Edinburgh Botanical Garden, and testimonials from the Noblemen and Gentlemen he has served, which will stand the strictest investigation. No objection to act as Forester or Bailiff. Direct M. Z., at Mr. CAMERON'S, Curator, Botanic Garden, Birmingham.

AS GARDENER.—A young Man who has a Practical knowledge of the culture of the Pine and Vine, and of the general routine of the Kitchen and Flower Garden; he has been nearly two years in the situation he has just left.—Direct to P. J., care of Mr. Thomas, Wrotham-park, Barnet, Herts.

AS GARDENER.—A married Man, 33 years of age, a native of Scotland, who is well acquainted with Horticulture and Floriculture in all its various branches, on the most improved principles, and can be well recommended by a Nobleman with whom he lived about 4½ years.—Direct to N. W., at Messrs. Ronald's Nursery, New Brentford, Middlesex.

AS GARDENER.—A single Man, aged 30, who thoroughly understands his business in all its branches, and can be highly recommended by his employer, with whom he has lived seven years.—Direct to T. T., Post-office, Hampton Wick, Middlesex.

AS GARDENER.—A married Man, 34 years of age, without encumbrance; can be well recommended by his late employer, whom he has served five years; has had extensive practical experience (on both sides of the Tweed), in every department of Gardening; has a good knowledge of Arboriculture, and is conversant with accounts. Direct to A. B. C., 85, Park Street, Grosvenor Square, London.

AS GARDENER.—A married Man, aged 30 years, without family, who perfectly understands his business in all its branches, with land and stock, if required. Can have near Five years' character from his late employer, with the highest testimonials as to abilities from previous employers.—Direct A. B., care of Mr. GRAY, Weston Gardens, Chertsey, Surrey.

AS GARDENER.—JOHN STEVENSON, Gardener, Lambton Castle, Durham, is desirous of obtaining for a young man a place as above, J. S. having known him for the last seventeen years, and therefore can confidently recommend him as competent and trustworthy; he is married, and aged 30.

AS GARDENER.—A respectable married Man, without incumbrance, 37 years of age, who understands his business in every department, and the care of a Farm should it be required, and his Wife have the care of Dairy and Poultry, or Laundry, should it be required. Can have a four years' character from the Gentleman they have just left, and seven years' from the former.—Direct to J. B., Mr. HARSLETT, Dairyman, 4, Duke-street, Grosvenor-square, London.

AS GARDENER.—An industrious married Man, aged 30, who perfectly understands Pine Growing and Early Forcing in general; also Plants and the Flower and Kitchen-Garden. An undeniable character can be given.—Direct to J. D., Messrs. FAIRBAIRN'S, Nurserymen, Clapham, Surrey.

AS SHOPMAN.—A respectable young Man wishes to obtain a Situation in a Seed-shop or Nursery; he thoroughly understands his business in all its Branches, can have seven years' unexceptionable Character from the place he has recently left, and Security if required.—Direct to T. B., Mr. Andrieu, 1, St. James's Place, Westmoreland Road, Walworth.

TO SEEDSMEN.

AS ASSISTANT in a SEED-SHOP.—A respectable young Man, who can make himself generally useful. He has been engaged for a length of time in a London Seed-Shop, and has a thorough knowledge of the Seed business. References can be given as to character and ability.—Direct to A. B., Messrs. Hurst and M'Mullen, Seedsmen, 9, Leadenhall-street, London.

A LADY who is obliged to part with her GARDENER is anxious to recommend him to any Lady or Gentleman, as a valuable servant. He is very skilful, both in the Kitchen and Flower-Garden; is careful in preserving his own seeds, and propagating from his own Plants, and perfectly well understands Forcing Cucumbers, &c. He can drive, and is willing to take charge of a carriage, with either one or two horses. He is a married man, without children: and his Wife would take charge of a Lodge. The Lady who sends this Advertisement will gladly answer every inquiry.—Direct, post-paid, to G. B., Post-office, Tunbridge Wells.

TO AGRICULTURISTS.

AS WHEELER, JOINER, and CARPENTER.—A young Man who has had 10 years' experience in the above capacities in one of the first Agricultural districts of the north, and has been some time in England, is desirous of engaging on reasonable terms with a Landholder or Agriculturist; he is perfectly competent as a maker of Scotch Carts and other implements of husbandry used in that part of the country. Reference as to qualification, sobriety, and integrity, may be had on application to A. B., at the Coffee-house, Chertsey, Surrey.

TO NOBLEMEN, GENTLEMEN, LANDED PROPRIETORS, AND GENERAL ESTATE AGENTS.

THE ADVERTISER is desirous of obtaining a Situation as the RESIDENT MANAGER OF AN ESTATE. Security can be obtained to any amount, and references can be given which are unquestionable.—Direct, T. O. 115, Mr. Mellard's, Bookseller, Stourbridge, Worcestershire.

HEARTSEASE SOCIETY.—Under the Patronage of Sir J. SEBRIGHT, Bart.

The next EXHIBITION of the above Society is appointed to take place on WEDNESDAY, 15th of May next, at the "Thatched House" Inn, Hammersmith, when Prizes will be given on the same liberal scale as heretofore. It is requested that Exhibitors will have their Stands painted *Green*, and the Committee beg to suggest a *Pea Green* as being the best.

For further Particulars, please to apply to Mr. MOUNTJOY, Hon. Sec., Nursery, Ealing, Middlesex.—April 22.

TUNBRIDGE WELLS HORTICULTURAL SOCIETY, 1844.—There will be FOUR EXHIBITIONS during the present year, viz., the first on Friday, May the 24th; the second on Friday, June 28th; the third on Friday, August 2d; the fourth on Friday, September 13th.—WM. MADDOCK, Hon. Sec.

WARNER AND WARNER, SEEDSMEN, 28, Cornhill, London, beg to inform their Friends they can supply all the new varieties of Fuchsia, Petunia, Verbena, Calceolaria, Geranium, Dahlia, &c. &c. now out, either in Collections or by the single plant.

Plants of the New Black Nemophylla, 9*d*. each. Potter's Liquid Guano, in quart bottles, 1*s*. 9*d*. each. Super-phosphate of Lime, in 7lb. packets, at 1*s*. each. Whitney's Chemical Transparent Waterproof Composition, with directions for use; in pints, 2*s*. 6*d*. each, quarts, 4*s*. 6*d*. each.

For their Advertisements of new and choice Flower and Vegetable Seeds, see their lists in Harrison's "Cabinet" for April, and the preceding Numbers of the *Gardeners' Chronicle*.

Petunia Punctata is now ready for sending out, 7*s*. 6*d*. each.

NOW SENDING OUT,

PETUNIA PUNCTATA.—Although the orders for this excellent Plant have been most numerous, a few strong healthy Plants remain yet unbespoke; 7*s*. 6*d*. each plant, postage free.

W. MILLER, Ramsgate.

DAHLIAS.—SPARY'S "LADY ANTROBUS" and "AURANTIA."

E. SPARY begs respectfully to inform the Trade, and Florists in general, that he has a fine healthy stock of the above now ready for delivery—with the select new and old varieties.—Hungerford, April 26, 1844.

CHOICE PANSIES.

J. HENCHMAN begs to inform cultivators of the PANSY that he is now sending out healthy plants of six good seedling varieties, for 21*s*. the set. Also a few choice kinds at 15*s*. and 18*s*. per dozen.—Edmonton, April 1844.

NEW HARDY ANNUAL.

VISCARIA OCULATA—DARK-EYED VISCARIA.

T. AND J. BACKHOUSE, NURSERY AND SEEDSMEN, York, have the pleasure of offering to the Public the above new and beautiful Annual, which is figured at page 53, (No. 10, of the "Botanical Register" for 1843. The blossoms are of a bright rose-colour, with a deep crimson eye, and changing to a pale purple. It flowers very abundantly through the greater part of the summer and autumn. It is a native of Algiers, and may be sown either in the open ground in spring, or raised in pots and planted out.

Packets, 2*s*. 6*d*. each, will be sent, on the receipt of a Post-office order, postage free, to any part of the Kingdom.

PELARGONIUMS, AURICULAS, CARNATIONS, AND LILIUM LANCIFOLIUM.

H. GROOM, Clapham Rise, near London (removed from Walworth), by APPOINTMENT FLORIST TO HER MAJESTY, begs to inform the Nobility, Gentry, and Amateurs, that in consequence of the success he has had in the cultivation of the above Flowers at his new Garden (where he requests an inspection of the quality of his plants), he can offer them at very moderate prices. His Catalogue of PELARGONIUMS, AURICULAS, and NEW PLANTS, is now ready, and will be forwarded by post on application. The Trade supplied.

T. ANSELL has purchased the DAHLIA "PRIMULETT'S PERFECTION," colour dark purple, shown at Bedford in September, 1842, which took the first seedling prize; and at Hitchin, 1843, in the best stand of 12—the only places where shown for competition. Price of plants, third week in May, 10*s*. 6*d*. each.

T. A. regrets that the Dahlias previously advertised by him having done so badly he cannot receive any further orders for them until the time above mentioned,—viz., the third week in May.—Camden Nursery, Camden Town.

FUCHSIA DICKENS.

J. INGRAM, NURSERYMAN, Southampton, begs to offer the above-named unique FUCHSIA at 7*s*. 6*d*. each, with an allowance to the Trade if three or more are taken. Its character is that of Formosa elegans, but far excels it in point of size, colour, and general habit. Should it not turn out as described, no charge shall be made.

J. INGRAM, 9, Above-Bar Street.

PANSY, "LADY ALICE PEEL."—In every respect one of the best Show-Flowers of the present year; raised by Youell & Co. in 1843. Blooms were submitted for the opinion of the Editor of the *Gardeners' Chronicle*, a description of which will be found under "Notices to Correspondents," in last week's Paper, page 248.

Strong plants are now ready for sending out, post-free, at 3*s*. 6*d*. per plant.—Great Yarmouth Nursery, April 25th.

NEW HOLLAND SEEDS.

H. C. CORSTEN, SEEDSMAN, &c., Centre-row, Hungerford Market, has just received a box of the above Seeds, with Specimens, in collections of 1*l*. and 2*l*. May also be had of H. CORSTEN, Florist, &c., 19 A, Davies-street, Berkeley-sq.

NEW FUCHSIAS.

JOHN SMITH, NURSERYMAN, Dalston, begs to announce that he intends sending out, the second week in May, the following fine and showy FUCHSIAS, good plants in pots, at the prices named, viz.:—Albion, 5*s*.; Coronet, 7*s*. 6*d*.; Expansa, 7*s*. 6*d*., Coccinea vera, 5*s*.; Decora, 7*s*. 6*d*.; Gigantea, 10*s*. 6*d*.; Hector, 5*s*.; Incarnata, 5*s*.; Modesta, 5*s*.; Neptune, 5*s*.; Reflexa, 5*s*.; Vesta, 10*s*. 6*d*.—A descriptive list may be had, on application at the Nursery, Dalston, or at his shop, Covent Garden. The price of the collection. 3*l*. 10*s*.—April 27th.

CHOICE PANSIES, NEW FUCHSIAS, VERBENAS, &c.

JOSEPH FRYER begs to remind his Friends and the Public that he can still supply good healthy Plants of most of the leading varieties of Pansies, from 1*s*. to 2*s*. 6*d*. each; and fine varieties, by name, from 6*s*. to 9*s*. per dozen (if left to J. F.'s selection); likewise the finest varieties of New Fuchsias, from 12*s*. to 18*s*. per dozen; and good showy varieties, from 6*s*. to 9*s*. per dozen; good sorts of Verbenas, 4*s*. per dozen; and new varieties, 6*s*. to 9*s*. per dozen.

J. F. likewise begs to offer his "Thunbergia Fryerii," which was so highly recommended by the writers in the *Gardeners' Chronicle* last season, and is figured in the "Florists' Journal" for December last; good plants, 2*s*. 6*d*. each, with trade allowance when three or more are taken. Also a few more packets of the seed can be supplied at 2*s*. 6*d*. and 5*s*. each; and a limited portion of choice Pansy-seed, at 1*s*. and 2*s*. 6*d*. per packet. Any of the above will be sent post-free, or carefully packed in small hampers if preferred.

N.B.—Agent for Potter's Guano and Humphreys's Compound.—Clarendon Nursery, Camberwell, London, April 26th.

SLOUGH NURSERY, NEAR WINDSOR,
CHOICE SELECTION OF NEW DAHLIAS, 1844.

THOMAS BROWN directs attention to his beautiful SEEDLINGS, particularly that unrivalled light flower, "LADY ST. MAUR," the superiority of which over every other of its class is too well known to need further comment. Strong and healthy plants will be ready for delivery early in May.

AURANTIA (Spary's)—Orange buff; fine form and petal. A very desirable show flower; obtained numerous prizes; 3 ft.	10*s*	6*d*
ALEXANDER (Brown's)—Maroon and crimson mottled; full and constant, centre well up, and a very useful show flower; 5 ft.	7	6
DELIGHT (Brown's)—Cream, veined and tipped with purple; petal of fine substance and high centre; very distinct to any in cultivation; 4 ft.	7	6
DESIRABLE (Brown's)—Shaded buff, quite new in colour; a good show flower; 5 ft.	7	6
LADY ST. MAUR (Brown's)—White, delicately tipped with violet purple; very deep and full, high centre, forming a beautiful outline; the petals are round, and smooth at the edge; habit of Perpetual Grand: it is decidedly the finest light flower ever offered. It attracted great admiration at Windsor, and was universally acknowledged to be the finest flower in the Exhibition; 4 to 5 ft.	15	0
NUTWITH (Brown's)—Bright crimson; a fine open-cupped petal, and a good show flower; 4 ft.	7	6
RAPHAEL (Brown's)—Dark maroon, beautifully shaded with light crimson; superior petal, of excellent form: a very novel and striking variety, and will be an acquisition to any stand; 4 ft.	10	6
REMBRANDT (Brown's)—Dark purple, very round and double, rising well in the centre, and a constant show flower. It was very successfully exhibited; 3 to 4 ft.	10	6
EMMA NOKE (Dowding's)—Blush white, good general form and centre: a good useful show flower; 4 ft.	10	6
ESSEX BRIDE (Turville's)—Delicate peach lilac, of excellent petal and form; 5 ft. (*no discount*)	10	6
LADY ANTROBUS (Spary's)—White and lilac, mottled; good form, constant, and very useful show flower; 3 ft.	10	6
NONPAREIL (Proctor's)—Ruby scarlet, of first-rate properties; extra show flower; 4 ft. (*no discount*)	10	6
STANDARD OF PERFECTION (Keynes')—Crimson; of very superior form; 4 ft. (*no discount*)	10	6
SIR J. STEWART RICHARDSON (Union)—Brown ruby, great depth, and excellent show flower; 4 ft. (*no discount*)	10	6

T. B. has also Selections of fine Carnations, Picotees, and all other Florists' Flowers; Plants, Fruit-trees, Shrubs, and general Nursery Stock.

A general Catalogue of Dahlias, with a List of Superb New Pansies, to be had on application.

MESSRS. MARNOCK and MANLEY beg to inform their Friends and the Public, that their DESCRIPTIVE CATALOGUE OF FUCHSIAS, VERBENAS, CINERARIAS, DAHLIAS, &c., with a Treatise on the best and most successful Modes of Cultivation, is now ready, and may be had on application.

N.B.—Their beautiful Fuchsia, MARNOCK'S PRINCESS SOPHIA, is now ready to be sent out; the stock is not large, therefore early orders will prevent disappointment.

Messrs. Hurst and M'Mullen are Agents for their Fuchsias and Cinerarias. Nursery, Hackney, April 26, 1844.

NURSERIES, SAWBRIDGEWORTH, HERTS, EQUIDISTANT FROM THE HARLOW AND SAWBRIDGEWORTH STATIONS. ON THE NORTHERN AND EASTERN RAILWAY.

NEW ROSES.

T. RIVERS, JUN., has now to offer healthy Plants, which will bloom this season, of the new hybrid perpetual Rose, LA REINE. These are grafted in pits on stocks of the Rose Manettii, and may be planted out with safety towards the end of the month. This large and splendid Rose has bloomed at Sawbridgeworth, and is undoubtedly one of the finest autumnal Roses known, colour brilliant Rose, very slightly tinged with Lilac; in size it is larger than William Jesse, very double, most perfectly cupped, highly fragrant, and opens freely. Plants, 15*s*. each, package included. Also a few plants of the new climbing Rose, Queen, or Beauty of the Prairies, a variety of Rose Rubifolia, from North America, perfectly hardy. This has also bloomed with T. R., Jun.; colour bright Rosy red, flowers large as those of the Crimson Boursault, very double; and, unlike most climbing Roses, it has thick enduring petals. Plants, 7*s*. 6*d*. each. *Carriage paid to London.*

Other new Roses will be ready for delivery early in May. In consequence of the frequent complaints made of Roses in pots being crushed when packed in baskets, by heavy weights being placed on them in the railway trucks, they will in future be sent from the Sawbridgeworth Nursery, packed in wooden cases.—April 26, 1844.

SUPERB SEEDLING DAHLIAS TO BE SENT OUT FIRST WEEK IN MAY.

GAINES'S "PRINCESS ALICE,"—Pure white, very full centre, the petals finely cupped; was considered by all who saw it growing the best White Dahlia; gained several prizes; a good show-flower, 4 ft., 10*s*. 6*d*.

GAINES'S TWICKENHAM RIVAL.—Fine yellow, occasionally tipped with red; a superb round thick petal, fine circular form; the best yellow yet offered to the public; gained several prizes; a good show-flower, 4 ft., 10*s*. 6*d*.

GAINES'S COUNTESS OF ZETLAND.—Blush, tipped with lilac; fine round thick petals; a good show-flower, 4 ft., 10*s*. 6*d*.

GAINES'S ENTERPRIZE.—Crimson purple, a superb show-flower, 4 ft., 10*s*. 9*d*.

A List of Dahlias, Pelargoniums, Pansies, Calceolarias, Fuchsias, Verbenas, Auriculas, Cinerarias, Chrysanthemums, &c., containing many New Seedlings of first-rate qualities, may be had by application at the Nursery, Surrey-lane, Battersea.

HURST & M'MULLEN, SEEDSMEN and FLORISTS, 6, Leadenhall-street, London, have a few packets left of the following very choice FLOWER-SEEDS, which they can recommend as particularly adapted for being sown at the present time.

Anagallis grandiflora (new), flowers as large a crown-piece. See description in the *Gardeners' Chronicle*, pp. 461 and 488.	Lychnis fulgens
	Lobelia ramosus
	,, erinioides
	Martynia fragrans
	Portulacca, three varieties
	Primula sinensis, new var.
	Pink, from a very fine collection
	Schypanthus elegans
	Thunbergia, fine varieties
	Tropæolum tricolorum
	,, pentaphyllum
Campanula stricta	
Erica andromedæflora	
Fuchsias, saved from best vars.	
Gloxinia, fine mixed	
Ipomœa Horsfallii	
,, rubro-cærulea	
pomopsis elegans	

H. and M'M. are Agents for the sale of Mr. Miller's (of Ramsgate), Petunia Punctata, new Verbenas, Fuchsias, &c., &c.; Mr. Day's (of Oxford), new Fuchsias; Mr. Pullen's (of Midhurst), Fuchsia Adonis; Messrs. Rogers and Sons (Uttoxeter), Aquilegia grandiflora; and Messrs. Marnock and Manley's new Cineraria. All the new Fuchsias, Dahlias, Verbenas, Pansies, &c., at advertised prices.

Agents for Humphreys's celebrated Compound and new Manure for Agricultural purposes; Potter's Liquid Guano; Dr. Hallett's Liquid Fertiliser; Whitney's Waterproof Composition for Frames, &c.

Seeds carefully selected and packed for foreign orders.

MAY'S "QUEEN OF MAY" CINERARIA.—The above new and beautiful Cineraria is now ready to be sent out by post, or otherwise, at 5*s*. 6*d*. each, including case, prepaid. It is confidently recommended as being one of the most splendid novelties that has been offered in Cinerarias: the colour being a beautiful light sky-blue; the flowers large and of good form; the plants compact, shrubby, and dwarf in growth—may be had of the principal Nurserymen in the kingdom.

W. M. begs to state that his descriptive List of new, superb Calceolarias may be had on application to WILLIAM MAY, Hope Nursery, Bedale, Yorkshire.

W. M. also begs to intimate that he cannot supply any more Eucharidium grandiflorum.

CHESHUNT NURSERIES, HERTS.—NEW ROSES.

A. PAUL AND SON, in submitting the following varieties of NEW ROSES beg to remark that the plants are well established, and can be so packed as to travel with perfect safety to any distance.

Hybrid Perpetual—	La Reine	15*s*.	0*d*.
,, ,,	Baron Prevost	3	6
,, ,,	Lady Elphinstone	10	6
,, ,,	Madame Dumeme	5	0
,, ,,	Earl Talbot	2	6

Bourbon—	Virgil	5	0
,,	Imperatrice Josephine	7	6
,,	Delille (new)	5	0
Moss—	Rosinella	15	0
Austrian Persian Yellow		5	0

These and every other really valuable variety known are now ready.

A Post-office order on the Waltham-cross Post-office, or reference, respectfully requested from unknown correspondents.

N.B.—All packages forwarded to London free of carriage.

GRASS SEEDS.

HENRY D. CORMACK, SEEDSMAN, &c., begs to inform Agriculturists in general that they can be supplied with every variety of the Natural Grasses, adapted to the soil, properly apportioned and combined, from his Wholesale and Retail Seed Warehouse, 106, Dean's-gate, Manchester.

SUPERIOR NEW SWEDISH TURNIPS.

WARNER AND WARNER, SEEDSMEN, 28, Cornhill, London, beg to introduce to their Friends the following New Swedish Turnips, which for their general good qualities stand unrivalled; growing to a large size, being small in the top, of a dark yellow flesh, and may be grown as close to each other as a Stone or Stubble Turnip.

WARNER'S RUSSIAN SWEDE . . 2s. 6d. per lb.
WARNER'S EMPEROR SWEDE . . 2s. 6d. per lb.

Also WARNER'S Purple-top Yellow Hybrid, 2s. 6d. per lb., with all the varieties of Norfolk and Tankards, of the most genuine and selected stocks, from 9d. to 1s. per lb.

MESSRS. J. and H. BROWN, respectfully offer to the Nobility and Gentry the following Plants for Bedding Out, &c.

The above Plants carefully packed and forwarded to any part of the United Kingdom. A post-office Order or reference for payment in Town. Persons erecting Greenhouses or Conservatories can be well supplied with the choicest and best of Plants for furnishing, including the many handsome Climbers recently introduced.

N. B.—Plants securely packed for exportation.—Albion Nursery, Stoke Newington, London.

SKIRVING'S IMPROVED SWEDE TURNIP.

W. SKIRVING, SEEDSMAN, Queen-square, Liverpool, begs to acquaint his Agricultural Friends and the Public, that the price for the present season of the Genuine Seed of his improved Swede Turnip is 1s. 6d. per lb.; the sort warranted the same as that for which he received the Premium of the Royal Agricultural Society of England. All other sorts of Turnip-seeds of the common kinds at the usual prices; also the most approved varieties of Mangold Wurzel, large White Belgian and Altringham Carrot.

For permanent Pasture, W. SKIRVING begs to offer his Selection of the most useful Perennial Grass-seeds. The sorts selected from personal observation of the growth and habits of the different Grasses grown in his experimental Grounds at Walton. On this system he has supplied within a few years, Seeds for many thousand acres, which have given every satisfaction. Orders stating quantity and quality of land to be laid down, will be correctly executed, with a suitable mixture.

For alternate Cropping, W. S. can recommend Seed of pure Italian Rye-grass, grown and carefully saved on his own farm.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, Hothouse Builders, &c., Gloucester-place, Chelsea, beg to inform Horticulturists that they have made great improvements in their excellent and simple plan of Shading, whereby the largest or smallest can be instantly covered or uncovered with a sheet of canvas. To be seen in use at most of the London Nurseries, and at the Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

TO FARMERS AND THE TRADE.—

Large White Agricultural Carrot .	45s. per cwt.
Long Red Mangold Wurzel . .	60s. per cwt.
Globe Yellow ditto ditto . .	75s. per cwt.
Globe Red ditto ditto . .	70s. per cwt.
Field Turnips in variety.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

SECOND EDITION FOR 1844.

YOUELL AND CO.,

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN; HIS MAJESTY THE KING OF THE BELGIANS; NURSERYMEN AND FLORISTS BY SPECIAL APPOINTMENT TO HER MAJESTY THE QUEEN DOWAGER.

A SELECT CATALOGUE of the NEWEST and VERY BEST VARIETIES OF

FUCHSIAS, VERBENAS, PETUNIAS, CHRYSANTHEMUMS, & ANAGALLIS offered by YOUELL & Co.

YOUELL & Co., in submitting their Catalogue of FUCHSIAS for 1844, take the present opportunity of drawing the attention of admirers of the above elegant tribe of plants, to their select and superb Collection. They have spared no expense in forming a selection of such as are really good, to the exclusion of many that are mere nominal varieties; and they would refer to the numerous testimonials of success which attended their mode of selecting, last season, collections for Amateurs, for competition at the various Horticultural Exhibitions throughout the kingdom.

YOUELL & Co. being the parties who first sent out per post, with safety, these tribes of plants, are desirous of calling attention to their advantageous method of executing orders, namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, upon the following terms:—

12 Extra Fine varieties, 12s., the Selection left to Youell & Co.
12 ditto ditto 21s., the Selection left to the Purchaser.
50 Fine varieties . . 40s., the Selection left to Youell & Co.
50 Extra Fine ditto . 60s., the Selection left to the Purchaser.
With the exception of those marked thus*.

The plants are strong and healthy, and now ready for delivery, with the exception of those marked thus**, which will be ready the beginning of May: thus ensuring to the Purchaser fine plants for competition in the ensuing season. Many of the varieties can be supplied now.

NEW AND SPLENDID SEEDLING FUCHSIAS.

* "FUCHSIA LINDLEYANA." This brilliant Fuchsia, the entire stock of which is in the possession of YOUELL & Co., is now for the first time offered to the notice of the public.

Its exceedingly large tube and sepals are of the most vivid vermilion, and excessively expansive, surpassing in brilliancy any hybrid that has yet been raised. It was exhibited at the London Horticultural Society's Meeting, Regent-street, and greatly admired, and was pronounced by all who saw YOUELL & Co.'s specimen plant to be the most dazzling object of this tribe they ever witnessed. The foliage and habit exceedingly fine, a most abundant bloomer, and will be found a desideratum to every collection. Plants are ready for delivery, at 7s. 6d. per plant. Usual discount to the Trade, when not less than six plants are ordered.

* "QUEEN VICTORIA." Tube and sepals smooth, of a bright vermilion, corolla stout, long, of a fine purple rose colour, forming a good contrast, and of fine texture, price 7s. 6d. per plant.

* "PRINCE OF WALES." Tube and sepals rosy vermilion, the latter tipped with green, expanding well, and showing a fine corolla of maroon purple; price 7s. 6d. per plant.

* "PRINCESS ROYAL." Tube and sepals bright red, corolla large and peculiarly bright in colour; price 5s. per plant.

* "MARCHIONESS OF NORMANBY." This is a large and showy flower, measuring four inches from the commencement of the pod to the termination of the pistil, tube and sepals scarlet, corolla stout, having a tinge of purple on it; price 7s. 6d. per plant.

* "LADY ALICE PEEL." A flower of good form and substance, fine rosy red tube and sepals, the latter terminating in a decided green, corolla very large and stout, of a beautiful crimson purple; price 5s. per plant.

* "LADY WALSINGHAM." Tube and sepals smooth, of a rosy vermilion; the latter turn up, and expose the whole of the corolla, which is stout, and of a fine purple crimson; price 5s. per plant. When the six are ordered, they will be charged 1l. 11s. 6d. the set.

**"FUCHSIA QUEEN." Quite new, very beautiful, and not yet out, tube and sepals large and stout, of pure white, showing a dark crimson corolla; price 10s. 6d. per plant. [No discount allowed upon this variety.]

Fuchsia Seed, saved from the best varieties, 6s. to 10s. per packet, with directions for sowing, &c. &c.

N.B.—With every other new variety worthy of cultivation, that may be advertised by other parties after the publication of this list.

VERBENAS.

*"MONARCH" (Youell's) is a delicate creamy white, surpassing in its size and fragrance every other variety; the tufts of bloom measuring from 3½ to 4 inches diameter, and will be sure to give satisfaction. Price 5s. per plant.

* "BRILLIANT," (Youell's). This fine variety is of the most vivid scarlet, equal in this respect to "Melindris;" the bloom, however, is three times the size, and very fragrant, and will prove most desirable in any collection. Price 3s. 6d. per plant.

* "ELEGANS" (Youell's), is a most interesting variety, being a delicate lilac, with a distinct white eye; flower large and fragrant. Price 3s. 6d. per plant.

* "SURPRISE" (Youell's), can be recommended as a variety completely novel, and one that must be cultivated in every collection, the colour being of the richest rosy crimson, or ruby, producing tufts of flowers of 3½ ins. in diameter, and delightfully fragrant. Price 5s. per plant.

The above four varieties have been selected from upwards of 2000 Seedlings, and may be confidently relied upon as possessing superior claims, and will be sure to give satisfaction; are now ready to send out (post-free). If the four varieties are taken, they will be charged 15s. the set.

FINEST CARNATIONS AND PICOTEES.

YOUELL AND Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Extensive List, with Prices, of the above highly esteemed Flowers, which appeared on the Advertising pages, 706 and 707, of this Paper, of October the 14th, and will be found to contain every variety worthy of cultivation.

Prices as follows:	£	s.	d.
12 pair of good Show Sorts . . .	1	4	0
12 ditto fine ditto . . .	1	10	0
25 ditto ditto . . .	3	0	0
12 ditto extra fine and very superior ditto .	2	10	0
25 ditto ditto . . . ditto	5	0	0

The selection being left to YOUELL & Co.

ARAUCARIA IMBRICATA IN POTS.

Recently planted most extensively at Her Majesty's Gardens at Windsor, and also at the Royal Gardens, Claremont, furnished by YOUELL and Co.

YOUELL AND Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 10 inches high, 10l. per 100, or 30s. per dozen.

Fine Plants of CEDRUS DEODARA, in Pots, 2ft. to 2ft. 8 ins., 10s. 6d. each.

FLOWER-SEEDS.—30 Packets of the choicest and newest kinds sent per post free for 6s.

N.B. All Orders above £2 are delivered carriage free to London or Hull, or plants added to compensate for the same.

Great Yarmouth Nursery, April 25, 1844.

Sales by Auction.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to public competition, at the Auction Mart, Bartholomew-lane, on TUESDAY, April 30, and THURSDAY, May 2, 1844, at 12 o'clock each day, a fine collection of DAHLIAS, comprising all the new and leading varieties. Also a splendid assortment of GERANIUMS, in bloom; the newest varieties of FUCHSIAS and VERBENAS, and a variety of other flowering Plants. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

HORTICULTURAL SOCIETY OF LONDON.—EXHIBITIONS AT THE GARDEN.—The First Meeting will take place on SATURDAY the 18th of May; subjects for Exhibition must be at this Office on Friday the 17th; or at the Garden before half past Eight o'clock A.M., on the day of Exhibition.

Exhibitors will be provided with a printed form in which they will state, for the information of the Judges, whether their plants, &c., have been shown previously during the Season. The gates will be open at One P.M. Tickets are issued to Fellows at this Office, price 5s. each; or at the Garden, in the afternoon of the days of Exhibition, at 7s. 6d. each; but only to orders from Fellows of the Society.

N.B. No Tickets will be issued in Regent Street on the day of Exhibition.—21, Regent Street.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—EXHIBITIONS of PLANTS, FLOWERS, and MICROSCOPES in the Garden of this Society, for 1844.

TUESDAY, April 30.
TUESDAY, June 4.
TUESDAY, July 2, 1844.

When Prizes exceeding 900*l.* will be competed for, Fellows and Members, and the bearers of Ivory Tickets, will be admitted upon entering their names in the Gate-book.

Visitors may obtain Tickets at 5s. each, except on the days of Exhibition, when they will be 7s. 6d. each, by orders from Fellows and Members of the Society only.

The Gates to be opened at 2 o'clock. CARRIAGES to enter the Inner Circle of the Park by the road opposite the York Gate, to set down in front of the principal Gate of the Gardens, and to take up at the Gate opposite the road leading to Chester-terrace. Should the weather prove wet, a NEW GATE connected with the Tents will be opened.

Tickets and further particulars at the Gardens.

By order of the Council, J. D. C. SOWERBY, Sec.

The Gardeners' Chronicle.

SATURDAY, APRIL 27, 1844.

		Society of Arts	8 P.M.
FRIDAY,	May 3	Botanical	8 P.M.
MONDAY,	May 6	Entomological	8 P.M.
TUESDAY,	May 7	Horticultural	3 P.M.
		Linnean	8 P.M.

IT is the indefeasible privilege of a British subject to be plundered. If a clause to that effect was not inserted in the Bill of Rights, it was only because it is clear and universally admitted. The thing is indeed so natural, and the craving for the privilege so strong, that people will cheat themselves rather than not be cheated at all. It is, no doubt, upon some such point as this that the clever gentlemen who live upon the public satisfy their consciences.

It may be said that when a man is eager to be cheated he sanctions the cheat; that the verb passive includes the verb active, and that "to be done" implies "to do." If a man will procure for himself the pleasure of being robbed, it seems necessary that some kind person should take on himself the office of robber. No wonder, then, that when a gardener or farmer signifies his taste for being plundered by cheating himself of half the manure his garden or farm can make, others should minister to his fancy by cheating him also with that which he purchases. And it must be confessed that we have no lack of volunteers for so agreeable an undertaking. Indeed, the eagerness to pluck the poor cultivator is such, that we wonder he should have a feather left to line his nest with.

A memorable instance of these doings was mentioned the other night by Mr. Edward Solly, at the Royal Institution, during a lecture which we have reported elsewhere. Having procured from a manufacturer a certain manure, he objected to its colour and general appearance, and expressed his doubts of its being genuine. "Oh!" said the seller, "it is not quite pure, but it is *good enough for Agricultural purposes.*" Upon which it was analysed, when it was discovered that the impurities (foreign matter,) amounted to NINETY-SEVEN PER CENT! so that, in the opinion of the seller on this occasion, if a manure is genuine to the extent of 3 lbs. in a hundred it is good enough for a gardener or farmer.

To be sure it is rather expensive to purchase materials at this rate; but, on the other hand, it is extremely convenient to sell them. One man's loss is another man's gain; and besides, farmers and gardeners are not the people to find out the trick; which is an additional comfort to tender consciences.

But to be serious; for this is a very serious matter. Let us compare the selling price of some of the common articles of consumption, with their real price when adulterated to this enormous extent. Rough phosphate of ammonia is quoted at 3*d.* per lb.; but as only 3 lbs. in each 100 lbs. would be genuine, of course the true price paid for it would be 8*s.* 4*d.* per lb.; nitrate of soda sold at 2*d.* per lb. would cost about 5*s.* 6*d.*; and sal ammoniac bought at 6*d.* per lb. would stand the consumer in just 16*s.* 8*d.* Or let us suppose that an acre of land is known to require 4 cwt. of guano, or 20 bushels of bone-dust, or 5 cwt. of superphosphate of lime; the nominal expense of such dressings would be only 2*l.*, but the cultivator, in order to get them, would have to buy about 6 *tons and a half of guano, or* 82 *quarters of bone-dust, or* 8 *tons of superphosphate of lime,* AT THE EXPENSE OF 66*l.* INSTEAD OF 40*s.*

Now is not this monstrous? Is it not an evil, as compared with which all others shrink into insignificance? For manure is the foundation of the prosperity of the cultivator of the soil, and no amount of capital, skill, or prudence, nor any happy succession of good seasons, can supply its place. The market-gardener cannot grow his Cabbages, Asparagus and Lettuces any more than the farmer his Wheat and Turnips, without an abundant supply of this invaluable material; and, skill and soil being alike, the amount of productiveness must of necessity be regulated by the amount of manure at a man's command.

Yet some of the dealers in this substance have the audacity to declare that although what they sell is adulterated to the extent of 97 parts in 100, still it is "good enough for a farmer." In examining some of the samples of manure that have been occasionally sent us, we have been amazed, not more at the impudence of the sellers than at the extraordinary credulity of the buyers. Clay, lime, and a small quantity of smelling salts form an artificial guano; pounded straw and dry loam make Peruvian guano; lime-rubbish, and a small quantity of bone-siftings form bone-dust; dirty rock-salt does for nitrate of soda to a great extent; and even soot is enormously doctored with cinder-siftings. However, in the opinion of the sellers, they are "good enough for farmers and gardeners."

Let us not be misunderstood in this matter. Let us not be supposed to insinuate that all the dealers in manures are rogues; on the contrary, there are among them most respectable men, who are above all suspicion. The facts, however, that have been mentioned are notorious, and sufficiently prove that fraud does exist in the manure trade to a disgraceful extent.

A remedy for this state of things is of the most urgent necessity. Our correspondents cry out loudly to *us* for assistance, as if *we* had the power to redress such grievances. We must, however, tell them plainly, that the remedy lies with *themselves*, and with no one else. We may occasionally give a little help; but to check such an evil is beyond the means of a newspaper. The sale of genuine Peruvian guano last year, by one house alone, amounted to a hundred thousand pounds, and by another to sixty-five thousand pounds. The temptation to a fraudulent participation in such a traffic is so great, that nothing except the good sense of buyers can arrest it. It is in vain to say "Deal only with persons of known respectability;" for the immediate reply is, "Who are those persons?" and that is a question to which, for obvious reasons, no public journalist has the right to reply; the utmost that he can do is to warn people against yielding to the seduction of cheapness, or the temptation of low prices at auctions, got up by nobody knows whom.

There is, however, a remedy within all men's reach, to which we can without impropriety direct attention, and that is, the employment of Chemical Analysis. It is true that people cannot have recourse to this of themselves, because they, in general, want the apparatus, skill, and knowledge required to conduct it. But the country is full of young men whose chemical dexterity is quite sufficient to obtain at least such a rough analysis as will protect a buyer against enormous fraud. The payment of a moderate fee to them would secure their advice. Or, as Mr. Hyett, of Painswick, has recommended, and Mr. Gyde proposed, Farmers' Clubs might give some neighbouring chemist a retaining fee, in consideration of which he would undertake to perform analyses for the Members of the Club at certain small rates of remuneration. Besides which, our advertising columns show that persons are to be found both able and willing to apply their knowledge to this kind of investigation. The utility of this is obvious. Suppose, for instance, a dealer offers guano for sale; if the farmer, before buying a ton of it, pays a chemist 10*s.* for analysing a sample, and finds it of bad quality, although he may lose the ten shillings, yet he will avoid laying out ten pounds upon a material whose only recommendation is its being "good enough for a farmer." In the same way gentlemen might authorise their gardeners to consult the lecturers at Mechanics' Institutions, and thus save themselves many a pound, and much more loss and vexation.

For ourselves, we entertain no doubt that this is the true and only mode of opposing fraud on the part of dealers in manures; and we are perfectly convinced that, if it were once carried generally into effect, the difficulty of putting off adulterated articles would be such as to render the risk greater than the profit; and that would be the end of the system.

AMONG the other EXPERIMENTS now in progress in the GARDEN OF THE HORTICULTURAL SOCIETY are several with heating contrivances, the result of which may now be examined with advantage. The principal of these are, an iron tank apparatus, by Burbidge and Healy, for air-warmth; several sorts of boilers, by different persons; hot-water gutters in a Vinery; bottom-heat obtained in an Orchidaceous house, and elsewhere, by the same means; and bottom-heat derived from iron gutters roofed over with thick drain-pipes split, and converted into arches.

The endless inquiries that are made of us concerning the value of the various modifications of the tank-system now in use are best answered by a reference to what is going on in the Society's Garden, to which all Fellows and their friends have daily access, except on Sundays. For the information of those who may not have an opportunity of visiting the Gardens, we may state that the operation of the tank-system, in all its forms, is most satisfactory up to the present time, wherever both dampness and warmth are wanted. In an iron Vinery, the health of the foliage of Vines, Kidney Beans, Figs, and Psidium Cattleyanum, cannot be exceeded; and Strawberries have ripened their fruit well. It is, however, still to be ascertained how far the dampness of the tanks can be advantageously counteracted when Grapes and Figs are ripening.

As the season is now at hand when HORTICULTURAL EXHIBITIONS will be again held all over the country, we should be obliged by our readers informing us whether or not they are of opinion that the publication of the proceedings at the Country Shows is of any real utility. We have been very often advised to leave them out; and have as often replied that although their publication is attended with some inconvenience and great expense, yet that we are willing to go on with them so long as they gratify the parties concerned.

We are again urged to discontinue them. One of our most able correspondents writes thus:—

"What I dislike very much in your Paper is the account of Provincial Flower Shows, with the Prizes awarded; I never read them, nor can I learn that any one else does in this neighbourhood. They merely increase the bulk of the book when bound up at the end of the year. I except, however, the account of Exhibitions in London and Chiswick. Depend on it you would be more popular by omitting altogether the Provincial Flower Exhibitions."

It is impossible for us in London to judge correctly how far persons in the country, where the Shows take place, participate in these opinions, which we trust will induce our correspondents to express their views very generally. We shall leave the matter in their hands, and form our own decision as to the utility of reporting the Country Shows, by the number and bearing of the letters on the subject, which we may receive during the next fortnight.

THE SWAN.

IT may be interesting to some of your numerous readers to have one more testimony added to those you have already chronicled, in regard of the useful and ornamental character of these noble birds, and that too of a very curious and interesting trait in their habits and manners; and as the hint, at this particular season, may more easily be put to the test, and prove more useful than at any other, I deferred sending it till the March winds should waste the icy barrier from the lakes, and let the Swan go free to show his character.

There are several pieces of water within the inclosure in these gardens, to which the Swans on the lakes have no access; and in the spring of 1840 these waters, within the rabbit-proof fence, and every walk and avenue in their vicinity, was croaked and crawled over with thousands of full-grown toads, and a thin sprinkling of frogs. Seeing this nuisance, I began to think of getting them collected, well knowing that the refuse of fish—to which they bore a strong resemblance—makes an excellent manure; and on that score I thought the carcass would pay for the catching and killing, and by preventing their spawning would abate the nuisance, if not prevent it for the future.

However, on examining the larger pieces of water without the fence in the open pleasure-ground, where I expected the toads had taken up their "head-quarters," I was disappointed, and found their encampments there very few and far between. Seeing this, I began to think that some other cause than a partiality for the picturesque must have induced them to prefer a pond in an inclosed garden, to an open lake outside the fence; and, judging from the array, that such a regiment could not have been mustered in a space of less than a mile circuit, and as much of this mile must have been over land extremely uneven, I could not comprehend the reason why they did not prefer the nearest pond, after travelling such a long and weary way. One morning, however, I had the matter cleared up very satisfactorily, and found that though they had perhaps in the first instance pitched their tents in the nearest pool, the fear of enemies had made them resume their pilgrimage; and though many of them had certainly "come from afar off," they must yet go still farther and find some quiet place, secluded or inclosed, where Swans come not to claim superiority; for there I found, on the open lake, a Swan giving battle to the toads in good earnest, curing the plague by attacking the enemy on the water, chacing them from place to place as fast as oar and sail could steer, and ever and anon the arched neck and bill, armed like a pair of pincers, descended with unerring grapple on the foe; and in one or two places where they had skulked under some branches for safety, he had dragged them out, and not only killed them, but cast them on the bank out of the water, as if he were aware that their remains would corrupt the watery region where he reigned. Now, though the frogs were no doubt acceptable to the Swan as an article of food, he would not eat the toads; and this leads me to infer that his killing

them wantonly, and to such an extent, may be a feature in his instinct and economy, intended by Nature to keep this class of crawling vermin in check by constituting the Swan their natural enemy,—an office for which he seems eminently qualified, although to all appearance but indifferently rewarded. Besides clearing the lakes of toads, &c., I find that Swans shear the grass on the brink, and thus keep it short and neat; and, woe to any aquatics, whether weeds or not, that the strong bill of a Swan can either rend or root up; this noble bird may therefore be regarded as an industrious dresser and keeper of his domain; and whoever has not already banished the frogs and toads, will be glad to hear of so effectual a remedy for this plague as the Swan undoubtedly is; for he seems animated with such a hatred of all vermin, and so determined to drive them either to death or banishment, as has not been seen since the days of St. Patrick. In Laughton's "Guide to the Isle of Man," I see that "Mona's Isle," as well as Erin, is said to have been cleared of this species of vermin by the agency of that celebrated missionary; and the following humorous quotation is given as a sample of the manner in which the laudable deed is handed down to posterity:—

"Success to bold St. Patrick's fist—
He was the Saint so clever—
He gave the snakes and toads a twist,
And banished them for ever.
There's not a mile in Erin's isle where nasty varmint musters,
Where'er he put his blessed foot he murthered them in clusters.
The frogs went hop, the toads went plop, slap dash into the water,
The bastes committed suicide to save themselves from slaughter."

Whilst on this subject I cannot help alluding to the painful practice of pinioning young Swans, by cutting a piece of the flesh of the wing off to prevent their flying. The poor cripple thus mutilated may look like a Swan, but can give no idea of the nobler movements and truly majestic character of that fine bird on the wing and on the water, in the enjoyment of his native liberty. Surely some one will be found humane enough to advocate the cause of the Swans, and induce their keepers to refrain from this barbarous practice, and rather delight to see them in their true and perfect character.

Notwithstanding all the tenderness that Swans show to their young in infancy, when the cygnets are nearly a year old, the old cock begins to give battle to his sons, and makes them take to flight. On one of these occasions, when a cygnet had been obliged to flee away, I saw him coming home to his father soaring in circuitous lines through the haze of gray mist, that made him appear much larger and altogether so changed from the simple cygnet he used to look on the water, that I began to think if gentlemen so much admire the dignified animation that pinioned Swans confer on ornamental water, what would they not feel who have a taste for the sublime, to see these noble birds perfect and free, coming in the clouds of heaven as silently and softly as the flakes of snow.—*A. Forsyth, Alton Towers.*

FAMILIAR BOTANY.

Morphology.—No. XII.

The penetrative sun,
His force deep darting to the dark retreat
Of vegetation, sets the steaming power
At large, to wander o'er the verdant earth,
In various hues, but chiefly thee, gay green!
Thou smiling Nature's universal robe!
United light and shade! where the sight dwells
With growing strength and ever-new delight.
——— The juicy groves
Put forth their buds, unfolding by degrees,
Till the whole leafy forest stands displayed
In full luxuriance to the sighing gales.

Before proceeding with a demonstration of the conversion of leaves into the parts of a flower, it will be as well to pause, in order to show another curious change that comes over the organs of plants during their growth, by means of which an apparatus, quite as little like the leaf as the gayest corolla, is plainly proved to be nevertheless no more than metamorphosed foliage.

Evidence of this kind meets us at every step, now that all Nature is struggling once more into active life, and that the wondrous powers of organisation are exerting their force with the most prodigal luxuriance. When the ruin of winter is repaired by the magic hand of spring, the first movement of life that is perceptible among plants is the swelling of their buds, just as the first step towards repose was connected with the formation of those curious organs.

A bud at rest is but a dingy lifeless thing—a point on the surface of a branch—a speck that none but a botanist would know to be pregnant with life. But when it begins to move and be animated with the throes of nature, it swells, divides into scales, and by slow degrees is the mother of a branch. To watch how this happens is most instructive. Take the Horse-Chesnut for examination.

The bud of the Horse-Chesnut, like all buds, consists of hard, dry plates, having no more resemblance to the great fingered leaves of the trees than the scale of a soldier's epaulette to his cuirass. If we cut a bud open during winter, we find these plates all alike in form and structure; but the interior softer and greener than the exterior. When, however, the growth commences, the centre swells and forces the plates asunder. Then the outermost, hard, thin, and dry, retain their first form without change; the next become a little thinner and greener; then follow plates growing at their base and becoming quite green; to which succeed others so green, and thin, and large, that they could not be known to be transformed plates, if a portion of the original brownness did not still adhere to their points. And this is the first stage of change. The hard, dry plates of the bud are gradually metamorphosed into pale green straps.

But the current of change is onward, onward. The force of Nature, once aroused, can no longer be checked; imperfection changes with rapid and resistless energy to perfection. The pale green straps lengthen, and become hairy; others are longer, narrower, and more hairy; a third stage, and they are shaggy with wool, and furnished at their points with a deep green appendage or two. The second stage of change approaches; the fingered leaf is begun.

Then arrive more rapid metamorphoses. Just above the plates of the last degree, long narrow, shaggy, and bearing an appendage at their points, come parts still narrower, with more of a leaf at the end; and then, by a further contraction of the first-born plate and enlargement of the last-born leaf, the foliage appears in all its completeness.

No man in his senses can deny that this curious series of changes from a hard dry brown plate to a large succulent green fingered leaf has been so gradual as to prove, to the most rigorous demonstration, that the whole series of parts consists of the same organ in different stages; and consequently the winter plates in which a leaf-bud is encased, as in defensive armour, are really nothing more than leaves in an incomplete condition.

What is true of one leaf-bud is true of all others; and consequently all leaf-buds are composed of rudimentary leaves. If that is so, why should not a flower be formed on the same plan? And now for the proofs of that.—*R. E.*

VERMIN.

As it is of great importance to Gardeners and Agriculturists to have vermin destroyed, and as I have been successful in this, I wish to communicate the methods I follow. I am not aware that I have either a rat or mouse in my house or garden, and sparrows are so much diminished in numbers that my currants hang on the bushes until late in the autumn.

Against the rats I have employed the bricklayer, who has spoiled all their runs with brick and mortar, consequently they have left me. With regard to mice, I keep two traps; one under cover in my garden and another in my garret, baited with oatmeal. These traps catch the first mouse in the manner of a rat-box trap; other mice then enter in by two little falling doors which allow a passage only inwards. This kind of trap requires good workmanship in the making, and hard wood, to prevent the mice gnawing a way out.

The best kind of Mouse-trap.
Door, 3¼ inches wide; Top, 8½ inches square; Height, 3 inches.

Trap for Tomtits and Green Linnets.—Green Linnets are fond of Hemp-seed.

As to birds, by far the most mischievous to the gardener is the bulfinch, as its only food in spring is fruit-buds. All gardeners and orchard-owners should keep a male and a female bulfinch and two trap-cages. With this apparatus other bulfinches are easily taken. Tomtits are next in mischief. They are most readily caught in cages having a weight or spring to the door, which shuts as the bird enters. Bait with fat or oats, or both. In June I have a long plank raised from the ground, with narrow edging on each side to keep the food from falling down or blowing away. The plank is 40 feet from some thick bushes, behind which a person fires a gun when the board is covered with sparrows. My gardener has killed as many as thirty at one shot. The plank must of course be in a line with the gun.

In order to keep down wasps in spring I purchase of poor children the large females, by which practice I find fewer nests of this troublesome insect in the autumn. In catching vermin in traps, the first lesson to be taught is, that they should have free ingress and egress until all acquire a confidence. Many more will be caught this way than if the traps were continually set.—*Drewen.*

MEXICAN PINES.

The following statement of the present condition of some of the Mexican Pines growing at Bayfordbury (Herts), has been delayed in order that I might the better show how far they appear to be uninjured by the late winter, during which they have remained without any protection. It will be seen that Pinus oocarpa, and P. leiophylla were both killed in 1842, and P. pseudo-strobus much injured in 1843, having all its young shoots killed.

MEXICAN PINUS AT BAYFORDBURY.

Planted in 1841.	Total Height.	Year's Growth.	Spread of branches	Girth of Stem.	Observations.
	ft.in	ft.in.	ft.in	in.	
Pinus patula	6 8	1842..3 9 1843..2 2	6 3	7	Unprotected and uninjured.
P. apulcensis	5 2	1842..2 3 1843..2 5	4 8	8	Do. do.
P. Teocote	4 5	1842..2 4 1843..1 9	3 11	7	Do. do.
P. Hartwegii	1 1	1843..0 6	1 2	6	Do. do., apparently will be very hardy
P. macrophylla	2 3	1843..1 10	1 6	4	Do. do, apparently very hardy, and promising to be very fine, with leaves 10 inches in length.
P. Devoniana	1 10	1843..1 4	1 4	7	Do. do., length of leaves, 1ft. 6in.
P. Russelliana	1 10	1843..1 2	1 7	6	Do. do., length of leaves, 1 ft.
P. Montezumæ	3 7	1843..1 3	4 0	7	Do. do., length of leaves, 10 in.

GRAFTED PINUS AT BAYFORDBURY.

Name of Graft.	Name and height of Stock.	Date of Grafting	Year's Shoot.	Total Height.	Observations.
			1843 ft.in	1843 ft.	
Pinus macrocarpa	P. Laricio, 2 ft.	June 1840.	1 9	7	
P. Sabiniana	P. Laricio, 2 ft.	June 1840.	1 10	6	
P. Lambertiana	P. sylvestris, 4 ft.	May 1842.	2 7	—	Girth of graft, 5 ins. Four shoots were grafted besides the leader, producing in all 18 branches.
P. Lambertiana	P. strobus, 4 ft. 6 in.	May 1842.	2 0	—	Girth of graft, 4 ins.
P. Montezumæ	P. sylvestris, 11 ft. 6 in.	June 1842.	1 10	—	
P. insignis	P. sylvestris, 4 ft.	June 1842.	2 8	—	
P. insignis	P. sylvestris, 9 ft.	June 1843.	—	—	The leader and lateral shoots of the stock were grafted with 27 grafts on it, all taken well, and grown from 4 in. to 8 in. the same season.
Ten distinct species.	P. sylvestris, 12 ft.	May 1843.	—	—	All of which are doing well. It will have a curious effect.

These plants were raised from seed sent out by the Horticultural Society in 1840, and when planted out in 1841 were not more than from two to four inches high. I have not seen any of the Mexican Pines in any collection approaching to such vigour of growth.

I would particularly call attention to the method of grafting Pines after the manner spoken of by Mr. Loudon, in his "Arboretum Britannicum," in which I have been very successful; some of my specimens may, I think, deserve notice, as being not only very good examples of the success of the system, but as producing shoots of a length and size which I have not seen in others of the same species. I allude to the two Pinus Lambertianas, in which species I have never seen such vigour of growth among the few seedling plants existing in this country. I have also found P. insignis make vigorous shoots, and take more freely than any other which I have tried, growing the same season that it is grafted some inches, which but few of the others are inclined to do. I have grafted most of the hardy species, and find Pinus sylvestris more suitable as a stock than any other for Pinus; Abies excelsa for Abies, and A. Picea for Piceas. The ten distinct species grafted on the same plant of Pinus sylvestris are doing well, and will have a curious and perhaps beautiful effect.

I grafted many species on stocks from 10 feet to 12 feet high, in various places about the park, all of which are promising to make fine trees. By this system of grafting,

a Pinetum of grafted specimens could easily be formed, and at a trifling expense, supposing any one to have a plantation of Scotch, Spruce, and Silver Firs, which might be grafted at various heights, choosing regular distances.

I have found the best time for commencing this operation to be, when both the shoots of the stock and species which you intend to graft, are as brittle as the top of a young Asparagus, which is generally about the middle or latter end of May. But this depends much upon the season. At the time of my proceeding to graft, I endeavour to choose a stock in a suitable situation, where there would be no occasion to remove it after grafting. I break off the top of the stock, and split it down about an inch and a half; then choosing a scion of equal size to the stock, and cutting it very smooth into the shape of a wedge, I insert it into the stock, leaving it an inch above, and tying it neatly as far as the incision was made, grafting both the leading and uppermost lateral shoots. In about fifteen or sixteen days, you may tell if it has taken; and at the end of a month, or five weeks, the tying may be loosened, as the stock will swell fast, and if allowed to remain, would prove injurious to both stock and scion. I have always found it needful to preserve the scions from withering, by keeping them in a little moist grass, or moss, during the time of operating, for which I prefer the morning, evening, or dull days. The branches of the stock should not be pruned off, but only shortened where they grow too vigorously. The Pinetum here is a space of ground of nearly seven acres, adjoining to the Arboretum, on a light sandy loam, facing the south-west, with many fine specimens of Pinus insignis, P. macrocarpa, P. sabiniana, and Abies deodara, from 8 ft. to 11 ft. and 12 ft. high, which are in a most promising condition. In no one instance has there been any preparation made for any of the specimens, beyond a good digging in the ordinary way of planting.—*John Slowe, Gardener to W. R. A. Baker, Esq., Bayfordbury, Herts.*

Home Correspondence.

Morphology.—There are those who deny that in the development of plants those parts which, under certain circumstances, become expanded in the form of leaves, admit of being developed in a different character, viz., as flowers, and as fruit, if the circumstances affecting that development are changed in due time and in the requisite degree. They seem to assume that flowers are pre-organised in the embryo plant, and therefore are developed as a matter of course (a woman's reason—because it is so) as the plant extends its growth. That the production of flowers and fruit, the "seed after its kind," is indeed provided for, in the designs of the Infinite, cannot be doubted; but as those designs are ever carried on by means of natural agencies, there is no atheism or infidelity in believing that circumstances are ordained to exercise influence over the development of plants, and thus to bring about their fructification: neither is there anything unreasonable in such a view, inasmuch as there is an overwhelming mass of natural evidence to prove it; whilst, on the other hand, to assume that these parts are each and all formed in the embryo, and are uninfluenced in their development by the circumstances in which they are placed, is to take up a position which is directly at variance with all natural evidence. It appears to be sufficiently clear that "what would be leaves under certain conditions of growth, would be flowers if those conditions were changed soon enough, and the requisite conditions supplied;" and yet there are those who profess to deny this. As the attention of gardeners has of late been directed to this subject, it would certainly be interesting to those who desire to arrive at the truth, to try a simple experiment, directly bearing on the case. Let two young plants of the same kind (Salvia splendens, for example) be taken, as nearly alike as possible; that is, of equal age and height, having an equal number of leaves of equal size; let their equality be further established by selecting them of equal weight, when the soil is carefully and entirely washed from their roots: let one of these be taken and potted, and let it be placed in a close, moist, deeply-shaded atmosphere, warmed to a few degrees above that to which the plant is naturally adapted; in this situation let it be continued, and assisted in its growth by the application of all the stimulants, except light, which, within the limitation of reason, it may be possible to apply to it; let the other plant be potted in similar soil, and placed in a genial atmosphere, duly regulated with respect to temperature; and in this situation let it, too, receive all the stimulants, including light, which can minister to its growth. The results in both cases should be carefully noted; and though the trial is an easy task, the results would afford strong evidence whether or not "what would be leaves, under certain conditions of growth, would be flowers if the conditions of growth were suitably varied;" and, consequently, whether or not this part, at least, of Morphology is truth or falsehood.—*T. Moore.*

Strawberries.—I have lately seen some very fine forced Strawberries (Keen's Seedling) at Willan-hall, East Barnet; there was probably not less than a thousand pots of them in the Pine-house. The plants were nearly all in full bearing; they had a fine appearance, as the shelves were so regulated that each line of pots was seen distinctly from one end of the house to the other. The number of fruit on each plant was from 18 to 30, and many of them weighed more than half-an-ounce. The gardener, Mr. Halley, attaches great importance to procuring the plants from those that were forced the previous spring. This he can always do, as he invariably turns the forced plants out into the open ground soon after they have done bearing. He says that plants so treated produce excellent runners, and bear an abundant crop late in the season.—*A Visitor.*

Birds' Eggs.—Waterton's plan of preserving birds' eggs, mentioned at p. 245, cannot be improved on so far as relates to the interior of the egg. If the outside is varnished twice with isinglass, dissolved in gin, the pores of the shell will be closed, and the colour, in a great measure, preserved. The shining properties of the varnish disappear in a few hours, and leave the egg quite natural in appearance, which is not the case with mastic varnish. —*A. C., Leeds.*

Birds.—Would any of your correspondents describe the various notes of the small birds which are now to be heard in all directions. The skylark, blackbird, nightingale, robin and missel-thrush are generally known, but there are many which I cannot discover. What is the bird known provincially as the cuckoo's mate, or cuckoo's harbinger? Bewick does not mention it under that name.—*X.*

Rabbits.—A few miles from the place where I was brought up, a gentleman had a herd of deer, which he allowed to wander about wherever they liked. This greatly annoyed his tenants and neighbours, and, like the gentleman of whom your correspondent "*" complains, he was deaf to all entreaties to kill or park them up; he told all who complained, that if the deer came into their fields they were to lay hold of them, and he would pay for every one that they caught. An old farmer accordingly set to work: he fastened a long rope to the door of an old barn that stood at some distance from the rest of his houses; he then strewed the floor with hay, and also laid some outside, and in a day or two the whole herd paid him a visit. It was winter, and the ground being covered with snow, the loose hay attracted them to the place; they soon eat up all that lay outside, and a good many of them ventured inside: the farmer then shut the door by pulling the rope, and kept them there until the gentleman came and paid dearly for them. If your correspondent will inclose a small space with hurdles, opposite the grounds from which the rabbits enter, then, like the old farmer, fasten a long rope to the gate, so that he may shut it at pleasure, and if he will scatter some Cabbage-leaves, or anything of which rabbits are fond, inside and near the gate of the inclosure, there will be plenty in before 11 o'clock at night, when he may shut the gate. If he leaves it longer they perhaps will have finished the prog and have gone out in search of more. Another plan, equally successful, is, in place of having a gate, have a number of holes all round the inclosure; inside of each of these set a snare, and lay something down that is eatable, to tempt the rabbits to go in. They like to work among fresh earth, and if some parts of the inclosure are dug up with a spade, the temptation will be double. If your correspondent perseveres in this way for a short time, I imagine that his neighbour will become tired of breeding rabbits for him to destroy, and will either destroy them himself, or try to keep them at home. I observe that "J." recommends the use of arsenic for the purpose of killing rabbits; but that might be attended with dangerous consequences, for possibly some poor person might find some of the poisoned rabbits and eat them. In my opinion poison ought never to be used for killing vermin, until all other methods have failed, because there is always danger of poisoning something else.—*J. W., Derbyshire.*

Bees.—These are now collecting quantities of farina and a small portion of honey. The population of strong hives is rapidly increasing. Bell-glasses for flat-topped hives should now be cleaned and made ready for that purpose. Let every glass contain a small piece of the whitest of last year's comb. This should be attached to a thin lath, about one inch wide, which should be fitted into the hole at the top of the glass, extending downward its whole depth. The comb should be fixed upon the farther end of this. By warming the edge of the comb and lath with a lighted candle or hot iron, they will readily adhere. Be careful to place the glasses directly over the centre of the holes, which should be one and a half inch in size in the top of the hive, letting the lath and comb unite to the apertures of communication. As the population increases and the weather becomes warmer, they will soon cluster upon the comb, and commence filling the glasses. Great care must be taken to exclude all light and cold from the glasses, which must be protected by a cover, without a top, made with pasteboard or floor-cloth, of sufficient size to cover all the glasses. Fill the spaces between them and the cover with black cotton wool or wadding, in order to exclude light and cold air from the glasses. By following these directions failure will seldom occur, provided the season is favourable for collecting honey. Quantities of from 2 lbs. to 2½ lbs. are oftentimes gathered during the day; this is of the purest quality.—*W. Savage, Swaffham.*

Insects of the Damson-tree.—A day or two ago I observed some blossoms of a Damson-tree in my garden fallen on the ground, and as there had not been sufficient wind to knock them off, I was induced to examine them, and found that in every case the calyx had been bitten into by some insect, which had doubtless weakened the stalk, and caused the flower to fall on the least wind. I send you this at once, in the hope that some of your correspondents, with more leisure at their disposal than I have at the present moment, may be induced before the blooms are past to examine into the history of the insect in question, of whose operations I have hitherto met with no notice.—*J. O. Westwood, Hammersmith.*

Potter's Liquid Guano.—I cannot speak of this in any adequate terms of praise. I tried its powers on Hyacinths, Narcissus, Crocuses, Snowdrops, &c., both in pots and in glasses, and I may with truth say that the effect was magical. Not only were my flowers the finest, the healthiest, and the most luxuriant that I ever beheld, but they preserved their beauty nearly double their usual time, and gave forth a fragrance of surpassing sweetness.—*William Kidd, Sander's Cottage, New Road, Hammersmith.*

Figs.—With regard to these, I beg to offer a few remarks on what I have observed and put successfully into practice. The year 1818 was remarkable for abundance of Figs, on account of its long duration of heat and drought. Happening to call during that year at the Duke of Richmond's Gardens, Goodwood, near Chichester, in August, I was much pleased, and at that time quite astonished, to see a row of very large standard Fig-trees loaded with the greatest abundance of fruit, both ripe and unripe, in the highest possible perfection. The soil there is shallow, on a bed of chalk. I likewise observed during the same year abundance of Figs in many of the cottagers' gardens in Sussex, produced on standards that were growing in the same kind of shallow soil, and where the bottom was nothing but chalk. Figs appeared to be no luxury in that quarter. In Kent I have observed good Figs and very fruitful trees on a similar bottom. At the late Lord Audley's Gardens, Belvedere, Erith, I have observed the most abundant crops of fruit, raised for several years in succession in the highest state of perfection, where the soil is shallow and dry, and where the subsoil is nothing but a rock or bed of pebbly gravel, called there pea-gravel; after a heavy rain, scarcely a particle of earth was there to be seen on the surface. I have long observed that shallow dry soils are the best for producing good crops of Figs, and where the trees have been planted without much care, and allowed to grow without much pruning or nailing, which does not at all suit the Fig. Such places as stable-yards, farm buildings, in any dry corner, amongst stones, chalk, brick-bats, or lime-rubbish, where they are well trodden or paved about the trees, are the places to see fine crops of good Figs. Trees in such situations have a number of joints in the length of one inch of young wood. Over-luxuriant trees never bear abundant crops. The wood of a Fig-tree that is long-jointed, pithy, and soft, does not produce Figs in perfection. The growth of the Fig requires to be checked, if fruit is wanted. In preparing for growing Figs, instead of trenching the ground, I should recommend merely forming a flooring under them with concrete, brick-bats, stones, chalk, gravel, lime-rubbish, or with whatever is most convenient to be had, if the bottom is not naturally chalky, rocky, or gravelly. Those that are troubled with over-luxuriant Fig-trees might practise the following method, which I have myself done with good success:—Cut a trench, 3 or 4 ft. wide, in front of the trees (if against the wall, or all round them, if they are standards), below all roots, which should be cut clean off as the trench is dug, then fill up with any of the above materials that can be easily procured, pouring a quantity of grout amongst it as the filling up proceeds, or the roots will soon get through it; otherwise, build a wall, as recommended by Mr. Errington. Figs require to be planted high, and the depth of soil about them should not be more than one foot. If the season is very dry when they are ripening their fruit, the trees will be much benefited by giving them a good soaking of water, as that is the time when they will be benefited by water.—*Observer J—4.*

Slugs, &c.—To preserve your Annuals, Marigolds, &c., from slugs, and other vermin, scatter long shag tobacco (not pig-tail) round the stems. I have tried it with much success.—*A Sailor.*

Peaches of Leitmeritz.—I have received from a friend at Frankfort some Peach-stones, with the following memorandum:—"I inclose some stones of a curious fruit, cultivated in a part of Bohemia under the name of Peaches of Leitmeritz. To me they seem more like Apricots, with a little of the Plum in them, but less than the bloody Apricots of Naples,—a fruit I have never seen anywhere else. Something of the same sort is said by travellers to grow in Persia, but it is described as more completely a Plum, and to be very good, but it has a downy skin like all those I have mentioned. They would all, probably, preserve excellently." So far my correspondent. The stones appeared to me to resemble the Apricot more than a Peach or Plum. I rather think they had been kept too dry before they came to me (in number, 5 or 6). I planted them immediately in a pot, and placed them in a Peach-house. One of the number only vegetated; it has the decided leaf and character of an Apricot, and is growing well. Do you know anything of this Bohemian fruit?—*W.* [We are entirely unacquainted with it.]

The Season.—The weather the last ten days has been everything we could wish—dry, and growing, and not too hot. The Apricot, Peach, and other wall trees, with the Standard Pears, Cherries, and Apricots, are setting fruit beautifully. In fact, we have always fine weather in England nine months out of the twelve, whenever the column of air over our heads exceeds 30 inches. The power of the atmosphere to dispose of the daily-raised surface water from land, sea, and vegetation, is then so enormously increased, that, whether the dew-point at which the vapour begins to condense into clouds be at the height of 1500, 2000, or 3000 feet from the surface of the earth, the re-evaporation of these clouds by the power of the sun soon dissipates them again, and gives us the solar influence on the ground. Take the register of the weather from about 15th of April, to about the 15th of Oct., with the barometer fluctuating between 29.40, and 29.90; and again between 29.90 and 30.40 for periods of 10 or 12 days together, and the observation will prove my assertion that we have always fine weather with a high barometer, and warm temperature when the barometer is high. Ignorant persons who speak without observation, always cry out whenever the dust flies about in April and May, "Oh! if we could but have a little

warm rain now, we should do." My reply always is, "Your desired warm rain will soon end in cold rain, and cold weather."—*W., Worcester.*

Miscellaneous.—*Flora* states that a plant of Abutilon striatum has stood the winter in the Isle of Wight. It was planted against a hothouse-wall, and was only occasionally protected.——*A. C.* informs us that he has tried quick-lime and cheese for preventing Vines from bleeding, and says that "Drewen" is quite correct as regards its efficacy. He remarks, however, that our correspondent might have stated that it was the plan of the late Mr. Knight.——A correspondent remarks that wasps are very early this season. He states that he has already seen four; the first he observed was on the 15th of this month.

Foreign Correspondence.

Frankfort, March 10.—Some time since you had a question as to the possibility of naturalising Fire-flies in England. As far as climate is concerned, I think they might stand the climate of London, as well as that of Cassel, where I have seen them in the latter end of May. I suppose food is as great a controller of animal range as climate—and that one cannot provide. Slugs are scarcely known here—a great advantage in all gardening, and especially in the cultivation of early bulbs: perhaps the very pure sandy soil which covers almost every stratum in Germany, may be the cause. Our Flower Shows are preparing, and promise well this year. Rintz's Bellerophon is one of the finest azaleas I ever saw, and he has raised a hybrid Rhododendron campanulatum, which is very fine. The winter has been very severe, and snow very deep, until the other day, over all Germany, except this part.*

Societies.

ROYAL INSTITUTION.

April 19.—Mr. E. Solly delivered a very interesting Lecture on the Chemistry of Vegetation, and its application to Agriculture. He commenced by contrasting the study of organic with that of inorganic Chemistry; the uncertain and changeable nature of organic substances was compared with the more definite, fixed, and stable characters of inorganic compounds, and the difficulties attending the investigation of organic Chemistry were stated to depend chiefly on the great facility with which the various organic substances change, and are modified in properties and composition by comparatively slight causes. The composition of plants was next inquired into, and the manner in which, by very simple processes, they may be separated into what are called their proximate elements When a plant is macerated in water, so as to remove all the soft or soluble portions, lignin or woody fibre is left; the water in which it has been macerated, deposits, on being allowed to stand, a portion of starch; if after this the liquid is boiled, a scum separates or coagulates, consisting of albumen and gluten; whilst there remains in solution gum and sugar. He stated that, of these six substances the bulk of plants was composed; for though there existed hundreds of other vegetable substances differing in composition and properties, yet these constituted but a small part of the mass of plants, the great portion of them being composed of the six proximate elements just adverted to. When the process of analysis was carried still further, it was found that all these various substances were formed by the combination of three or four elements, united together in different proportions. The analysis of organic matter resembled that of inorganic compounds in the fact that each element was collected and estimated in a state of combination; thus, the quantity of water and carbonic acid gas given off during the combustion of any organic substance being known, it was easy to calculate the proportion of oxygen, hydrogen, and carbon which it contained. In this manner lignin, gum, sugar, starch, and many other vegetable products, on analysis were found to consist merely of oxygen, hydrogen, and carbon; whilst in the same way, gluten, albumen, and a number of other organic compounds, were found to contain, in addition to those three elements, nitrogen—the quantity of that substance present being estimated by the quantity of ammonia formed during combustion. Besides these organic matters, however, all plants were known to contain a small quantity of inorganic matter—substances which remained as ashes when the plants were burnt, and which on analysis were found to consist of various salts of the alkalies and earths, compounds containing phosphorus, sulphur, chlorine, &c. These being the elements of plants, the next questions were, whence and how plants obtained them? The composition of the air and soil was then described, and the probable sources of the food of plants pointed out. Mr. Solly observed, the growth of a plant could not be regarded as a mere chemical process; several powers were at work, which modified and controlled chemical affinity in a most remarkable manner. Foremost amongst these powers was the vital action; what this was we were quite ignorant, for we only knew it through the effects which it produced. The vitality of a plant or seed might lie dormant for years or centuries, and when all the other conditions requisite to vegetation were present, the plant would grow and feed itself; the conditions essential to vegetation, or the excitement of vital energy were heat, light, and perhaps also electricity. Plants could not grow, nor seeds germinate, at temperatures below the freezing point of water; a certain degree of warmth was essential; light also was necessary to the process of decomposition carried on in the organs of plants, whereby the elements of organic matter are assimilated; and lastly, though very little was as yet known on this part of the subject, it was hardly possible to doubt that electricity was actively concerned in these operations. Under the influence of these powers plants possessed the means of decomposing water, carbonic acid, ammonia, and nitric acid, recombining their elements in the various forms of organic matter; and it had been concluded from numerous experiments, that plants always absorbed or assimilated these substances in combination, and never in a free or uncombined state. Thus the nitrogen of the air, which constitutes about four-fifths of its bulk, does not appear to enter into the composition of plants, the nitrogen which they contain being probably wholly derived from the ammonia and nitric acid existing in the air and soil. The lecturer then drew attention to the relation which plants bear to animals, and the very important part which the former perform in the economy of the creation. The manner in which all animals, either directly or indirectly, derive their nourishment from plants was shown; and the perfect manner in which plants preserve the healthy and uniform composition of the atmosphere, by removing from it all the noxious gases generated by the respiration of animals, and the decomposition of organic substances was described. Mr. Solly next proceeded to consider the operations of the farm, and defined the object of the farmer to be the production of the greatest amount of food at the least possible cost. He contrasted the condition of natural pastures or forests, with cultivated lands; and described the effects produced by the constant removal of inorganic compounds from the soil, in the crops. If it was attempted to cultivate Wheat year after year on the same ground, it was found that the crops gradually deteriorated, and hence various manures, and systems of rotation or fallowing, had been adopted. By some it had been supposed that plants excreted poisonous matters from their roots, and that the presence of these excretions in the soil, rendered it unfit for the cultivation of the same kind of plant; but that this was not the case was shown by many facts, amongst others, by the circumstance that in some soils Wheat had been successfully cultivated for many years in succession; it was now known that the real obstacle to the constant cultivation of the same crop was, that the soil gradually became exhausted of certain inorganic substances essential to the growth of the plants, and hence it would appear that if the substances annually removed from the soil could be regularly restored to it, there is no chemical reason why a crop should not be grown for any number of years in succession on the same soil. The great question therefore was, How can we restore to the soil those substances on which its fertility depends, and which plants remove? Much, no doubt, might be done by mechanical agency; thorough draining and deep ploughing would greatly assist in keeping up the fertility of the soil; but at the same time a great deal also might be done by chemistry, and more especially in the preservation and application of manure. The loss of manure under the present system, was described as being enormous, and deserving the most serious and careful attention. The lecturer then enumerated some of the most important of the many substances employed as manure, dividing them into those which supplied the elements of organic matter, and those which supplied inorganic substances. In the former class the salts of ammonia were, of course, prominent, and the properties of that substance, and the mode of fixing it by acids, sulphate of iron, gypsum, &c. were considered. In the second class of manures, the value of those containing phosphoric acid, such as bones, was insisted on; and the value of phosphoric acid in a soluble state, as it exists in the excellent manure of Mr. Lawes, pointed out. The use of soluble silicates, and the manner in which silica is absorbed by plants, was experimentally illustrated, by precipitating silica from a solution of an alkaline silicate by a vegetable acid. The alkaline nitrates and common salt were next spoken of; and with regard to the latter, it was stated that though decidedly a good manure under many circumstances, it was highly improbable that it could act as a fixer of ammonia, because the results of its decomposition by carbonate of ammonia, viz. muriate of ammonia and carbonate of soda, are salts which, under ordinary circumstances, cannot exist together in solution; they decompose each other, common salt and carbonate of ammonia being formed. Amongst the substances which existed in many of the best manures was sulphur, an element which was present in most plants, and which was an essential constituent of those which formed the food of animals. Mr. Solly stated that plants in all probability absorbed a portion of the sulphur which they contain, from the atmosphere; his own experiments had convinced him, that so far from sulphuretted hydrogen being poisonous to plants, on the contrary in small quantity it was apparently beneficial, causing them to grow with increased vigour and luxuriance. This part of the subject derived additional interest from the probable influence which sulphuretted hydrogen has on the health of animals, and the connexion which exists between the presence of that gas in the air, and contagion, with various epidemic disorders. Mr. Solly then inquired into the possibility of plants deriving inorganic matter from the atmosphere; he described experiments made on various orchidaceous plants, which showed that they contained precisely the same amount of inorganic matter whether their roots grew in earth, or they were freely suspended in the air. It was unfortunately the case that no ordinary chemical tests would enable us to detect very minute quantities of solid matter in the atmosphere, but little doubt could exist that many solid substances were occasionally suspended in the air. In illustration of this subject some curious experiments were shown. On burning a small quantity of a mixture of nitrate of soda and charcoal, a cloud of vapour arose, which was made to traverse a long tin pipe, and the existence of soda in the air as it came out of the further end of the pipe shown by the effect which it produced on a small gas-light, the blue colour of which was immediately converted to a bright yellow. Mr. Solly stated that one grain of carbonate of soda thus distributed through a room containing 1000 cubic feet of air might be found for some hours after, diffused through every part of it, and hence he concluded that each cubic foot contained not more than the thousandth part of a grain of carbonate of soda; and as the test flame employed to indicate its presence did not occupy more than the thousandth part of a cubic foot, it might be fairly said to indicate the millionth part of a grain of carbonate of soda. By another experiment it was shown that the steam arising from a tolerably strong boiling solution of carbonate of soda contained a very notable quantity of that salt, its presence being proved by the effect it produced on the colour of flame. The manner in which volatile substances confer volatility on otherwise fixed substances, was illustrated by the evaporation of phosphoric acid in contact with muriate of ammonia, a small quantity of the acid rising in vapour, and condensing in large white flocks when heated with sal ammoniac, though when heated alone it was perfectly fixed.

Attention was next drawn to the enormous extent to which artificial manures are frequently adulterated, and the frauds which are too often practised by dealers on unsuspecting farmers. As a strong example of this, Mr. Solly stated, that a short time since he had procured a quantity of a saline manure from a manufacturer, and suspecting from its appearance that it was impure, had been led to analyse it; *on examination, it was found to contain only three per cent. of the salt for which it was sold, the remaining 97 parts being other substances.* If such things were done, it was not to be wondered at that we frequently heard complaints from those who had employed artificial manures, and had found no benefit from the use of them. Amongst the many subjects of interest connected with the application of chemical manures, few have excited more attention than the steeping or manuring of seeds. A number of curious experiments on this subject were described by Lord Bacon two centuries ago. He showed that seeds steeped in certain solutions germinated more rapidly than those soaked in other solutions; and remarks, that it is a very curious subject, deserving of further investigation. At the present time, this effect is as little understood as it was in that of Lord Bacon, nothing more being known than the effects first described by him. Mr. Solly stated that a series of experiments in elucidation of this subject had recently been commenced at the gardens of the Horticultural Society; and that very remarkable differences were becoming apparent in the effects produced by the various solutions employed. He also described a curious series of experiments on the effect produced by muriate of lime, in increasing the retentive power of the soil for moisture, and suggested the possibility of these experiments leading to useful results in the cultivation of the Turnip crop, in which it is of the greatest importance that the first growth of the plant should be healthy and vigorous, so as to get quickly through that period in which it is most liable to the ravages of the fly. The last subject brought forward was one of considerable interest, and involving speculations of a very singular nature. Mr. Solly drew attention to the remarkable fact that the fossil bones of extinct animals contain a considerable quantity of Fluoride of calcium; thus the bones of the Colossochelys or great tortoise discovered in the Himalaya Mountains by Messrs. Falconer and Cautley, contain 11 per cent. of fluoride of calcium; whilst recent bones on the other hand are found to contain little or no fluoride of calcium. It is reasonable to suppose that the earthy matter constituting the bones of these extinct animals, was originally derived from plants, and hence the question became one of interest—Whence comes this fluoride? It might be supposed that the fluoride had passed into the substance of the bone by some subsequent process. It might be supposed that the plants on which the animals fed contained fluoride of calcium; or lastly, it might possibly be, that some nearer relation existed between phosphorus and fluorine than we were yet acquainted with; and it was not impossible that the one might be converted into the other: this was mentioned merely as a curious speculation—possible, though perhaps not probable. In the meantime it was interesting to observe the action of fluoride of calcium in growing plants; and accordingly experiments had been instituted, the result of which as far as they could be ascertained at this early period, seemed to favour the conclusion that the fluoride was absorbed, and therefore that it might possibly, to some extent, supply the place of phosphate of lime in plants. Mr. Solly concluded with some general remarks on the progress of Agricultural Chemistry, and the probable results of its future study, expressing a regret that many are so sanguine as to the immediate benefits to be derived from it, that they can hardly fail to be disappointed by the results.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.

April 23.—This, the first Show for the season, was held in the Horns Tavern, Kennington. Although not superior to the last spring meeting, the exhibition was distinguished by a large number of well grown specimens. Among the Miscellaneous Collections, by gentlemen's grs., that shown by Mr. Atlee contained some fine plants, among which was a very large specimen of Cytisus racemosus, covered with bloom, a Purple Rhododendron of great beauty, a well-grown plant of Boronia denticulata, and a fine showy specimen of Acacia armata. In the same collection were also Corræa speciosa, Polygala oppositifolia in good condition, Kennedya coccinea, Boronia pinnata and other plants, including a fine specimen of Erica Willmoreana; for these, a large Silver Medal was awarded. —Mr. Curtis, gr. to J. Allnutt, Esq., sent a beautiful col-

lection of well-grown plants; it was chiefly remarkable for the fine specimens of Heaths it contained, among which were E. Hartnelli in good condition, a large E. depressa, a small plant of the free-flowering E. coccinea minor, together with E. campanulata, a beautiful plant of the showy E. vestita coccinea, and a large specimen of E. translucens, which was completely covered down to the pot with delicate pink blossoms. In this collection were also Epacris grandiflora, the larger variety of E. pulchella, Kennedya coccinea, and several other plants. The Royal Adelaide Cup was awarded to Mr. Curtis for these.—From Mr. Bruce was a collection also containing some well-grown plants. Among them were Acacia diffusa, a pretty plant of Aphelexis humilis, Euphorbia splendens, Clivia nobilis, several varieties of Azalea, plants of Tropæolum tricolorum, and brachyceras, Leschenaultia formosa, covered with bloom; along with Chorozema Henchmannii, and several Heaths. A Gold Medal was awarded for these.—Mr. Plant, gr. to J. H. Schroder, Esq., exhibited Thunbergia aurantiaca, a large plant of Cytisus racemosus, two Gloxinias, Diosma capitata, Oxylobium retusum, and other plants.—A middle Silver Medal was awarded to Mr. Hamp, gr. to J. Thorn, Esq., for a collection containing, among others, Euphorbia splendens, Epacris grandiflora, a pretty plant of Erica hybrida, covered with long flesh-coloured blossoms, a purple Rhododendron, Boronia serrulata, Cytisus racemosus, and the handsome Erica vestita alba, together with Gloxinia rubra, Eutaxia myrtifolia, two Chorozemas, and a good plant of Aphelexis humilis.—From J. H. Schroder, Esq., was a collection of Orchidaceæ, containing among others the beautiful Cattleya intermedia, the fragrant Maxillaria aromatica; also Vanda cristata, which has the good property of keeping long in bloom; a Middle Silver Medal was awarded for them.—Mr. Kennington, gr. to J. Cox, Esq., was awarded a Large Silver Medal, for Peristeria Humboldti, Dendrobium nobile, in good condition, Oncidium altissimum, and O. microchilum. He also exhibited some other Orchidaceous plants, two Chorozemas, a Pimelea spectabilis, and other plants, among which was a specimen of Erica Hartnelli.—Mr. Wood sent a collection of named Alpines.—The Nurserymen's collections were from Mr. Fairbairn, of Clapham, and Mr. Hally, of Blackheath. That of the former contained among other plants Boronia serrulata, Aphelexis humilis, a double variety of Azalea indica rubra, Erica Hartnelli in good condition, and a pretty small plant of E. delecta; a Middle Silver Medal was awarded for them.—In Mr. Hally's collection, which gained the first prize, were Acacia armata, a showy Azalea Smithii coccinea, a well-grown plant of Aphelexis humilis, a Cineraria, named Piper's Princess Royal, and a small dwarf plant of Genista Rhodopnœa. — Mr. Townly, of Camberwell, exhibited among several others, good specimens of Æschynanthus parasiticus, Columnea Schiedeana, Hardenbergia monophylla, Franciscea Hopeana, and Euphorbia splendens. Among single specimens was a handsome Manettia bicolor, which gained the first prize, from Mr. Hamp; a beautiful Tropæolum tricolorum, to which the second prize was awarded, from Mr. Ivery of Peckham; and a Cattleya Skinneri from Mr. Kennington. On the same table were beautiful small plants of Erica aristata major from Mr. Dickson, of Acre-lane, Brixton. There was a good display of Cinerarias; the collection from Mr. Ivery contained many flowers of great novelty and beauty of colour. Red Rover and Washington, bright crimson; Fanny Elsler, a white with crimson tip, a most prolific bloomer; and Black Knight, a deep purple; with Captivation, having mazarine purple tips, upon a white ground; and Criterion, with mazarine blue terminations, appeared to be the most novel and attractive.—Mr. Paul, of Cheshunt, exhibited two seedlings, one a pure white with dark purple disk; the other, a bright rosy crimson having quilled petals with expanded tips, is very good of its kind; the flowers are large and formed with great regularity. The Auriculas, although not so good as they were last year, excited much interest.—For pairs among amateurs, Mr. Schroder of Brixton, obtained the first prize, with Oliver's Lovely Ann, and Page's Champion.—Mr. Lidgard was second, with Smith's Waterloo, and Conqueror of Europe.—Among nurserymen the first prize was won by Mr. Dickson, of Acre-lane, Brixton, with Hedge's Britannia, a very fine flower, and Page's Champion. The second prize was awarded to Mr. Gaines, of Battersea, for Smith's Britannia, and Grimes's Privateer.—Mr. Dickson gained the first prize for the best 12, with Dickson's Prince Albert, Oliver's Lovely Ann, Stretche's Emperor Alexander, Hudson's Apollo, Dickson's Duke of Wellington, Salter's Garland, Dickson's Earl Grey, Taylor's Glory, Dickson's Comet, Lee's Colonel Taylor, Page's Champion, and Dickson's Matilda.—The first prize for the best seedling Auricula was awarded to Mr. Dickson, for one named Brilliant, a gray-edged flower of good properties: it trusses well; the colour is a brilliant purple, and the rings are uniform in width. Mr. Dickson showed another seedling named Richard Headley, a gray-edged flower, young, and very promising. The other seedling was from Mr. Franklin, a flower altogether very brilliant in appearance: the pips remarkably flat, and a good trusser, but the colour breaking a little into the edge.—Mr. Lidgard got the prize for the best 6, with Oliver's Lovely Ann, Page's Duchess of Oldenburg, Hedge's Britannia, Grimes's Privateer, Page's Champion, and Dickson's Apollo.—The Silver Cup given by Mr. Dickson to Amateurs, was won by Mr. Lidgard, with Page's Champion, Taylor's Glory, Conqueror of Europe, and Nelson's Funeral Car.—Prizes for Polyanthuses were awarded to Mr. Smith and Mr. Bushell.—The prize for the best seedling was given to Mr. Henbrey. There was no competition. The three seedlings from Mr. Barnard arrived too late for the censors; they were very superior flowers, and were recommended for a prize.—Mr. Plant received a small Silver Medal for 12 Hyacinths in pots.—The collections of Heartsease were numerous and fine, and in strength of colour we never saw them superior; there were many seedlings from Messrs. Thompson, Brown, Buxton, King, &c. Three were noticed by the Judges, and recommended for prizes. One from Mr. Thompson, named Virgil, a large flower of great substance, having a yellow ground, fine eye, with dark-purple maroon upper petals, and a broad margin of the same colour round the lower petals. Brown's Arethusa, has a pure white ground, splendid eye, with rich purple top petals, and a deep margin of the same surrounding the lower; this flower resembles Miss Stainforth, but the purity of the ground colour is a decided improvement. The other seedling was from Mr. Buxton, named Ne plus Ultra; this flower, with a splendid eye, has a bright yellow ground, and the side petals meeting above the eye, the shield is rendered unbroken; the colour of the upper petals and a broad margin round the lower, is of the deepest and richest purple. There were many more deserving of prizes. Mr. Thompson's stand was composed entirely of seedlings, and in Mr. Brown's we observed several new flowers of great merit. We give the names of Mr. Brown's flowers, his being the only stand with the names attached, viz., Brown's Arethusa, Curion, Morpheus, Elect, Prospero, Prior and Cinderella; Thompson's Jehu, Rufus, Warrior, Captain Boldero, Regulator, Cyclops, Eclipse, and Coronation; Hooper's Duchess of Bedford; Silverlock's Prince Albert; Cook's Black Bess and Mulberry Superb; Carpenter's Princess Royal; Earl's William Tell; King's Exquisite, Queen of England, and Sulphurea elegans.—From Mr. Chapman was a dish of Strawberries; and Mr. Kennington sent a plant of Keen's Seedling Strawberry, bearing large, well-coloured fruit. A small Silver Medal was awarded to Mr. Martin, for four sorts of Vegetables.

COUNTRY SHOW.

Ealing Annual Cucumber Shou, April 11.—Open to all England. Four brace of *Cucumbers* were put up for competition; they were all remarkably fine specimens of good culture, particularly those sent by E. Leathes, Esq., which won the first prize; they were grown in Mills's improved pit. The 2d prize was awarded to Mr. Humber; the 3d to Mr. Brown, and the 4th to Mr. Devon; they were judged according to their value, viz.:—the brace that would have brought the most money, if it had been sold in Covent Garden Market, was entitled to the first prize. As usual, the affair ended with a good dinner, and the evening was spent most agreeably.

Miscellaneous.

Botanical News.—Ad. de Jussieu has finished his "Malpighiaceæ," and his little "Traité de Botanique," which is very highly spoken of. He is now at a "Flora of Chili," founded chiefly on Claude Gay's collection.—A. Richard has just read a long memoir on the Vegetation of Mexico, and on Galeotti's Orchidaceæ.—Mirbel is preparing some fine plates on the Anatomy of the Date-Palm.—The 5th volume of Delessert's "Icones selectæ," is being engraved, and the printing of the 9th vol. of De Candolle's "Prodromus," is going on steadily.—Mr. Gardiner, of Dundee, has published a useful list of British Mosses, on a single sheet.—M. Adolphe Brongniart has read to the Institute a paper on the Placentation of Plants, in which he sustains Lindley's opinion, that ovules have both a central and a marginal origin. He, however, appeared to suppose his own views new, which they are by no means.

Guano from the Island of Ichaboe.—The following is an analysis of a sample of guano from the Island of Ichaboe, received from Mr. James C. Kemp, of Liverpool, and which is superior to most samples from other parts of Africa, which we have analysed:—

Ammonia, partly in the state of carbonate	10.0
Bone phosphate of lime, including a portion of oxalate of lime	24.0
Uric or Lithic acid	4.0
Alkaline salts, consisting principally of chloride of sodium	8.5
Phosphoric acid	4.0
Moisture, including a small portion of organic matter, volatile at 212°. F	24.0
Traces of silica, iron, &c.	0.5
Other organic matter, &c.	30.0
	100.0

The chief portion of the ammonia is in combination with the phosphoric and uric acids, and the remainder with carbonic acid.—*Watt, in the Chemist.*

Syrian Fruits.—Our readers will learn with pleasure that John Barker, Esq., lately H.M.'s Consul at Aleppo, after a residence of more than 40 years in the East, has returned to this country with trees of many new and valuable fruits. Among them are several Peaches, Nectarines, and Apricots with sweet kernels. These, when grown in Syria side by side with the finest of the varieties known in Europe, are said to have proved as superior to the latter as they are to the worst sorts of which we have any knowledge. Mr. Barker also possesses a White Mulberry from Armenia, so sweet that its fruit is dried like raisins, and so juicy that when pressed it produces the syrup in which the delicious butter of Armenia is brought to Aleppo. We shall watch with great interest the period when these fruit-trees yield their first crop in this country.

The Toad.—That the food of the toad consists of insects as well as worms, is a fact with which every naturalist is familiar, though all are perhaps not aware of the extent to which in certain instances it preys upon the larger Coleoptera, chiefly of the Carabideous kind. I once found, during the summer, concealed beneath a very large stone, one of these reptiles, the stomach of which was filled with the detached heads, thoraces, abdominal segments, elytra, &c. of Steropus madidus, Omaseus metallarius, Calathus. These hard parts, more or less broken, and with the flesh dissolved out and digested, had undergone no further change, so that the species they belonged to could be perfectly well determined. I have since met with toads in chalky districts where these beetles abound, which were literally crammed with them, and among others have found in the egesta the remains of Carabus violaceus, and of some also of the large Curculionidæ, such as Otiorhynchus niger. I have myself forced an ordinary-sized toad to swallow alive successively two of the first-named insect, which it effected without much difficulty, and have known it in confinement to devour two C. moniles inclosed along with it. These observations tend to throw some light upon the explanation of toads being found in holes of rocks and hollows of trees, whither they had probably resorted in search of the abundant store of insect food which these situations afford, and where they might remain until the cavity became closed up. It would be curious to witness in what manner the toad manages to seize and secure such a powerful prey as the Carabus, as something more than the viscid and adhesive secretion of the tongue must be required for this purpose.—*Alfred Tulk, Annals of Natural History.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

House plants in general promise to make a healthy and early growth this season, owing to the summer-like weather we have been favoured with lately; stimulants may, therefore, be applied earlier than usual to such strong growing plants as are known to be benefited in that way. Stove plants, at this stage and under strong sun, can hardly be kept too hot in the day time, providing a slight shade is thrown over the glass, the atmosphere kept moist, and a free supply of air admitted; and under such treatment they can hardly be too cool at night.

Conservatory.—The flowers have faded so quickly of late that blinds have been reluctantly made use of at last, but they are drawn up early in the afternoon; the paths and other parts of the house freely sprinkled over, and the house cooled down as much as possible at night. If we had cold east winds and broken April weather, the treatment of the conservatory must have been very different from this. Camellias now making their growth, require large portions of water daily, if the pots are thoroughly drained. Orange-trees also require more water for the next month than at any other time. Watch carefully the progress of climbers; see that they are properly trained, they soon get out of order now.

Greenhouse.—I never recollect of such fine weather for greenhouse plants at this season; besides the moist heat for encouraging rapid growth, they may have as much air as at any other period. Let them be syringed every afternoon, and the house shut up at night, till the growth of the principal tribes is nearly finished, when they may be kept more cool and dry to ripen them off slowly.

Pits and Frames.—In the first week of April, I sowed a large collection of the more tender and scarce annuals, together with some perennials, which required some careful nursing at first. They were sown in light soil, in a frame without any bottom-heat; the lights were kept quite close till the seeds began to vegetate, then the lights were entirely taken off at night and put on again about 7 o'clock in the morning; no air was admitted all day. The sun heat rose the temperature inside some days to 130°, and early next morning they were in a temperature under 40°. I never saw more healthy seedlings.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

Some of the early-sown annuals will now require thinning out, in doing which remove all but five or six of the strongest plants, and these, if not very strong, may have the terminal leaf-bud removed to make them bushy. Stir the ground around the plants deeply with the hoe, and if the plants are weakly, apply a slight dressing of superphosphate of lime or Potter's guano, and then give a good soaking of water. I rather suspect the former manure possesses the property of giving colour to flowers, as some plants treated with it here are more brilliant than I have ever noticed them elsewhere. Many of the Herbaceous plants will now require a little training; and in regulating them, do not bundle them up like so many Pea-sticks, but tie the branches out separately, as you would a prize Pelargonium. Attend to young growths on climbers before they get crowded, and remove any strong branches which are not likely to produce flowers. The covering from half-hardy plants may now be removed entirely in the day-time, but it will be well for a fortnight longer to stretch a mat over the heads of the plants for fear of frost, which would play havoc after this sunny weather. We had six degrees of frost here on the morning of the 25th. Keep all newly-planted trees well watered; and recently laid turf should be watered, and afterwards covered with old tan to prevent its burning.

Rosery.—Examine the plants, to see that "the worm in the bud" is not at work, and dress them, if necessary, with Tobacco-water and soap-suds, to clear them of the Aphis or green-fly. Many of the strong-growing hybrid China and French varieties will be the better of having some of the strong growths thinned out;—indeed, no more branches should be left upon a Rose than can be properly exposed to the sun and air. Remove the strongest branches, which frequently run into water-shoots; the middle-sized ones generally produce the finest flowers.

Conservatory Walls.—Although these structures are becoming very fashionable in large gardens, they do not accord with my ideas of good taste, as the existence of the plants in the winter is a very precarious matter, and even if they do survive, except in the case of climbers, it is too frequently as miserable and distorted specimens. Fine Roses, Wistarias, and Bignonias, are the plants to cover a wall with, and not miserable greenhouse plants. However, where they have been protected, the covering may be removed in the day time, but replaced at night; and plants for filling up blanks, of which there are generally plenty every spring, may now be planted out.

Pits and Frames.—The plants are of course being removed from these structures to temporary protection as fast as possible. If they are not quite clean give them a good fumigating before they are taken out. Pot off all recently propagated plants, and see that you have a sufficient stock of everything to plant your beds properly; if not, get in some more cuttings without delay, which will do admirably to fill up gaps in the summer.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas are in most situations fully expanded, with the exception of the Northern Counties, where they are somewhat later. In order to preserve the bloom, the pots must be removed to a cool place having a north aspect, and should be placed on a neat stage, "tier above tier." Covered with an awning of calico, and regularly watered, they will retain their beauty for at least a fortnight or three weeks. The direct rays of the sun have a prejudicial effect on the colours, causing the dark or body colour to start or diffuse itself over the margin. Few spring-flowers are so beautiful, or more worthy of the trouble requisite to ensure their perfection. *Polyanthuses.*—This dry weather is favourable to the attacks of red spider. These pests dislike moisture. Should

a plant unfortunately get affected (which is soon ascertained by the margin of the leaves turning inward, and assuming a yellow hue) I have found that by watering it well, and placing a common garden-pot over it, occasionally discharging some Scotch snuff on the under-side of the leaves by means of a small "puff," made with an Indian-rubber bottle, having a small pipe inserted in the neck, they may be destroyed. When in full possession of the plant they are difficult to dislodge, but by perseverance this plan will succeed.—*Tulips* are rapidly throwing up their blooms. In all probability we shall have some sharp frosts; a few years ago, on the 7th of May, the buds of my Tulips, which happened to be uncovered, touched the ground, and I thought the bloom ruined; I covered them from the sun, and they flowered well. *Carnations and Pinks.*—The sticks had better be inserted in the blooming-pots now, not only to support some varieties that have a tendency to spindle early, but, if delayed longer, pushing them down is apt to injure the roots. Keep the pots free from weeds.—*Dahlias* are in many places already planted out; protect with pots at night. Snails will sometimes eat through the stems; a little chaff or soot spread on the surface of the soil will obstruct them in their ravages. It is the safest plan to plant the first week in May.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pinery.—Should the bottom-heat in the fruiting-pit fall below 80°, some fresh, moist tan should be put round the pots to the depth of two or three inches. This will soon revive the heat, which will probably not require renewing again for some time, as the natural heat of the season will keep it up. The bottom-heat of any of the pits may be renewed in this way, where the pots stand so far apart as to allow of the tan being put in, levelled, and patted close down, by means of a light, narrow spade, with a short handle. Give a small portion of air in the morning, as soon as the temperature of the pits is affected by the sun; letting the heat rise to 85° or 90°, with air. Shut up early, sprinkling at the same time. Watering, whenever necessary, must be regularly attended to. Shade any sickly plants during sunshine, and if they are in a place by themselves keep them close and moist till they recover.

Vinery.—When the fruit is fully ripe, let the temperature fall to 55° by night, and give plenty of air by day. Endeavour to keep the foliage fresh and green as long as possible. Vigorous Vines will continue to produce laterals after the fruit is ripe. It seems most in accordance with Nature to allow these to grow as much as they will. By so doing the roots are encouraged to extend, and every part of the plant is strengthened. In succession Vineries little fire will be required in fine weather before eight or nine at night, if they are shut up early; and if the houses are at 60° in the morning, and the day likely to be fine, none need be lighted. Continue to stop the laterals till the fruit is fully swelled, and thin the bunches as soon as the berries are fairly set. Where the Black Damascus and the Cannon Hall Muscat Vines are in bloom, keep a moderately dry atmosphere till the fruit is set; and as they are rather shy setters, it is well to impregnate the blossoms with the pollen of some other sort, in which it is more plentiful. The best method of performing this operation is to shake the pollen upon a piece of fine paper, and then holding it under the bunch to be impregnated, to blow a little on it with the mouth. Repeat this twice a day till all the fruit is set.

Peach-house.—The Peaches started early in November will now be about changing to ripeness, and will require more air and less moisture; but in all cases avoid sudden changes. Let the fruit be fully exposed to the sun. Continue to encourage the swelling of the fruit in the second house, by keeping a regular night temperature of from 60° to 65°. Give air early in fine weather, and water freely. Keep the latest house at 55° by night, and from 65° to 70° by day, treating the trees in all other respects as recommended at different times for the earlier houses.

Fig-house.—Where Figs are grown in a house by themselves a temperature of from 55° to 60° by night is sufficient. If the first crop is gathered have recourse again to syringing, and water freely at the roots.

Cherry-house.—After the fruit is gathered, wash the trees repeatedly with clean soft water, to clear them of insects. Give plenty of air, and keep little or no fire. Give water as required to enable them to complete their growth. Thin the bloom on trees intended for a later crop; give them plenty of air, and shade from hot sunshine.

Melons.—Let the plants be looked carefully over every day, to ascertain if the thrip has begun its ravages. If it is perceived, let every leaf that is infested be washed with a solution of half an ounce of soft soap in a quart of water, to which half-a-pint of Tobacco water may be added. It should be applied with a sponge, or a fine-rosed syringe, to the under-surface of the leaves. If a syringe is used one person must hold the leaf while a second sprinkles it. Give air in the morning, as soon as the sun begins to act on the temperature of the pits, or the vapour which will arise will condense on the glass, and dropping on the leaves will cause them to burn and become spotted.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

The remarks made last week with respect to fruit-trees are still applicable. *Strawberries* are now showing their flowering-trusses, and if rain does not fall soon many of the blossoms will run blind, unless water is poured along the rows from the spout of the water-pot, after the ground has been mulched with straw or short grass. *Currants* and *Gooseberries* promise an abundant crop, except where the latter were deprived of their buds by birds, which they have been to a great extent this season, though untouched here previously for years.

Sow *Turnips*, *Radishes*, *small salading*, *Lettuces*, *pot-herbs*, and *German Greens* or *Borecole*, and *Brussels Sprouts*, for an early supply. Of these two last truly useful vegetables it may well be said, "Gather and have, cut and come again." *Onions*, *Parsnips*, *Carrots.*—The first sowing will require to be slightly Dutch-hoed between the rows, to kill germinating weeds, and prevent the cracking and drying up of the ground. Onions have become a rather uncertain crop in many parts of the country lately. Part of the crop failed here for two seasons: the plant swelled, became spongy at the bottom, and then died off, though no worm or grub was visible. On both occasions the part that failed had succeeded a heavy crop of Cabbages: practice would therefore say, Do not sow Onions in such circumstances;—though nothing succeeds better than Cabbages after Onions. Slightly rolling the ground after the seed is up is a good preventive against this unnatural swelling at the root. *Asparagus.*—There is much variety of opinion respecting the gathering of this vegetable, most gardeners cutting all at first indiscriminately, though theory would seem to say, Leave at least the weaker shoots untouched. *Routine.*—Attend to frames, cold pits, &c. Thin Turnips and Radishes. Prick out Cauliflowers and more Celery for succession: choosing for the latter an open situation, as it is better to shade now than be obliged to shade after the plants are turned into their ridges or beds; which must either be done, or the plants will suffer in consequence, if they are transplanted from the north side of a hedge or wall.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—In early warm situations it is probable that the bark of Oaks will now, or very soon, separate freely from the wood. When it does so, the operation of felling, peeling, and drying the bark, should be forwarded.

Coppice.—The clearing away the produce, and any useless stuff, is, in most cases, probably completed by this time; if not, it ought to be done as soon as possible, by way of preparation for felling and peeling Oak-poles, where they are to be cut this season. It is now the best time to cut down Birch, where a vigorous after-growth from the stools is required, and it prevents injurious bleeding.

Young Plantations.—In this department most of the operations so often mentioned are, it may be presumed, completed by this time, or progressing quickly. Where Larches are thinned out for the bark, that work should be forwarded when the sap flows freely. As soon as they are in bloom, where the best Larch timber is desired, it would be advisable to mark with a dot, or with a strip of paint, all those with white-blossomed cones, that they may be taken down at future thinnings, as the red-blossomed trees produce the best timber.

Hedgerows.—All newly-planted trees should be frequently examined, to see if they are in a proper state, as to being secure from the effects of boisterous winds, drought, and cattle.

Nursery Work.—At this dry season constant attention should be paid to newly-sown seeds, before and after the plants are up. They should be carefully watered, shaded, sheltered, and protected from mice, birds, slugs, &c. Recently-transplanted seedling and other young plants, should also be attended to by hoeing and destroying all weeds from among them.—*W. B.*

State of the Weather near London for the week ending April 25, 1844, as observed at the Horticultural Garden, Chiswick.

Sat. 4	65.3	42.9	54.1	7	0.70	3	3	3	—	5	2	2	—

The highest temperature during the above period occurred on the 28th, 1840 —therm. 77°; and the lowest on the 27th, 1836—therm. 27°.

Notices to Correspondents.

ALNUS.—*H.*—There is no such plant as Alnus glutinosa oblonga foliis ellipticis; nor is such a name to be found in the printed List of the Derby Arboretum. But there is Alnus oblonga, *var.* elliptica, which, no doubt, is the plant you mean, and which is the same as Alnus pumila of Messrs. Loddiges' Catalogue.¶

APPLE.—*Mealy.*—Ashmead's Kernel or Dr. Ashmead's Kernel is a Gloucestershire Apple, raised by Dr. Ashmead, and we are not aware that it is known by any other name. In appearance it resembles the Old Nonpareil, but is not equal to it in quality. It is, however, esteemed a good dessert Apple, from November till May.‖

BARK —*M. B.*—There is no mode of restoring the bark to old Oaks and White Thorns, except encouraging their growth and plastering the wounds with clay and cowdung; but it is a tedious operation. A mixture of cloacine and soot painted on young trees will, without injuring them, prevent their being barked by hares or rabbits.

BEES.—*X.* says that while Bees are described by one person as very fond of the Polyanthus, in the directions for managing florists' flowers we are told they never alight or work on them; and he asks, which is correct? His own experience says the latter.

BOOKS.—*J. T.*—Bevan on the Honey-bee.

BROCCOLI.—*P. Q.*—Your Broccoli is a fine large white variety; and if it comes in, as you state, about the middle of April, it may be found useful; but there are many like it now in Covent Garden Market.‡——*P. M.*—Knight's Protecting is a good hardy Broccoli; or Chapple's Early Cream will possibly suit you.‡

CAMELLIAS.—*A Subscriber.*—The soil best adapted for these is a mixture of peat and loam in nearly equal proportions. When the loam is light and sandy, a less quantity of peat is necessary. The whole should be well mixed together. In potting, the rough turfy parts of the soil should be kept next the bottom of the pot, in order to secure a good drainage, which is very essential to the growth of the plants. The proper season for repotting those that require shifting is when they have made their young wood, and when the blossom-buds for next year can be detected at the ends of the shoots. Camellias are very fond of liquid guano.‡

CEDARS OF LEBANON.—*W. C*—In replying to a lady, we supposed the question to relate to cutting off large limbs. If it is only the small shoots that are to be pruned, why then you cannot take a better season than when the plant has just begun to harden its new growth; for such wounds will not bleed, and will the sooner heal. Large wounds can never be made with safety, but are least dangerous when the sap is at rest.

CINERARIA.—*W. J—n.*—The Royal Blue is a good variety.*

FERNS.—*M. A.*—We would willingly recommend some one to supply you with Ferns for a Ward's case, if it were not a fixed rule with us not to name one nurseryman in preference to another. All nurserymen can procure them, if they choose, although they may not have them. There is nothing to say about the soil they require, for if they have but light and moisture they will all do well in peat. We see no use in the paper you propose; as to their size, the seller can always state that.

FUCHSIAS.—*X.*—It will no doubt depend on their parentage whether the new hybrids will bear the winter in the open ground, as decussata, gracilis, and many of the other sorts do. We apprehend that all those bred from fulgens, cordifolia, and corymbiflora, will be more or less tender.

HEATING.—We must refer *A. B.* and several others to observations in a leading article of to-day.

HYACINTHS.—*Senex.*—Hyacinths can be only retarded in their growth by shade and a low temperature. We presume that under ordinary circumstances they would be best kept back by being planted under a north wall. Cannot you find out what your neighbours do? Certainly plant in November. Superphosphate of lime is formed by mixing sulphuric acid with bone-ashes or bones ground to a fine powder.

INSECTS.—*Mr. Bransby.*—You are, I have no doubt, correct, in assigning the mischief done to the bark of your Roses, &c. to the attacks of the Beetles you transmitted. They are named Otiorhynchus tenebricosus, whose history, &c. was given in the 2d vol. of the *Chronicle*, p. 316, where the best modes of destroying were stated. *R.*——*E. M.*'s Caterpillars were hatched from the ring of eggs formed round the Apple-twig; they will change to a moth called Clisiocampa neustria, which was figured and described in last year's *Chronicle*, p. 244. *R.*

MANURES.—*Guichenet* may apply guano twice or three times while the plants are growing.‡——*Tom.*—Disinfecting signifies depriving of smell. As a manure your filthy horsepond is not the worse for its offensiveness; you may probably sweeten it by throwing into it charcoal dust, which, when scraped out again, will be a very valuable material. Its smell may also be removed by bleaching powder, but that will perhaps be too expensive.——*A Subscriber.*—As a general rule, it is found that 4 cwt. of Potter's guano is an ample supply for an acre of ground. Sow it on the ground broadcast, and then turn it in. We have, at present, no experience with Humphreys's Farmers' Compound. Put these manures on now that plants are making their growth. You have not a day to lose.——*Northumbria.*—All manure is useful. We have no knowledge of the effect of Rabbits'-dung in particular.‡

MELONS.—*P. P.*—Thanks; we are only waiting for the wood-engraver.

NAMES OF FRUITS.—*Rambler.*—The Apple you sent from a tree about a century old, appears to be a Reinette Grise.‖

NAMES OF PLANTS.—*A. C.*—Xanthorrhiza apiifolia. Ornithogalum nutans.——*J. N.*—Catesbæa spinosa.——*H. H.*—To all appearance, Prunus domestica.——*D. V.*—Ruscus racemosus.——*Geo. Plumbly.*—Pinus insignis, true.¶

PLANTS.—*A Lady.*—By means of your forcing-pit you may keep up a succession of bloom in a small greenhouse during winter. The following plants are suitable for the purpose:—Camellias, the different varieties of Azalea, Persian Lilacs, Chrysanthemums, Kalmias, China, Bourbon, and Moss Roses, Lily of the Valley, and of course the various bulbs that are used for forcing, such as Hyacinths, Tulips, Guernsey Lilies, Roman Narcissus, &c. Several Heaths also flower in winter, as E. gracilis, tenella, hyemalis, assurgens, and some others:——*A Novice.*—You may plant in your pond Nymphæa alba and lutea, Villarsia nymphæoides, Nuphar minima, Hottonia palustris, and Caltha palustris for rock-plants. See p. 152, 1844.‡

POLYANTHUS.—*W. J—n.*—Dark ground. Pearson's Alexander, and Lord Nelson, crimson do.; Buck's George IV., and Hollit's Chester Favourite.*

POTATOES.—*A Subscriber.*—If at any horticultural Show Potatoes which gained a prize for being grown in the open ground were grown on a bed of manure, boarded at the sides, and covered over at night with hurdles and matting, or at the edge of a hotbed, that circumstance ought to have been mentioned by the exhibitor, in fairness to others who did not employ such means to bring them forward.

RABBITS.—*L. S.*—Rabbits are not *Game* within the Game Act, and the occupier of land, or any person, by his direction, may destroy them without a certificate. For this purpose he may use poison; but in doing so, he must take care not to infringe the section of the Game Act referred to by "A Sportsman."—*W.*

THORNFIELD PINES.—*J. M'G.*—Have patience. We are inquiring, and the result will be made known. We never make statements for or against a thing without being sure of our facts.

TUBEROSES.—*D. C. M.*—The treatment you have given these is perfectly correct; but they require to be started first in a gentle bottom-heat.‡

VERBENAS.—*W. J—n.*—Procure the following varieties:—*White*—Youell's Princess Royal, and Ivery's Queen. *Orange*—Croft's Formosa elegans and Kyle's Speciosa. *Purple*—Hendersonii and Ivery's Purpurea perfecta. *Scarlet*—Melindris Major, and Girling's Boule de Feu. *Lilac*—(the nearest approach to blue); Lilacina, and Miller's Blue Queen. *Pink*—Catleugh's Ne plus ultra, and Burleyana. *Flesh*—Julia Grisi and Goliath.*

VINES.—*Guichenet.*—The present year's shoots of these may be inarched as soon as they will bear a slight ligature. A little tallow may be spread over the tying to exclude the air.‡——*Northumbria.*—You must not cut back your Vines now when they are considerably advanced in growth; you should encourage them to make as good wood as possible early in the season, that it may be well ripened by autumn. The shoots should be kept thin and regular, so as to expose as many of the leaves to the action of light as possible. When the weather has become warm, let plenty of air be admitted; it should be given early in the morning, and the house may be shut up pretty warm in the afternoon. In the winter pruning, the shoots should be cut well in, and if the spurs are too thick they should be thinned out. By this treatment, under favourable circumstances, you may expect a good crop next year.‡

MISCELLANEOUS.—*A. B.*—In exhibiting Calceolarias at the Shows round London it is not allowed to put more than one plant in a pot. In watering Heaths soft water must be used; they may be occasionally watered with it overhead after a warm, sunny day. It washes the dust off them and refreshes them.‡——*T. Farleigh* should remit his subscription to the newsman who supplies him with the Paper.——*Mealy.*—You will find a selection of good sorts, affording a succession, at p. 152, 1844.‡——*A Subscriber.*—It is possible that some of your old Cape seeds may still grow; but only Nos. 1, 5, 13, 14, 15, 22, 23, are worth raising. We exclude the Proteas because you will hardly flower them; they are, however, all handsome. To give these seeds a chance you should sow them in *dry* soil, in a damp hotbed, with a bottom-heat of 80°, and trust entirely to the moisture of the atmosphere there till they begin to germinate. They may then have a *very little warm* water, until they have acquired green leaves. After that they will want no further special care.——*J. S.*—We really cannot do the duty of a shipping agent. We know nothing of passage-money, and such things. We advise no man to go to the United States who can at all get on here; and as for Texas, why it is insanity to think of such a country in its present state.——*J. R.*—The Cuckoo was heard near London last Tuesday, April 23. We have not yet heard the Nightingale.——*Ignoramus.*—It is impossible that we can answer your question in ignorance of all the circumstances. The plants probably die off from being too thick, or too damp; but we cannot say this with certainty.‡——*Tyro.*—See p. 247 in last week's Paper.‡——*Northumbria.*—Bokhara Clover-seed may be obtained from any respectable Nurseryman.‡

SEEDLING FLORISTS' FLOWERS.

AZALEAS.—*T. C. B.*—There is nothing in your Azaleas to distinguish them from other varieties.*

CINERARIAS.—*A Constant Reader.*—Your seedlings are too small, and like sorts already out; for instance, your best seedling, No. 1, is like one in cultivation called Goodeii, but inferior to that variety in size and substance.*——*J. C.*—Your seedling is very attractive; the crimson centre, with mazarine purple termination to the petals, is of the richest colours; the petals are rather narrow, but the flower is a good size, and most brilliant and beautiful in colour.*——*Anon.*—No. 8 is your best seedling, but one similar to it named Fanny Elsler, has been sent out by Mr. Ivery. Your flowers, generally, are inferior to those commonly grown; they have narrow petals, wanting substance, and are generally too small.*

PANSIES.—*W. T. H.*—Your seedling wants substance; it is also deficient in form, the upper petals being too large. To insure their arrival in a fit state to form a just opinion of their qualities, Pansies should be packed in damp Moss.*——*A. B.*—Your seedling Pansies will not rank as show-flowers; their form generally is not good, the top petals being too large and the ground colour uneven; the best is one without a number, a young bloom with a narrow edging of purple round the lip; a flower of good substance, which promises well *—— *Z. Z. Z.*—Your *Dark Defiance* is a large flower of good form, but rather deficient in substance.*

POLYANTHUSES.—*T. C. B.*—Your flowers not being well packed, some of them had escaped from their fastenings, so that it was impossible to tell to which numbers they were attached; they would have travelled much better packed in a little wet Moss. There is one property essential to a fine Polyanthus, which is, that the eye and lacing be of a uniform yellow. In this quality all your seedlings are deficient; in some of the flowers the lacing is good, and the ground-colour fine, but they are all deficient in the quality pointed out. The largest flower is the best.*

RHODODENDRON.—*G. B. S.*—Your Seedling makes a handsome and showy variety for the garden. The heads of flowers are large, compact, rich in colour, and the foliage is very handsome; the flowers individually appear to be a little cramped in opening, their surface not being sufficiently smooth; but this defect may arise from the bloom having been cut *

JOHN RIVERS, Sawbridgeworth, Herts, begs to inform Agriculturists in general that the MANGOLD WURZEL and SWEDISH TURNIP enumerated beneath are new and of his own growth, and can be recommended with confidence. The Russian Swede, with yellow skin and yellow flesh, was imported by him in 1835, it has been since carefully selected, and is recommended for productiveness and superior hardiness, and for its not being so liable to mildew as the Liverpool and other dark-coloured varieties.

Long yellow Mangold Wurzel, growing much out of the ground, fangless, with fine top . . . . 1s. per lb.
White-fleshed, purple-skinned Globe, for thin soils, 1s. per lb.
Long Purple, superior stock . . . . . 9d. per lb.
Russian Yellow Swedish Turnip . . . . . 2s. per lb.

Carriage paid to London.

Lawn Grasses, mixed with dwarf Clovers, warranted to insure a fine sward (weight 20lbs. per bushel), price 14s. per bushel; Pasture Grasses mixed for any description of soil, varying in price from 8s. to 12s. per bushel; three bushels per acre recommended upon a clean tillage, to be sown at Midsummer, with a portion of Lucerne, Perennial Clover, and Sainfoin, upon soils that are not too retentive of moisture.

If a description of the soil intended to be laid down is given, J. R. trusts, by attentive observation of the various Pasture-Grasses, both separately and in pasture, upon various soils, to give satisfaction to those favouring him with their commands.

TO PARENTS AND GUARDIANS.

THOS. DIXON, LAND SURVEYOR, AGRICULTURAL ARCHITECT, &c., Darlington, has at present a vacancy for a well-educated Youth as an Articled Clerk or Apprentice.—For particulars apply as above.—Darlington, 24th April, 1844.

The Agricultural Gazette.

SATURDAY, APRIL 27, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

May 7	Framlingham.

AT page 79 of Mr. Layton Cooke's excellent work on the value of land, in the course of remarks upon VALUATIONS ON ENTRY, the following passage occurs:—"In some of the southern counties of England the aggregate value of tenants' rights . . . is frequently of serious amount. These valuations recur at every change of occupancy; the amount is payable by incoming tenants, who, notwithstanding they are reimbursed on quitting, are, during their respective terms, deprived of the use of no inconsiderable portion of the money that should be expended in the cultivation of the land. The valuations alluded to include charges for fallows, half-fallows, dressings, half-dressings, leys, fodder, manure," &c. The author then proceeds to say, that if land were better cultivated where this custom prevails than elsewhere, there would be a reason for preserving it; but he states that the contrary is the case, and that thus the many existing reasons which render it the landowner's interest to buy up these tenants' rights, or otherwise terminate them, are doubly strong.

Believing Mr. Cooke to hold an erroneous opinion upon this important subject, and finding that he rests his case upon its connection with that other important subject—on which we have a useful article from a known correspondent in another column—the capital required by the farmer, we intend to make a few remarks upon it.

Clauses of entry in leases of arable land may be regarded in a national point of view, or they may be considered as affecting the interests of the landlord, or those of his tenant; in every point of view, we think that payment to the outgoing tenant of the full value of all his property in the farm he is leaving may be shown to be true economy. The fact that some districts where this practice prevails are badly cultivated, by no means proves the practice to be bad policy. Security for the tenant is only one of at least three things on which good Agriculture depends. These three things are—1st. The possession of sufficient capital; 2d. Enterprise and intelligence sufficient for its profitable investment in cultivation; and, 3d. Security for it from the party in whose land it is thus invested. This last may be perfect, but if not accompanied by the other two, as it probably is not to a sufficient extent in the districts to which Mr. Cooke refers, then its influence is necessarily but small. We say "probably," partly from a personal knowledge of some of those districts, and partly because we can point to other districts which are well cultivated where these entry-clauses are common in leases, and where perfect security for the tenant, insured by them to the very end of his tenancy, is accompanied in greater degree by the other circumstances upon which, as we have said, good farming depends. Security to the tenant for the capital which is invested in another's land is only one of the three things which, when they meet on a farm, necessarily cause its good cultivation, but it is at least as important as either of the others: for if it be absent, the greater the intelligence of the tenant, though he possess capital in abundance, the more clearly will he see it to be his interest to be cautious and parsimonious in its outlay. This security is sometimes insured to a tenant, though necessarily imperfectly, for it can then only last a lifetime, by the known character of his landlord; hence, we sometimes find districts well cultivated where leases are unknown; but where it exists at all, it is more generally insured to him by a conditional grant of the lands he occupies for a certain number of years. Upon the nature of this lease, and especially upon its clauses of entry, depends the degree and the duration of the protection which it affords; and while the fact of its being a private business transaction between two parties—a landlord and a tenant—might in some minds forbid our meddling at all in the matter, nevertheless, its important national bearings, independently of the desire any competent person may feel to be of use to the agricultural part of the community, are such, we think, as justify us in stating and pressing our opinion on the subject.

In leases which require the tenant to leave upon the farm, unpaid for, the manure, the straw, and the cultivation of the last year of his tenancy, for the benefit of his successor, it is certainly the interest of the farmer, and, as he entered upon the farm under similar circumstances, it is his duty also to himself and to those dependent upon him, so long as he can do it without breaking any of the conditions by which he is bound, to take everything out of the land which he has spent upon it. Under these circumstances, of a 14-years' lease, the first four may be considered years of outlay, during which the farmer is engaged in remedying the faults of his predecessor, and in bringing the land into good cultivation, thus investing capital which is to lie dormant during his tenancy; during the next six the land ought to be yielding well, and repaying this outlay, the tenant being then at the comparatively small annual expense of farming land in good cultivation; during the last four the land should still be profitable to the tenant, not because of his continued exertions to maintain its fertility, but because he is now, in justice to himself, busily using all the powers which the conditions of his lease leave to him, in making as much money out of the land as he can before he leaves it. He is, in fact, now engaged in recovering all that capital which he had invested during the earlier part of his tenancy, and which had remained dormant during its continuance; he is doing his best to leave the land in the same state in which he found it. He has no such great interest in growing luxuriant crops either of grain or roots during the last year of his lease, for he is paid for neither the straw of the one, nor the manure made from the other, having already bound himself to leave both upon his land without remuneration.

If, to adopt another system, he were paid the full value of all the produce of the farm,—if he then expected to make as much of all the produce of his capital during the last year as during the others,—he would have no interest in taking it all out of the land before leaving it. If he were paid a full value for the manure and the straw left on the farm, and for the labour spent in its cultivation for the next crop, all which, besides the marketable commodities of grain, beef, mutton, &c. are the produce of his capital, he would have as great an interest during the latter as he had during the former years of his tenancy, in preserving the fertility of the land; and he would leave it for his successor to enter upon, in a condition to which, under the other system, it would hardly have been brought after four years of unprofitable outlay. The incoming tenant under this system makes all the payments—hands over the amount of his dormant capital—in one sum to his predecessor, while, under the other system, it would have required a period of four years at least for its profitable expenditure; and he has this great advantage, that with a 14 years' lease he has 14 years during which he reaps the full benefit of his outlay, while under the other, with a lease of the same duration, he would have reaped the full benefit of his outlay during only six of those years, and but a partial benefit during the last four. And how much better than the other is this system to look at it in a national point of view! The difference between the two in result, is just the difference between two districts, the fertility of the one being maintained and gradually increasing, while that of the other suffers periodical diminutions. Under an arrangement requiring the tenant to leave a large part of the produce of the farm unpaid for to his successor, of every 14 years, supposing that to be the duration of the lease, the central six are highly productive because the land is then in best cultivation, but during the remaining eight its average produce is much diminished, because during one half of them, it is rising from, and during the others, it is falling to the bad state of cultivation in which it is periodically left. If, as it cannot be questioned, the prosperity of a nation depends much upon the amount of its free * agricultural produce, then a state of things such as this must be nationally injurious—the periodically imperfect culture of land under such a system must be productive of great national loss.

* By free produce we mean that which remains, after so much has been deducted from the gross produce, as will pay for the expense of producing.

And then, to look upon the subject as a landowner would, it must be apparent that under the one system land would always be offered to a tenant in good heart, instead of, as under the other, out of condition; and instead of suffering a diminished rental from (as Mr. Cooke has it) the unprofitable absorption of a portion of the incoming tenant's capital in the purchase of the outgoing tenant's rights, we believe that he would be able to let his land at even a higher rental, because this portion of the farmer's capital, so far from being unprofitable, will yield him a high rate of interest throughout the whole of his tenancy.

We shall shortly return to this subject, and consider its bearings upon the farmer's capital.

ON THE FARMER'S CAPITAL.

I HAVE no doubt that in Mr. Morton's estimate of a Farmer's Capital he has all the stock his supposed farm will carry, but I much doubt the policy of consuming all food grown upon it, with sheep, thinking a mixture of stock less hazardous, and more healthy, and that a mixture of dung of different kinds of stock lasts longer as manure, and produces better crops. The best kinds of horses may be had at an average of 30*l.* each; but with the strength of a dray-horse, and the speed of a railroad, I cannot conceive one capable of doing the work required of it by Mr. Morton, except on land where one horse is sufficient for one plough. The farmers of the eastern counties would be very glad to learn how to save one-third of their outlay for working cattle, as it would save one-third of their annual consumption of food, and consequently enable them to keep more stock of other kinds. A case which came under my notice as a valuer last Michaelmas, and to the accounts of which I have since had access, will furnish facts as to the value of a Farmer's Capital in my district. The farm contains a few acres under 500, viz., arable 420 acres, wood 10 acres, pasture 60 acres, waste 5 acres. It is all heavy upland, in a good state of cultivation; the stock and implements very good; farmed upon the Suffolk four-course system; and everything upon it was valued on the 6th day of October last, except the corn-crop of 1843, at the following sums, being the actual stock upon a farm not intended to be left, therefore not farmed out.

To be planted as follows, for 1844.

Wheat	120 acres.
[15 acres sown after roots drawn off November, 1843; 25 acres to be sown down with Rye-grass for feed; 10 acres to be sown with Red Clover.]	
Barley	80 ,,
Oats	10 ,,
[55 acres to be sown with Red Clover, White Clover, and Trefoil.]	
Beans and Peas	50 ,,
[10 acres more than usual, a Clover layer having failed.]	
Red Clover	30 ,,
White Clover and Trefoil	25 ,,
[This seed sown 1843 was paid for in the Michaelmas valuation.]	
Rye-grass after Wheat	25 ,,
[To be fed for a time: the land then fallowed for Barley. This seed also paid for by valuation.]	
Vetches (part sown with winter Oats)	25 ,,
[Part to be fed, part mown for horses, and afterwards fallowed for Barley.]	
For Beet and Swedes	40 ,,
White Carrots and Potatoes	5 ,,
Long Fallow	10 ,,
	420 ,,

Stock—as valued Oct. 6th, 1844.

Horses—19 working cattle, 1 rider	£480	0	0		
4 cart colts, 1 riding colt	85	0	0	—565	0 0

Wheel, hand, and sack barrows	3	0	0		
Water-but and liquid soil-cart	25	0	0	—594	10 0
Michaelmas valuation on farm				*850	10 0

* The Straw, Chaff, and Colder, became the property of the incoming tenant on his entry at Michaelmas, he paying for all threshing and dressing the crop, and carting the corn to the usual place of delivery in the neighbourhood. The outgoing tenant was paid in the valuation for all hay and muck made in the last year, all tillage of fallows; also all draining done in the last year, half the expense of draining where one crop only had been taken, for all seeds sown, and the expenses of sowing, all cultivation of the root-crop by hand or horse-hoeing, all rent of land upon clean fallows and fallows for roots, and the root crop became the property of the incoming tenant by his paying for its cultivation.

The foregoing items are from the valuation; those that follow are from estimate and outlay.

Corn for 20 horses (hay being included in tenant's Michaelmas valuation), at 7*l.* 10*s.* each horse .	£150	0	0
Corn for beasts and pigs—40 quarters of Beans and Peas, at 32*s.* per quarter, including grinding . .	64	0	0
	£214	0	0

SEED.

30 quarters of Wheat, for 120 acres, at 50*s.* per qr. .	75	0	0
30 quarters of Barley, for 80 acres, at 30*s.* per qr. .	45	0	0
5 quarters of Oats, for 10 acres, at 20*s.* per qr. . .	5	0	0
9 quarters of Beans, for 35 acres, at 30*s.* per qr. . .	13	10	0
7 quarters of Peas, for 15 acres, at 30*s.* per qr. . .	10	10	0
Clover (red), seed for 40 acres, at 6*d.* per lb., 15 lbs. to the acre, 600 lbs.	15	0	0
White Clover and Trefoil, for 25 acres, at 9*d.* per lb., 15 lbs. to the acre, 380 lbs.	14	5	0
Beet-root, seed for 20 acres, at 5 lbs. per acre, at 1*s.* per lb., 100 lbs.	5	0	0
Swede and White Turnip seed, for 20 acres, at 9*d.* per lb., 5 lbs. per acre, 100 lbs.	3	15	0
32 sacks of Potatoes, of 3 bushels each, at 4*s.* per sack, for 4 acres	6	8	0
6 lbs. of white Carrot-seed, for 1 acre, at 4*s.* per lb. .	1	4	0
8 quarters of Vetches, one quarter winter Oats, for 25 acres	21	18	0
4 sacks of Rye-grass, at 1*l.* 6*s.* per sack, for 25 acres .	5	4	0
	£221	14	0

The following items are taken from the outgoing tenant's payments in the past year, and I consider them customary expenses which vary but little in their annual amount.

Gross Rental	£805	18	6
Hand labour	850	0	0
Tradesmen's Bills, paid quarterly .	97	13	0

SUMMARY.

No. I. Working cattle, riding horse and colts	£565	0	0
II. Neat cattle	392	0	0
III. Sheep	348	10	0
IV. Pigs	87	10	0
V. Dairy Utensils	33	5	0
VI. Implements	594	10	0
VII. Corn for horses, beasts and pigs . .	214	0	0
VIII. Seed	221	14	0
IX. Valuation to outgoing tenant . .	850	10	0
X. Hand labour for one year . . .	850	0	0
XI. Gross rental	805	18	6
XII. Tradesmen's Bills	97	13	0
	£5060	10	6

The tradesmen's bills being paid quarterly, 5*l.* per cent. is taken off them for discount. The sum of 5060*l.* 10*s.* 6*d.* shows the amount of capital employed on a farm of 500 acres in the county of Suffolk, and is rather more than 10*l.* per acre. More stock might be kept upon it, and in some seasons more has been kept, by consuming more corn or oil-cake, which would increase the outlay; for the present year the amount given in head No. 7 is thought sufficient to keep the land in fair trim.

If this account of capital actually employed is thought to be information worthy of your notice, the purpose of the writer will be answered by imparting his mite of practical knowledge upon the subject, to any member of the farming community who may require it.—*A Farmer and Valuer.*

GEOLOGY AND AGRICULTURE.

(*Concluded from p.* 249.)

The action of igneous matter upon sedimentary strata also induces great changes in their chemical properties, sometimes by imparting new substances sublimed from the interior of the earth, but not unfrequently by a re-arrangement of their component parts, without the addition of any new element. Modern chemical research has shown that there are some substances containing the same elements in the same proportions which possess very different properties, dependent probably on the forms in which their particles are grouped. Geology furnishes us with cases in which, without causing actual fusion, the vicinity of igneous matter has produced such freedom of motion among the particles of sedimentary deposits, as to allow them to re-arrange themselves into crystalline products. The case described by Professor Henslow, in Anglesey, in which garnets and analcimes have been formed in a shale of the carboniferous series, near its contact with a dike of augitic trap, without obliteration of the organic remains, is of this kind. Not far from it, on the opposite shore of the Menai, a similar augitic mass has produced changes on the marl and conglomerates of the new red sandstone series, which I have described in the Journal of the Geological Society of Dublin. The changes effected are—1st. The conversion of a loose conglomerate, composed of fragments chiefly felspathic, imbedded in a red argillaceous base with seams of marl, into purple and gray stony masses, undistinguishable in hand specimens from the coarser slates and grauwacke of the least indurated portions of the slate series; 2d. Conglomerates in which the fragmentary character predominates, but the felspathic matter which originally formed porphyretic crystals in the pebbles of the conglomerate, has undergone a re-arrangement into crystals lining cavities which have been formed in those pebbles, while crystals of glassy feldspar shoot through the originally argillaceous base of the conglomerate. These altered portions resemble some of the felspathic conglomerates of the Cambrian series. 3d. We have the argillaceous portions in close junction with the igneous mass, melting down into augitic rocks finely and coarsely crystallised, and yet retaining traces of their original sedimentary lines. The last stage of the alteration of the coarse conglomerate gives as its result an augitic trap with a concretionary structure, resembling some of the hornblende compounds on the flanks of Cader Idris. It is obvious that, were the altered portions of this rock of sufficient extent its Agricultural character would be very different from that of the unconsolidated red argillaceous conglomerate in its original state.

The slates and sandstones of the Cambrian series yield soils very different from decomposed hornblende rocks; but in the neighbourhood of Dolgelly, we find that the changes represented by the stages of alteration in the conglomerate on the Menai above mentioned, have been produced on a large scale. We have there a considerable extent of rock possessing the lithological characters of greenstone and felstone *, and yet retaining traces of the original lines of deposit; and we have a still larger extent of greenstone and other igneous rocks, with a concretionary structure, resembling the augitic rock which has resulted from the fusion of the red conglomerate on the banks of the Menai. The fossiliferous rock at Bodean, not far from Pwllheli, mentioned by Professor Sedgwick, in one of his recent communications to the Geological Society, is an altered grauwacke sandstone, which has assumed a rude columnar, and jointed structure, like basalt; and like basalt decomposes from the action of the weather, in concentric layers. On a fresh fracture it exhibits a light-blue colour, and suberystalline structure, the lines of deposit very apparent, and the embedded shells not at all distorted. On exposure to the weather, it changes, in the course of a very few years, to a brown colour, and decomposes rapidly into a sandstone, so friable that I was referred to it, by a person in the neighbourhood, as a case of shells, contained in the sand of the northern drift, of which I was in search. As atmospheric action does not produce such rapid effects on the unaltered fossiliferous sandstones of the Cambrian series in that part of Wales, the metamorphic process to which this rock has been subject, must, in this case, have increased its capability of forming soil, which would possess the characters of that derived from basalt.

As a general rule, the upper parts of the palæzoic series are less indurated, and more capable of forming fertile land, than the lower portions. The old red sandstone, however, of Herefordshire, and the slates of Devon and Cornwall, both belong to the upper, or Devonian division of the series; and the soils derived from the latter are less fertile than the former, principally from the induration they have undergone from the vicinity of igneous masses, which have impressed upon them so much of the characters of the older slates, that they were for a long time classed with them, till their fossil contents established their true relations. In the Alps, in the same manner, we find the argillaceous portions of the oolitic series, so highly inclined, and so much indurated, as to assume the characters of the slate series, and only to be recognised by their organic remains. In Russia, on the other hand, Mr. Murchison found the carboniferous limestone, with its peculiar fossils spread out in horizontal beds over an extent of more than a thousand miles, with the soft, incoherent character of a tertiary limestone. It is clear, therefore, that there are many circumstances besides aspect, elevation, and latitude, which will materially modify conclusions as to the fertility or sterility of soils, founded on the nature of the rocks on which they rest, or the colours which they bear in our geological maps.—*J. Trimmer.*

WOODEN SHOES.

BY MARTIN DOYLE.

(*Concluded from page* 250.)

In France, the ploughman walks between his stilts in wooden shoes; the carter travels many miles in them; the gardener never goes without them in winter; and every spade-labourer uses them at his work. The English heavy-soled bob-nailed buskin is not a bad winter article, but in summer it is a dreadful incumbrance; it cannot be kicked off in an instant, like the sabot, leaving a nice light slipper (so comfortable for one's corns) in its stead; nor is it supplied without great expense. The Lancashire clog is very cumbrous and very hard, and admits of no listing shoe inside; and, in my opinion, both on this account and the greater cost, it is very inferior to the sabot. To bring wooden shoes into general vogue among us, the children of the poor should be first familiarised to the use of them: if accustomed at an early age to wear them, they will become unwilling to part with them in the succeeding stages of life.

Young, active, grown-up persons of either age will probably object to them at first, as crippling their movements; and yet, where are more agile persons than the youth of France, most of whom wear them? But if men and women, whose jumping and running days are over, or working people employed at stationary labour, were presented with them, they would in a short time be convinced of their excellence. "Keep the head cool, and the feet warm," is a maxim of health, the correctness of which elderly and delicate persons of all ranks admit; but, alas! at the present price of leather shoes, those who are very poor must neglect the advice, unless they will wear wooden shoes.

I have observed the mode of making the sabot, which is very expeditious. The pieces of wood, cut into the required length and breadth, are taken up, in succession, by a workman, who stands at a strong bench, with a small sharp adze in his hand; with this he rudely forms the outside, leaving the heel high and narrow, like that of a fashionable boot, with a hollow for the centre of the foot underneath. He then completely finished off the whole of the exterior surface with a long sharp paring-knife, fastened at one end of his bench by a joint, and crossing over to the other, and worked somewhat in the way of the blade of a Root-cutter or Hay-knife.

This part being finished, he hands over the blocks in pairs to another workman, who fixes them firmly in wooden vices on his bench, at right angles to his front; he then takes a large gimblet, and screws out the part where the heel of the foot is to rest, and makes another circular opening in the fore part; after which he scoops out with an auger the entire of the interior, and thus forms the shoe in the shape of a child's boat.

The sabots (such as the peasants wear) which are not intended to be furnished with straps across the instep, and are to be worn without any other kind of shoe on the foot, are formed with less opening, like half-decked boats, and from being roofed, as it were, over all the fore part, they do not require the transverse ligature. They are either covered with black varnish, which gives them the appearance of leather clogs, or left in their natural colour, which resembles untanned deer-skin, if the Walnut or Beech of which they are made be much variegated. For ladies' use, (as substitutes for clogs,) they are beautifully made to resemble leather neatly plaited at the toe part. These, upon a small foot, look extremely well.

The wooden shoe has been used in France from a very remote period; it was probably introduced there by the Romans, who were acquainted with the use of it.

This cheap and useful description of shoe having maintained its *footing* in so civilised a country as France for many centuries without disparagement, is a sufficient reason for inducing my countrymen to adopt it also. The only cases in which I can conceive them a decided incumbrance, would be upon a road, or in crossing a shaking bog, where a light pair of heels is indispensable. A heavy person in sabots might be swallowed in a quagmire before he could extricate himself from them, and Captain Starlight's men would often be overtaken by the police if they moved out in their midnight maraudings in the sabot, the very noise of which would be an intimation of their movements, which might possibly cause them subsequent inconvenience.

* Felstone—a happy term recently introduced by Professor Sedgwick, as a substitute for that of compact felspar.

ON AGRICULTURAL EXPERIMENT.

In a late Number I made some remarks upon the quantity of land necessary to be employed in experimenting with artificial manures. There are a few more precautions necessary to be observed, the neglect of which is likely to produce a failure in the results. The substances employed should be pure. The adulteration of manures is carried on to an extent that few are aware of, and the farmer has thus been subject to a most gross system of imposition. I have rarely met with a sample of nitrate of soda in the hands of a farmer, that contained less than 30 per cent. of impurities, chiefly common salt. Guano is adulterated with sand and clay; sulphate of ammonia with gypsum; soot with dust and ashes. The soil that is selected for experiment should be in an exhausted state; salts which produce a remarkable effect on a soil full of dung, have often little effect upon the same soil when poor, and *vice versâ*. When Turnips are the object of experiment, the greatest care should be taken in the preparation of the land. It should be reduced to the finest tilth possible, by ploughing, rolling, &c. Dung has a tendency to lighten the soil, and it also yields, during decomposition, a vast quantity of gaseous matter; when artificial manures are employed, the plant is obliged to procure these from the soil and atmosphere, and the power the soil possesses of condensing gaseous matter depends entirely upon the state of mechanical division.

It would contribute much to advance our knowledge of the action of artificial manures, if the experiments were continued upon the same space of land during successive years. The problem would then be solved, whether a plant can supply itself, year after year, with organic matter, when inorganic matter only is supplied. I found that the ashes from 5 cwt. of dung, produced an equal weight of Turnips, as 5 cwt. of dung unburnt; but whether the succeeding crops will be as good, remains to be proved. The great expense of carriage prevents the dung which accumulates in large towns from being employed, except by those farmers who live within a few miles; but if the ashes proved equally beneficial, the weight would be reduced nine-tenths, and the expense of carriage completely removed.—*J. B. Lawes.*

ON MINERAL AND INORGANIC MANURES.

No. XIV.

By Professor Charles Sprengel.

(*Continued from page* 235.)

In some parts, marl is strewed also over pasture-fields, by doing which, it is trampled into the soil by the cattle, and soaked into it by the rain-water.* This process may be safely resorted to, especially with a marl containing much protoxide of iron. The application will improve the pasture, as we have already seen that Grasses and Clover are made by marl more nutritious and palatable to the cattle. At other places, it is conveyed during the winter on fields planted with Red Clover; and in the spring, the marl and the Clover-sward are shallow-ploughed; or it is spread during winter on the Rye-crops in small heaps, then left until the spring, and then strewed over the field. Very often also, old pastures are manured with marl after they have been ploughed. In this case, the marl will find much vegetable matter and coal of humus for decomposition, and thus improve the subsequent crops.

Marl is also placed in large heaps alternately with layers of vegetable mould, in which state it is left for a year or eighteen months, after which the mixture is used for the manure of sandy soils. The long and close contact in which the humus (often very rich in carbon) is placed with the lime of the marl, will cause it sooner to be decomposed, as would more slowly be the case if mould and marl were conveyed separately on the field. It is, perhaps, unnecessary to add, that, for the mixing with

* And buried by the worms.

mould, earthy marl only can be used, and that it is to be brought in the heap in as small pieces as possible, and the layers not to be made too thick. If marl is used conjointly with manure, (as is done in some parts,) the result will be most satisfactory. Still, we must guard against taking too much manure, else the Corn will be laid.

The quantity of marl to be brought on a certain area cannot be stated accurately (see p. 325), for this is to be decided as well by the quality of the soil as by that of the marl, which both vary. Of clayey marls, containing 12 per cent. carbonate of lime, 3000 cubic feet are brought on one Magdeburg acre of sandy soil, whilst 80—100 cubic feet will suffice for the same area if the marl be very calcareous, and, moreover, very powdery. Argillaceous marl will also serve to improve the soil mechanically, whilst calcareous marl has merely to decompose the carbonic humus, and to supply the crops with lime, &c. As by the use of marl large tracts of land may undoubtedly be more speedily improved in strength, and brought to productiveness, it would be well if every large proprietor would examine his land, and see whether there be no strata of marl on it. If it be not too far below ground, its existence may be ascertained by some deep-rooted plants; the natural growth of the Lucerne will indicate it; and at places where there are layers of marl, the following plants also will be generally found growing: Brambles, Coltsfoot, Hawthorn, Blackthorn, Wild Roses, &c. The more certain way, however, to ascertain the existence of marl strata is by boring the ground, and testing the soil brought on the surface by some drops of nitric or other mineral acids, and if there be any effervescence, we may be sure of having found at least a stratum of a calcareous mineral, and further chemical analysis will show whether it has all the properties desired. If a marl stratum has been found, its thickness should be ascertained, for the sake of deciding whether it be worth while to excavate it, as, generally, marl lies so deep, that much soil is to be removed before we can arrive at it. To avoid this, at times, a regular miner's pit may be sunk; which, however, is so expensive, that the marl must be of very good quality to repay the outlay. At other times, marl may lie so deep, and in such a wet position, that the spring-water must be carried off by pumps; which, again, will not pay, if the marl be not very good. In alluvial soils, the quality of marl will generally improve with the depth, and the lower strata will be richer, not only in lime, but also in potash, common salt, gypsum, phosphate of lime, &c. In this case, the deepest will be the best, and will not require so great a quantity to produce the same effect as that of the upper strata.

It is advisable to give to marl-holes as convenient an ingress and egress for the waggons and carts as possible, and the soil cleared away is to be thrown back where the marl has been already taken out. Strong marl may be broken of with pick-axes, whilst earthy marl may be worked off with a strong three-pronged fork, which is thrust into the ground. In making a marl quarry, we must guard against undermining the ground, else by the falling-in of the side-walls the workmen may be injured. In order to be sure that we convey to our fields the substance needed, it is well to examine the different strata chemically, as, at times, the rock may be so worthless that it is better to throw it away on the waste heaps.

ON THE CULTIVATION OF FLAX.—No. IV.

Among the Associations now in operation for the encouragement and promotion of improvement in rural affairs, Flax cultivation has not been neglected. Allusion has been already made to the Belfast Society, the first of the kind; which, although little more than three years in operation, has already effected a marked improvement throughout the Flax-growing districts of the north of Ireland. That Society wisely sent over a number of intelligent young men to Belgium, whence the finest qualities of Flax had hitherto been procured, and also brought over labourers from that country to introduce the Belgian system of management. The experience of a single season showed the sound policy of this arrangement, and the important change it effected; but, above all, that Society exerted its influence to introduce the Factor-system (if I may be allowed the term), feeling assured that without this peculiar feature the object in view could not be effected—that of enabling the home grower successfully to compete with the foreigner. To this important subject, therefore, the attention of those anxious for the extension of Flax culture in this country should be devoted in an especial manner, as one of the most important means of effecting their object. Nor will this be found difficult to effect, as the Continental factors will readily come over to this country, provided a proper field is before them for the employment of their capital. On this subject the following extract from a recent Report of the Belfast Flax Society is deserving of attention.

"Of the factor system, your committee have the satisfaction to announce, that this peculiar and new branch of business has been commenced amongst us, under the most favourable auspices. The system being, that capitalists purchase the Flax while on the ground from the farmer, who undertake the pulling and all subsequent treatment of it, which is performed under the immediate superintendence of competent persons, and is attended with many advantages. The farmer obtains a fair price for his crop, without the risk of spoiling or losing it. He is thus put in funds; and being relieved of a large portion of his labour and anxieties, he can give undivided attention to the other products of his land, and is enabled to hold over till the most judicious time for selling, instead of being compelled to bring to market whatever was first disposable, which he had to sell at any sacrifice, to meet his outlay in labour, rent, or other pressing necessity. But still greater advantages are opened to him; he has opportunity of seeing how these gentlemen and their experienced agents handle the crops, so as to realise a profit after paying him for it, which he possibly might not have realised for himself, including all his expenses and troubles. The industrious will be stimulated to imitate the improved mode of management they see practised, and the small farmers, more especially, may learn to reap all the benefit of that system they have exemplified to them by the Belgian factors and labourers, by introducing hand-scutching, on right principles, in their families, during seasons that otherwise offer no profitable occupation of their time.

"Gentlemen farmers may also be encouraged to sow Flax, who could not undertake the trouble of superintending its management, or conveniently arrange for its accommodation.

"This new branch of business has been undertaken by two enterprising gentlemen, thoroughly acquainted, by long experience abroad, in every detail of its management; and they have realised this season every expectation of its great advantages to the country, by the trial they have given to the system.

"Mr. Welch, from Belgium, early in the year, located himself at Armagh, and commenced training labourers, under Belgian factors, and he purchased, at the proper season, the standing crops in that neighbourhood; but, losing the services of his principal Belgian superintendent at this critical period of his operations, he limited his purchases to some fifty acres.

"Mr. Galbraith, of Belfast, purchased in the neighbourhood of Lifford and Strabane, some two hundred and fifty acres, which were allotted to the management of Dutch and Belgian factors; and a spirited example has been thus given, which your committee doubt not will be followed up extensively; and so strongly impressed have been your committee with the importance of these gentlemen's undertaking to the interests of the country, and of the great benefits likely to arise therefrom, that it was resolved, at a late meeting, to mark their sense of it, by presenting them with a gold medal each (as a memento of the estimation your committee entertain of it, and of their having been the first parties to introduce this new and important branch of business amongst us), accompanied with their best wishes, that their speculations may turn out as successful as they could possibly anticipate, and more substantially remunerative of their exertions."—*J. Sproule.*

ON THE APPLICATION OF CHEMISTRY TO AGRICULTURE UPON RATIONAL PRINCIPLES.—No. XIV.

(*Continued from p.* 235.)

We have seen in the previous pages that the principles of manuring plants must be founded upon the chemical nature of the soil, and on the food wanted by the plant. We have also seen that a plant, to be perfected, must have all, not only part of the elements of organic structure; that as an animal will not live upon either azotised or non-azotised food alone, so the analogy exists in vegetable life, and a plant will not live alone upon nitrogen in ammonia, carbon in Straw, alkali in the nitrates, oxygen or hydrogen in water, silex in sand, phosphorus in bones, or the sulphur and iron in the earth, but that the union of *all* these elements or principles is necessary. We have also seen that plants, especially those destined for the use of man, have the power of depositing certain principles according to the amount of the necessary elements supplied to them.

Now, of all the constituents of plants, that which is deposited in the cells of the seed of Cerealia—Wheat, Barley, Oats; and of the Leguminosæ—Beans, Peas; and in less quantity in the tuberosa, is the most important to man and the animals dependent upon him: I mean albumen, which, in the form of gluten, supplies the azotised constituent of Wheat. Surely then the great object of the farmer is to increase this principle in his Wheat by a judicious system of manuring or feeding his plant. The Straw and the dung of his farm-yard will supply abundance of food for the fabric of the plant; but if he wishes to increase the weight, quality, and quantity of his grain, he will find all the elements necessary for his purpose in urine.

In urine we have almost all the elements of the food of plants. We have, in human urine, urea, containing azote, 3 per cent.; other salts, containing nitrogen, 1.7 per cent.; sulphates of potash and soda, .610 per cent.; phosphates .46 per cent. And yet, is it not astonishing that the collection and use of urine as a manure should be so much neglected—that hundreds and thousands of pounds of Wheat are daily lost and destroyed in the form of uncollected urine. It is equally clear that of that retained by the Straw in the farm-yard, one-half or more of the nitrogen is lost by evaporation during the decomposition necessary to convert the Straw into manure. The phosphates and potash remain, it is true, and their value is great, but the elements of albumen in the urea are lost as carbonate of ammonia by volatilisation.

To increase the quantity and quality of Corn, then, we must collect all the urine we can from every cottage or house or town in our neighbourhood; and, having procured it, we must prevent loss from decomposition by fixing the volatile salt of ammonia.

Ammonia is composed of—

Nitrogen . .	14	or one equivalent.
Hydrogen . .	3	or three equivalents.
	17	

To the uninitiated in Chemistry I may observe, that the term equivalent is expressive of the proportions in which bodies unite with each other; and that all bodies unite chemically with each other either in the proportions expressed by their equivalents, or in multiples of them. All simple bodies have a fixed combining proportion or equivalent, as nitrogen, 14; hydrogen, 1. And the equivalent of compound bodies is expressed by the sum obtained by adding the combining numbers of the simple bodies of which it is composed; thus, ammonia formed as above,—of nitrogen 14, hydrogen 3,—has 17 for its equivalent, in which proportion alone it will unite to form salts with acids; thus, carbonate of ammonia is formed of—

CARBONIC ACID:—
Carbon 6, one eq. + oxygen 16, two eq.—22 eq. of carb. acid,
AMMONIA:—
Nitrogen 14 + hydrogen 3 . . .—17 eq. of ammonia.

39

And 39 is the equivalent or combining proportion of the carbonate of ammonia.—*C. R. Bree, Stowmarket.*

Home Correspondence.

Potato Planting.—It will be found, speaking from years' experience on a small scale, that using the largest size Potatoes, uncut, for sets, and planting them in rows one yard apart, the sets being two feet and a half from each other, is the right way to plant Potatoes; the produce will be one-third greater at least, the small Potatoes will be very few, and the crop escape the effects of drought, should it come early in the spring, and escape, because the skin is not broken, the attacks of wire-worms. The above distances are for the main crop; for an early one the distance should be 27 inches by 18, and the rows not moulded up. Moulding up Potatoes retards the formation of the tubers. Should any one not like to trust his whole crop to such proceedings, let him try a small portion of his Potato plot by way of experiment, and I have no doubt as to the ultimate success.—*W. H., Reading.*

Potatoes.—I think the loss and disappointment from both curl and rot may, in 99 cases out of every 100, be prevented by the exercise of a little management and common sense. In proof of this I will adduce a few instances. In the vicinity of Edinburgh, where excellent Potatoes are grown for the city market, it used to be customary to have seed Potatoes from the southern counties of Scotland every second or third year, to prevent curl; the dry or mealy quality—constituting the excellence of the Potato to most palates for table—being the cause of curl. Again, when a young man, I remember being solicited by a tradesman in a midland town for some seed of a favourite pink-eyed Kidney to plant in his pet-plot of ground in the suburbs. They all curled; the fact was, they were "very mealy," as it is called. 3dly—I knew a market-gardener in a small way, near Edinburgh, who was famed for his early Potatoes. His practice always was to dig up and put away sufficient for next year's seed, before they had completed their growth; they were full of sap and kept so. I have myself had early Potatoes completely stopped in their growth by drought, before the period of natural maturity. They were waxy in quality, not good to eat, but made very good seed. Again, an old master of mine who had lived in a situation on the west coast of Argylshire, told me the practice there, was to dress the ground where the portion of Potatoes intended for the following year's seed were grown with fucus from the sea shore; the quality of the produce was exceedingly waxy and uneatable, but this made them all the better for seed—in fact it was done purposely. So much for curl. Now for rot. A neighbour and friend of mine some years since, happened by chance to have a very good crop of Potatoes that were planted late; but from that he got a crotchet in his head that the lateness was the cause of the superiority of the crop, so that Potato planting afterwards became an habitually protracted process with him. Several years since, about two acres of land was well prepared, well dressed with farm-yard manure, and planted; but on the advance of the season, not above a third of the lots vegetated, and many very weakly. My friend, in a disappointed mood, said to me, "I wish you would examine these Potatoes; they come up very bad, and I do not know what is the matter." The fact was they had been stored in a Potato-house all winter, part of a large mass, that had been turned over and deprived of growths two to three inches long before they were cut into sets for planting. Their vitality was quite exhausted before they were in contact with the earth. Now, Sir, how easy it is to guard against these painful results, I leave any one to judge. Soils, manures, and seasons, no doubt, will affect a Potato crop in various ways; but, in my opinion, will induce neither rot nor curl, if a little care is taken to prevent it. Seed Potatoes should not be of a mealy quality, nor should they be suffered to heat when stored; nor should the planting be protracted till the Potato has exhausted its vital powers in attempts to grow without soil; nor should the sets be kept more than 24 hours out of the ground after they are cut.—*Quercus.*

Potatoes.—I have just taken up some Potatoes which have been kept in the ground all the winter, and which are quite sound, and at the same time very good tasted, at which I am rather surprised, and I think it would be a good experiment for some of your farming readers to try whether they will not keep better in the ground than in the Potato-pits; for in the latter they are, in many instances, one mass of putrefaction.—*H. P. T.*

Glass Milk Pans.—Upon reading Captain Carr's letter, published in the Royal Society's Journal, vol. i., 1840, I was struck with the impression that the idea was not only good, but that glass is a better material for the purpose than any other, and, taking all things into account, less costly, *i. e.*, upon the assumption that the price here would not be more than three times that stated in his letter. I therefore felt but little hesitation in ordering for my dairy, which consists of rather more than

20 cows, two dozen of them from Messrs. P. Oberf and Co., Hamburgh, through Mr. George Rahn, 4, Crescent, Minories, London, to whom I have much pleasure in recommending any gentleman who may feel disposed to do as I have done. The entire cost to me stands as follows:

	£	s.	d.
Cost price, 1s. 2d. each; Package, Commission, &c. &c., Hamburgh	1	11	6
Duty paid in London on 1 cwt. 26 lbs. of glass, and excise	2	11	9
Agency, Entries, Lighterage, Landing, Porterage, Sufferance, Wharfage, &c.	0	18	4
Carriage from London to Ipswich by 'Orwell' steamer	0	2	6
Carrier to Wickham Market	0	1	6
	£3	5	7

I have had these pans (which all bore the journey without a flaw) in use about a fortnight, and am convinced that they are better than anything else of the kind in use. Cleanliness, coolness, and economy are the three principal requisites in a dairy—to which I am much mistaken if these pans will not materially contribute. The cost price at Hamburgh is something more than I was led to expect, and the duty excessively high,—much higher than I calculated upon at the time of sending out the order. One material saving is, that they require no scalding—merely washing in milk-warm water, then rinsing in cold, and set in a rack to dry. A good-sized kettle-full of boiling water from the kitchen-fire is sufficient for my dairy, except upon churning mornings.—*C. Welton.*

Books.—The Lytham Agricultural Society has commenced what Lord Brougham pointed out 20 years ago, in his practical observations upon the education of the people and their employers, and it is to be hoped that other Societies will adopt the same plan, so that the ploughman and others employed in the working the land, may read and judge for themselves, upon subjects connected with their business. At a late ploughing-match, at which prizes were offered by this Society, it was resolved to present them partly in the form of books, and partly in money. If this example were followed it would undoubtedly be productive of beneficial results.—*Facile*

Rot in Sheep.—There has been some discussion lately between Mr. Grey and Mr. Doyle respecting the foot-rot in sheep, which is a very injurious disease. But there is another malady still more fatal, to which sheep are liable, called the plyce, or rot in the liver. There are various opinions respecting the real cause of both diseases. Most agree, however, that they are originated somehow or other by damp pasturage. The following is an extract from Mr. Brightwell's lecture, taken from the *Norwich Mercury*, and which refers to the latter disease:—Mr. B. "alluded to the description of animals found within others, principally those which infect sheep; the fluke and sandore were among the number, which destroyed thousands of sheep annually. The general impression was that the rot was contained in certain plants. There was a place near Cossey which he said had the name of having the rot, and nobody would buy a sheep, or hare, or other animal which had been fed upon it." Mr. B. further observed, "there had been three trials about the rot question at Wymondham, which went before a jury three times, and the great point to determine was, whether the sheep had the rot when first sold, or whether the person who bought them put them in a field where the rot existed." I know several fields, or rather parts of them, at Cossey, where it is said the rot exists, and they are all damp; but the question is, in what does it exist? The general belief is that it exists in a plant called the Rot-weed, and that that plant will affect any animals that graze upon it, even pigs. This, of course, is the same weed mentioned by Mr. Brightwell, and so far the belief may be correct. Sheep may eat the weed while it contains the eggs of insects, whose larvæ, being bred in their stomachs, find their way into their livers, and become the plyce or fluke, or in other words, the rot. I cannot say what is the best cure for the disease; mercury is named, but prevention is better than cure. It may be said, why not root out the weed, and cleanse the land of rot? It must be borne in mind, however, that the insects may deposit their eggs on other weeds, even the grass, nay, perhaps the sheep themselves, in a similar way as the insects do which cause the batts in horses. There may be something suitable for the insects in damp meadows, hence drainage must be of great use; but it may be urged that when animals are kept in houses and fed upon much green or wet food, they are subject to the rot in the liver—rabbits, for instance, and perhaps sheep also. In such cases the insect's eggs may be amongst the food, or else the insects find their way to it. It is worthy of remark that much green food renders animals' stomachs more fit to ensure the growth of the larvæ of insects; likewise that there are various opinions respecting how "animals are found within others." The vulgar notion seems to agree with a scientific one, viz., that the eggs or larvæ of insects are drunk in water. The strongest proof of this I know, is in the relation of the woman at or near Cork, who had larvæ of the churchyard beetle in her stomach. By an absurd notion she drank a mixture of water and clay taken from a priest's grave! I believe there are doubts whether the larvæ within animals ever become insects, or arrive at the pupa state. In the case just noticed, I think it is said they did so; if not, that foolish woman must have taken great draughts, at various times, to produce the vast quantity of larvæ which came from her stomach. Although larvæ may come from animals' stomachs with the excrements, and afterwards become perfect insects, still I cannot see how they can pass from the liver. Whether my views on the rot in sheep's livers be right or wrong, I am safe in saying that the animals originally belonged to high and dry districts, and the nearer their pasturage comes to that, the less liable they will be to the rot, both in foot and in liver. If the reader happen to know anything respecting the history of the insects that produce the "fluke and sandore," perhaps he will have the goodness to mention it.—*J. Wighton.*

Mixture of Soils.—In many districts there are varieties of land which, by an equitable exchange, make each other productive, without the addition of manure. For instance, sand and clay: neither of these by itself is so fertile as when they are mixed together. All gardeners know the craving nature of a sandy soil, and the almost impossibility of doing anything with clay in its natural state; yet men are found who obstinately toil on with each separately, when they have both opportunity and facility of bringing them together, thereby saving both present and future outlay.—*Falcon.*

Transplanting Swede Turnips.—Though your correspondent, "C. G. Sidy," page 142, has never had the opportunity of trying the transplanting of the Swede Turnip, he need be under no fear of the result. The Lancashire farmers have found it a plan far superior to sowing the seed on the ground of the future crop, being quite sure of getting a full and heavy crop. When they are transplanted it gives more time in preparing the drills where they are to stand, and less time is taken in planting them than in thinning drills where they are sown to stand, and a great saving is effected in the seed. I saw a field last year of four acres, and the seed was sown in the drills; the whole was attacked by the fly and completely destroyed. The owner of them applied to his neighbours for plants, which he got, and it was supposed that it took about a quarter of an acre seed-bed to plant the drills in the four acres. The upper parts of the leaves were cut off before they were planted, to prevent them being shaken by the wind. These plants were planted in the drills where the seed had been sown and destroyed by the fly, and a finer crop was never produced than grew from them.—*M. S. G.*

Guano.—Having prepared the accompanying directions for using Guano, for the information of Sir Charles Lemon's tenantry, it occurs to me that it might be made serviceable to others by publication. 1. It should never be applied in contact with seeds, as it kills them immediately they begin to vegetate.—2. It should be mixed as equally as possible, with about four times its bulk of finely pulverised earth, burnt clay, turf, or peat-ashes, after they have become cold. If sand is used, about twice its bulk will be sufficient.—3. The quantity per acre may vary from two to four cwt., according to the nature and quality of the land. Recent experiments have shown that a quantity which proved highly beneficial in poor soil, became deleterious upon land previously rich and well manured.—4. The best time for applying it is shortly after vegetation has commenced, and immediately before rain, or during damp warm weather.—5. The best mode of application is, to divide the quantity per acre into two or three equal portions, and sow them broadcast at intervals of about ten days, or a fortnight.—6. For small allotments it may be more convenient to use it in a liquid state—in which case, mix 4 lbs. of guano with 12 gallons of water, and let it stand for 24 hours before being used. The same guano will do for mixing again with the same quantity of water, after the first is drawn off.—*W. B. Booth, Carclew.*

Dibbling Beet.—I have had garden Beet dibbled, and it has answered well. I should decidedly follow the system myself. I purchased last autumn from a person who had a small allotment, a quantity of field Beet; part had been sown, part was dibbled, being the thinnings of some person's seed-plants. He informed me that the weight of the latter per rod was large, although the roots were not all approaching in size to the seedling plants.—*Toby.*

Carrots and Guano.—One of your subscribers asks about guano being a good manure for Carrots. It is good for everything if properly used, but no seed is more easily killed by it than that of the Carrot. The guano must be well worked into the soil to render it safe.—*W. D. F.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A WEEKLY COUNCIL was held at the Society's house, in Hanover-square, on Wednesday last, the 24th of April, present, His Grace the Duke of Richmond, K.G., in the chair, Lord Carew, Hon. G. H. Cavendish, M.P., D. Barclay, Esq., M.P., T. R. Barker, Esq., J. R. Barker, Esq., W. R. Browne, Esq., E. Buller, Esq., M.P., Rev. T. Cator, H. Colman, Esq., E. D. Davenport, Esq., J. E. Denison, Esq., M.P., Capt. Forbes, R.N., H. Gibbs, Esq., B. Gibbs, Esq., H. I. Grant, Esq., C. Hillyard, Esq., Rev. E. C. Keene, F. Manning, Esq., A. Ogilvie, Esq., H. Price, Esq., Prof. Sewell, H. B. Simpson, Esq., J. S. Stanhope, Esq., W. R. C. Stansfield, Esq., M.P., Rev. T. S. Turnbull, T. Tweed, Esq., and H. Wilson, Esq. J. Mott, Esq., of Portswood Lodge, Southampton, was elected a Governor, and the following gentlemen members of the Society:—

Woodward, Thomas, Wickstreet, Hailsham, Sussex.
Deverell, John, Purbrook Park, Portsmouth.
James, Edward, Banoch Lodge, Carlisle.
Gearing, Thomas, Brown-Condover, Alresford, Hants.
Stubbs, Henry, Ropley, Alresford, Hants.
Pellatt, Apsley, Knowle Green, Staines, Middlesex.
Vogar, Rev. Thomas S. L., Vicar of Walburton, Arundel, Sussex.
Warner, James, Jun., Curdridge, Botley, Southampton.
Godrich, Thomas, Netley Grange, Southampton.
Harding, James, Upton-Scudamore, Warminster, Wilts.
Parker, Kenyon S., Q.C., 13, New-square, Lincoln's Inn.
Godsal, Philip William, Iscoyd Park, Whitchurch, Shropshire.
Cretney, Thomas, Hampton-Wick, Middlesex.
Collins, Francis, Savernake Forest, Marlborough, Wilts.
Lowe, John, Birmingham.
Atty, James, Penley Hall, Ellesmere, Shropshire.
Plowman, Robert, Beck Farm, Beaulieu, Southampton.
Mott, John, Jun., Portswood Lodge, Southampton.
Winchester, Marquess of, Amport House, Andover, Hants.
Hendy, James, (President of the Cornwall Agricultural Association,) Trethurffe, Truro, Cornwall.
Ware, Samuel, 34, Portland-place.
Warner, James, Harefields, Bishop's-Waltham, Hants.
Saunders, William, Cranbourne Farm, Sutton, Winchester.
Willsher, Robert, Hurstgreen, Lamberhurst, Sussex.

The names of 21 candidates for election at the next meeting were then read.

EYE DRAINING-TILES.—Mr. Wilson, of Stowlangtoft Hall, near Ixworth, Suffolk, presented a specimen of the tiles used for the "eyes" in under-drains, and made at Woolpit, in Suffolk; along with the two bottoms on which the tile is intended to rest. This tile is nearly a foot and a half long, and 6 inches high, having at one end the common shape in its transverse section of the capital letter U turned downwards, with a middle interior width of two inches and a half. From this wider end, the tile, by lateral compression while in the raw unburnt state, had received a tapering diminution of its width to the other end, where the aperture, being reduced to a vertical slit, six inches high by three quarters of an inch wide, all rabbits, rats, and other animals too large to pass through the opening, would be kept out of the drains, and injury from their operations thus prevented.

MODEL EXPERIMENT.—Mr. Barclay, M.P., reported to the Council the progress made at the last meeting in arranging the plan of the model experiment proposed by Mr. Miles for trial by such Members of the Society as could conveniently join in it. An interesting discussion then ensued, in reference to results obtained in the use of guano and farm-yard manure. The Rev. Thomas Cator, of Skelbrooke Park, near Doncaster, had found an application of 300 lbs. of guano per acre to a Potato-crop, strewed upon the ground when they were ready for earthing, equivalent to 18 loads of fold manure applied in the usual way; and having last year manured a Bean crop with guano, pigeon-dung, rape-dust, and fold-manure, he found now the Wheat had come up this spring, a decided evidence of the superiority of guano, on the five lands of the Bean-field to which that manure had been applied:—he considered it as one of the cheapest hand-tillages, while the fold-manure was most advantageously reserved for the Grass and Clover crops.—Mr. Davenport, of Capesthorne, Cheshire, regarded guano as one of the most valuable manures, having now had three or four years' experience of its use; and he considered, in general, that 3 cwt. of guano was equal to 20 tons of farm-yard manure. He spoke of the guano in its unadulterated state, as imported. His own supply had been of the Peruvian guano, furnished to him by Mr. Myers, of Liverpool, at 10*l.* per ton. He believed that the African guano was substantially the same in its general character, but that it contained 25 per cent. of water, while the Peruvian contained only 10 per cent.; and assuming the Peruvian variety as 10*l.* per ton, Mr. Bernays had stated the relative value of the African guano to be as 7*l.* per ton. Notwithstanding the immense quantities already sold in this country, Mr. Myers had informed him that he had at present orders for 3000 tons, which he was unable to supply. The hardest samples are the best; and as it was known to be frequently adulterated with one-third of an inferior quality, it was most advisable to purchase it from a direct importer of the article, and in the original packages. His practice was to apply a mixture of half a ton of finely-worked bones and 2 cwt. of guano, per acre, to a crop of Potatoes or Turnips. He recommended powdered gypsum to be scattered by handfuls in the farm and stable-yards, and mixed with the straw and liquid manure; or should that not be done, then to put layers of it in the manure-heap every three or four feet: by means of this proceeding the ammonia, instead of escaping into the air in the state of gas, was retained by gypsum. By these new systems of manuring, he was quite sure the same results could be obtained at one-quarter the former expense.—Mr. Hillyard, of Thorpeland, near Northampton, would engage in no trial of new manures unless they were susceptible of being brought into general farming use, and the experiments made after a white-straw Corn-crop.—Mr. Gibbs thought that it was desirable to make the trial after a white Grain-crop, whenever the given weight of the Turnips was the point to be ascertained.—Mr. Barclay, Mr. Hillyard, and the Rev. Thomas Cator, then agreed to undertake the trial of the model experiment proposed, and under such conditions as might hereafter be finally arranged.

OX AND HORSE TEAMS.—The Duke of Richmond having called the attention of the Council to the difference of opinion prevalent on the subject of the employment of oxen in ploughing, thought it would be an important topic of inquiry to be instituted by such of the members, residing in different counties, as would undertake to gain for the Journal Committee, actual facts and results of trial and experience in their use, under different circumstances, both as to the difference of expense, and the amount of work performed. An interesting discussion then took place on the comparative advantages in the employment of horses and oxen in farming work, when the Council resolved, on the motion of Mr. E. Buller, M.P., that the following gentlemen should be requested to make inquiries on this subject, and report their communications to the Journal Committee:—Col. Challoner, H. Blandshard, Esq., Rev. T. Cator, C. Hillyard, Esq., W. R. Browne, Esq. The following are the principal points to which their attention is directed:—

1. The age and breed of both horses and oxen, with the time at which they were first put to work.
2. The working condition of the horses and oxen; whether regularly employed on the same farm; and for what period: with a statement of the nature of the soil.
3. The amount of work, whether on road or field, of each pair of horses and oxen; together with remarks

upon the manner in which that work has been performed, and its separate value.

4. The cost of maintenance and farriery of each pair of horses and oxen; including the separate charge for management.

5. The cost, or presumed value, of each pair of horses and oxen, with their gear, when put to work; and their value at the close of the comparison.

6. The comparative number of oxen or horses which are required to do the same work.

7. Whether there is a general tendency in England to substitute the ox for the horse in Agriculture, particularly in ploughing?

8. Whether this tendency exists more in particular counties; and if so, to what motives it may be attributed?

9. Whether such preference has yet done any evident injury to the employment of horses?

10. Whether there has been remarked any deterioration in the breed of horses generally; or if, on the contrary, the mixture more or less of pure blood in all the breeds, has produced a sensible improvement, and a more easy sale?

11. Whether this branch of commerce is failing or prospering in the United Kingdom?

12. Results of trial and observation on any other topics of the inquiry.

Destruction of Rats.—Captain Forbes, R.N., of Winkfield-place, Windsor, having called the attention of the Council to the fact, that many thousand quarters of grain are annually destroyed by rats, proposed that a premium should be offered by the Society, for the best mode of effecting their destruction.

Copies of Mr. Hannam's Treatise on the Economy of Waste Manures, and on the Nature and Use of Neglected Fertilisers; the American Agriculturist, and the *Jamaica Times*, were presented to the Society by their respective authors.

The Council then adjourned to Wednesday next, the 1st of May.

AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

The Annual General Meeting of this Society took place on the 19th inst., at 37, Sackville-street. His Grace the Duke of Leinster in the chair. A draft of the Report for 1843 was read by the Secretary. Some important additions were made to the premiums for draining and improving waste land; and, in accordance with the request of John Hawkins, Esq., it was resolved, that the Agricultural College about to be established at Leopard's-town, near Dublin, shall be under the patronage of this Society.

FARMERS' CLUBS.

Bromsgrove.—At the late meeting of this Club, Mr. H. F. Fardon read a second paper on the subject of Manures. After speaking generally of the action of manures, he brought forward some very interesting matter on the use of salt. "Common salt," he said, "has lately attracted much attention as a manure, and upon light soils it is very valuable. I have received two letters on this subject, containing the actual experience of two thoroughly practical Agriculturists. The first I received from Mr. John Wilson, of Aston Claverly, near Wolverhamptom; the second from Mr. Matthews, of Park Hall, near Kidderminster. The following are extracts:—Mr. Wilson says, 'I have used salt for agricultural purposes many years with success, and am thoroughly convinced of its utility. I am now applying it for Barley on all my lightest soils, containing any considerable portion of vegetable matter, at the rate of five to six cwt. per acre; also on my Wheat of the autumnal sowing on the same description of soils, and at the same rate per acre. I did so last year with great success. I gave it, as in other years, a fair trial, by leaving a strip in each field without the salt, which in every case plainly showed itself in the months of May and June, particularly in the Wheat. We consider our land to bear white Wheat better than red, but in the latter end of May and the beginning of June it is very much more subject to the red rust, a disease very detrimental here, but it is completely obviated by the use of salt, and the sample is much finer, the yield better, and much freer from light or diseased grains when salt is applied. I last year salted a twenty-acre field for Barley, at the rate of 6 cwt. per acre, leaving a strip the whole length of the field without; at harvest the greatest novice might have discovered the difference, the salted being very superior in sample and colour. I last week winnowed 300 bushels of it without a single bushel of light,—a circumstance which does not occur with us this year where salt was not used. This was grown on land which ten years ago was considered not worth cultivating, but being wonderfully improved by the use of bones and salt, it now grows as good Turnips and Barley as any land I have. I think the Bromsgrove Club will approve of salt as recommended for trial in fixing the ammonia in manures. I use it for that purpose very satisfactorily.' Mr. Matthews writes as follows:—'If salt were found only on the shores of South America, and imported here at the price of guano, I think it would be in more general use than it is at present. Its value no one attempts to question, but nevertheless its application is very limited. My experience of its effects is confined to light soils; and, upon such, I know of no article so greatly and so generally beneficial. Its copious use to every description of stock I regard as indispensable. For Turnips, Barley, Clover, and Wheat, it is equally beneficial, used either as a top-dressing or worked into and incorporated with the soil. Nor is it of value only as regards an *increase* of produce, for I have always found the *quality* greatly improved where it has been used largely. The foldyard should have an abundant supply; it should be applied at the least once in every week. Upon Grass lands, whether upland pastures or watered meadows, I have found its use alike advantageous. I have generally applied it in the form of a compost with soils, but I do not consider this as necessary. Last spring I dressed a meadow of five acres with salt and soil, putting on about 30 cwt. per acre of salt, (!) the effect was most convincing both in the Hay crop and aftermath. The sheep and cattle I turned into it had access to an adjoining meadow, and their preference for that which had been salted was really ludicrous; they could not be induced to leave it when it was as bare as a common, while the other meadow had abundance of Grass upon it. Pray do the community the good service of urging the more general use of salt, especially in the Ryeland district. I am satisfied that every man whom you can prevail upon to adopt its use largely, will ultimately thank you for the good you confer upon him.'—These letters," Mr. Fardon said, "afford practical evidence of the value of salt, and I hope farmers on light land will try it. Salt may operate in fixing ammonia by converting the volatile carbonate of ammonia into the fixed muriate, being converted itself into carbonate of soda, a valuable constituent of manure. Salt may also benefit light dry soils by its attraction for water, and it has the effect of rendering herbage more palatable to stock."—The reading of the paper was followed by a long discussion, chiefly on the use of salt as a fixer of ammonia and as a manure.—In reply to an inquiry made by Mr Wright, Mr. Elliott stated that when common salt and carbonate of ammonia are brought together in solution a double decomposition takes place.—Mr. Maund quoted Mr. Solly to the effect that such action would only take place in a concentrated solution, and that consequently salt would not be likely to fix ammonia in a manure heap.—Mr. Elliott replied that the action took place in a strong solution, but it was out of the power of any chemist to ascertain whether it had taken place in a weak solution or not. Mr. Elliott considered that the chief merit of salt as a manure, consisted in affording a supply of soda to plants rather than in fixing ammonia. He considered that plants had the power of decomposing common salt and obtaining the soda, but this was merely a supposition which he intended to bring to the test of experiment.—Surprise was expressed at the statement of Mr. Matthews that he had used salt at the rate of 30 cwt. per acre. It was considered that such a quantity would generally prove highly injurious, and that 5 to 6 cwt. per acre was the utmost that should be used.

Blofield and Walsham.—At the last meeting of this club, the Secretary recounted their proceedings during the past year. Among the subjects which had been discussed was, that of Solid and Liquid Animal Manures. The opinion of the meeting was, that the drainings of farmyards, or other liquid manures, are most effectively secured and best applied when taken up by refuse soil or other compost. At the meeting in June, the subject of Carbon in Cretaceous Soils, Vegetables, and Animals, was introduced by the Rev. Edwin Sidney, in a very instructive lecture.

Orkney.—We have had the pleasure of receiving the Annual Report of the Orkney Agricultural Society. We are glad to see that the spirit of improvement, now active on British Agriculture generally, is being excited and preserved in this far northern district, by the annual award of premiums, "for the improvement of the different kinds of stock, the extension of green crop husbandry, the draining of land, and the encouragement and advancement of other Agricultural objects."

Reviews.

Report on the proposed Pauper Lunatic Asylum for the County of Derby. W. W. Pike, Corn-market, Derby.

We spoke last week of Dr. Daubeny's system of scientific book-keeping, as applicable to the balancing of accounts between what is brought on the farm and what is sold off it, so that its fertility may remain unimpaired. Any one who wishes to see an instance of a calculation upon this principle will find one executed with skill, by Mr. Heywood, in his Report, which is appended to this pamphlet, on the best plan for establishing and conducting a Farm, in connexion with the proposed lunatic asylum at Derby.

Miscellaneous.

Guano.—The word guano was an old term, and one which had been imported into this country from South America. It was now, and had been long, given by the Peruvians to the dung of sea-fowl, which, from the remotest era, had been gathered on certain islands on their coast, and was still represented by the deposits collected on the rocky promontories of South America. They were all aware that many of the islands upon the Scottish coasts were frequented by innumerable clusters of sea-fowl; but their droppings did not remain there. The frequent rains which fell in our variable climate was the obstacle to the accumulation of this kind of manure, for by this means the valuable particles were soon washed away and disappeared. But for 500 or 600 miles on the coast of Peru and Bolivia scarcely any rain fell, and the droppings of millions on millions of these sea-fowls had been allowed to accumulate there in deposits of 60, 70, and 80 feet deep, wherever the birds had permanently settled. The value of this substance was well understood by the ancient Peruvians, and so highly was it estimated, that the various islands along the coast, such as Chincha and others, were each allocated to a separate tract of country, the inhabitants of which drew the guano to grow their crops from a certain island, and no district of country was allowed to obtain the manure from any part but that specially allotted to it. Persons were regularly appointed to look after the birds, and it was an offence punished with loss of life for any person to kill one of them—so satisfied were the Peruvian rulers of the necessity and importance of preserving and husbanding this means of raising their corn. At the present day, this substance was not only extensively employed upon the coast, but it was carried on the backs of mules to vast distances along the ridge of the Cordilleras, for the purpose of fertilising the inland soils. Though the guano might well be supposed to exist on our own coast, it was not found there, from reasons which he had already mentioned. Still, a reasonable hope was entertained that it might be found on other coasts, which were similar to Peru, viz., where no rain fell; but it was not until less than two years ago that deposits had been found in other parts of the world—deposits from the effects of which he augured the most beneficial effects to the Agriculture of this country. It was of great consequence that guano should be found in large quantities on the coast of Africa, for the voyage to it was comparatively short, and they might thus entertain the expectation that in the course of a year or two the price would be reasonably reduced, and thus a greater extent of soil brought under its beneficial operation. After this explanation, he would proceed to inquire into what formed the component parts of guano, and as the quality of different kinds varied, he would show to them the result of the analysis of several samples. The first two columns on the subjoined Table contained the result of two different samples brought from Africa by the Levenside. The next two columns contained samples which had been sent to him from the Star of the West, which had come into Plymouth—the one sample being taken from the hold of the ship, and the other from a quantity which had been brought in bags. The next sample was the guano which had been imported into Glasgow from Ichaboe by Mr. Downie; and the last was a sample from Bolivia, which, in many respects, it would be seen, differed from the others. The Table to which he called their attention was as follows:—

	Levenside.		Star of the West.		Ichaboe.	Bolivian.
Water	15.75	22.85	13.30	27.66	17.41	8.34
Organic Matter and Ammoniacal Salts.	58.09	52.66	32.31	32.34	55.33	65.60
Sulphate of Soda and Common Salt.	—	—	33.50	9.80	—	—
	6.94	6.51	—	—	4.92	0.78
	—	—	1.58	2.02	—	—
Carbonate of Lime and Magnesia	3.32	2.77	5.81	4.12	3.54	1.12
Earthy Matter	2.83	3.11	1.30	3.88	0.57	4.46
Phosphate of Lime	15.07	12.10	12.00	20.18	18.23	19.80
	100	100	100	100	100	100

Now, did these substances contain all that was necessary for a perfect manure? They had, in the first place, organic matter and ammoniacal salts, capable of imparting the great essential of nitrogen to the plant. It generally bore a large proportion in the manure. Then they had sulphate of soda and common salt, which was also highly necessary to the healthy growth of a crop. Then they had carbonate of lime and magnesia, on the merits and importance of which he need not enlarge. Next, they had earthy matter, which should have been placed last on the list, for the less sand they had in their guano the better—the more valuable it would be. They had also the phosphate of lime, so necessary for the inorganic structure of plants. They all contained water to a greater or less extent; but here, also, the less the better, for in proportion to the quantity contained, one kind of guano might be 10*s.* per ton superior to another. In the samples before them they would see how much the quantities varied. Even the two different samples of the Levenside varied from each other by 13 to 22—the one sample in this respect being 9 per cent. better than the other. In the Star of the West it varied from 13 to 27—the one sample being 14 per cent. better than the other. In the Ichaboe sample there was 17 per cent., and in the Bolivian only 8. The latter, therefore, so far as the absence of water was concerned, was decidedly the most valuable. He had, however, never seen more than one sample of this valuable manure, and understood that no more was to be had. That which contained the greatest quantity of water was the least valuable, and the value of that which had the largest amount of ammonia was, on the other hand, proportionably increased. That substance, viz., ammonia, would cost the farmer more to buy than any other of the ingredients; it was therefore the most valuable, because to produce it artificially it would be the most costly. The quantity of this valuable substance in the samples of the Levenside varied from 52 to 58 per cent.; in the Star of the West it was 32 per cent.; in the Ichaboe 55; and in the Bolivian 65—showing, therefore, that the quantity in the latter was double the amount of the Star of the West. They would say, therefore, in this point of view, that the Bolivian was the best, and the Levenside the next best. Before coming to this conclusion, however, let them look to the sulphate of soda and common salt contained in each. This was a cheap article, and got in Glasgow, he believed, for 4*l.* a ton—a price much below what they were required to pay for the guano. The proportion in the Levenside was 6 per cent.; in the Star of the West so much as 33 per cent., and in the Ichaboe it was less than 5 per cent. It was still less in the Bolivian, and, always remembering that this was a cheap article, they came to the conclusion that the Bolivian was the best, and the Ichaboe the next best. The small quantity of earthy matter in the Ichaboe, compared with others, also greatly enhanced its value. They came next to the phosphate of lime, which was necessary to make any manure valuable, and might be held as next

of importance to the ammonia. For the proportions in the different samples he referred to the Table. They would see therefore that guano contained almost all that was essential to constitute a perfect manure. The lecturer then alluded briefly to the importance of thus having concentrated in one manure so many substances which the soil was likely to need, and be benefited by. He would now briefly point out the analogy which existed in the connexion between bones and guano. Some might ask, would guano benefit the after crops? This had been done by bones. Then, if bones had improved the after crops, guano should do the same thing; for phosphate of lime constituted a large portion of the one, and it was a valuable ingredient in the other. They had also salts and soda in each. They had the cartilage in bones which produced the nitrogen, and this was represented by the ammonia of the guano. There was this difference in favour of the guano, that when it was applied to the soil the ammonia was ready made, and immediately exerted a beneficial influence on the roots of the plant; but in the case of bones they had to decompose before the ammonia was set free for the uses of vegetation. The manures, therefore, might often be mixed with benefit—the guano for the purpose of acting immediately, and the bones for exerting their influence after it. He would briefly allude to one most important quality which it possessed, viz., its extreme portability. It appeared that from 4 to 6 cwt. per acre might be safely put in if guano was used alone, and this in fertilising powers would be equivalent to 40 or 50 loads of farm-yard dung. Suppose, therefore, that there was a tract of country, which it was impossible to traverse but by means of mules, they would be enabled to fertilise it by guano, when it was impossible to approach it with such a bulky article as farm-yard manure. They had already seen this exemplified in the case of bones to a considerable extent in this country. They had brought a large tract of land into cultivation in the wolds of Yorkshire and of Lincolnshire, where the bones were carried to the tops of the hills, and clothed them with vegetation. But guano was still more easily carried inland than bones, and when once obtained it was a much more perfect manure. It would have another effect. It would enable the farmer to apply large portions of his farm-yard manure to spots which were easily accessible, and be the means of reducing the price of every other kind of manure, in the same way as had already been done with rape-dust, bones, &c. In fact, the introduction of guano was creating quite a sensation in large towns, such as Edinburgh and Glasgow, from the vast reduction which it would effect in the price of the street manure, and the falling off in which would render the imposition of an additional assessment necessary. In Edinburgh in the course of the present year the assessment was expected to be 1700*l.* more than last year, solely on account of the difference in price of the street-dung. He would conclude with one important point,—Was it proper to use guano alone? Would it be good husbandry? He did not think so; and though he had not time to enter into all the reasons for this opinion, he might state that guano did not supply all the substances of farm-yard matter any more than bones did. It would not, therefore, be safe to recommend farmers to use it alone. This year they might get a good crop by its means alone; but if continued alone, it would tell by and by, particularly on the soils which were poor in what was termed vegetable matter. Therefore, he would consider it the best husbandry to recommend a course similar to that which had been generally employed in the using of bones. This had been to raise one crop by means of bones, and the next by means of farm-yard manure, or to use them half and half. He would think it safer, therefore, to recommend that guano should be used half-and-half with farm-yard manure, or that they should be used alternately. —*Professor Johnston, in a Lecture at Glasgow.*—[*Abridged from the Scottish Guardian.*]

Notices to Correspondents.

Burnt Clay.—*H. P. T.*—Application has been made to the Society for the communication to which you refer.

Barley Sowing.—*Querist.*—It is not necessary to reduce the land to a very fine tilth. If the ground is hard you may harrow both before and after sowing Clover-seed among Wheat; if it is soft, once harrowing after sowing, followed by the roller, will suffice.

Couch, &c.—*A. O.*—Try if alternate layers of quicklime and couch will rot together. Cover the heap over with vegetable-mould.

Dairy Management.—*A. B.* asks any of our readers if they have had any experience of the utility of the new curd-mills, as to whether they get rid of the whey as thoroughly as the old plan of squeezing by hand? also whether there has been time to prove if Mackintosh's rick-cloths, as advertised, are superior, as well as cheaper than Richardson's or Edgington's, and which of these it would be right for him to purchase, his climate being wet?

Draining, &c.—*T. T. H.*—From the appearance of your specimen, we suppose your soil to be adhesive; if it is so in great degree your drains should be at most one perch, *i. e.*, 16½ feet apart; but it is impossible to advise in this matter merely from the inspection of a specimen of the soil. If your land is a loamy clay, not very stiff, 24 feet may be near enough, but we have, within the last five years, put in, on one farm, about 100 miles of drains, none of them in *very* stiff land, and they are all only one perch apart. Mind and subsoil-plough your land when it is dry, or you will do it no good. The stone will do very well to fill in the drains; and if the quarry is close by you, stone will be much cheaper than tile drainage. The price of tiles varies much in different parts of the kingdom. Apply to the nearest factories for information on this subject, and compare it with information you may obtain on application to Mr. Sealey, Bridgewater, Messrs. Etheridge, Southampton, &c. The two ploughs, in preparing land for Mangold Wurzel, merely rib the land—they do not plough it. Was not this sufficiently explained in our article on the subject? We then spoke from experience. We shall be glad to purchase your vol. for 1842; please to state its price.

Food of Plants.—*J. W. Lloyd.*—Perhaps Dr. Smith's articles in our last Paper may assist you. We do not understand your question.

Gorse.—*Tonsor* wishes to know whether "F. Davies" attributes the growth of horses' beards and moustaches to the juice, or to the prickles of the Gorse; for he thinks it probable that, unless it was well bruised, it acted more on the principle of a penetrating hair-brush than on that of Macassar Oil.

Guano.—*Dianthus.*—See this week's Home Correspondence. Sow, in the manner you propose, after the rate of 3 cwt. per acre of the insoluble matter of the guano.——*S. F. W.*—Though, for obvious reasons, we cannot undertake to analyse your specimen, yet from its weight, earthy appearance, &c., we should judge it to be much adulterated.

Horse-dung.—*Subscriber.*—You will preserve it better by mixing it with vegetable mould, and covering with the same, than with oak sawdust; if the latter is used you will succeed better with that which is rotten than with that which is fresh.

Lime-water.—Z.—Cold water will dissolve more lime than hot water; yet 70 gallons of cold water will only dissolve 1 lb. of caustic lime. You had better put a good many pounds into your hogshead, stir about for some minutes, wait till it settles, and then pour the clear lime-water off. Horse-dung is generally a more powerful manure than that of cows, because horses get better food. Apply it in the solid state, or mixed with earth. If you particularly wish to try a decoction of it, put a bushel of either into a hogshead of water for that purpose.

Liquid Manure.—Z.—Put one pound of the superphosphate of lime into a gallon of water, and continue using water till the greater part is dissolved. What remains is gypsum.

Lucerne.—*J. H.*—Please to send a specimen. You had better cut it down as soon as possible for a good seed crop from the second shoot; but you would do better in taking seed from the first shoot.

Manure.—*Meliboeus.*—If your land is not already calcareous, it will pay you to apply lime. After that you may entertain the question—What is the most economical manure? Guano is one of the cheapest and best manures. Lime or guano is not a reasonable alternative. They depend for their efficiency on altogether different circumstances. Your Turnips will need food such as guano would supply them with.

Oilcake.—*Subscriber.*—Crush it into pieces about the size of lump-sugar for cattle, and rather smaller for sheep. Much preparation of food is not required by animals that chew the cud.

Old Mortar.—*Patrick.*—Soot and old lime will not act on each other, but each may be usefully applied. Apply after the rate of 30 bushels of soot per acre, and apply all the old mortar you have on your land, if it be pounded small, up to the rate of 100 bushels per acre. You may mix them or not, just as you please.

Pea.—*S. G.*—We do not know the variety. Its leaf resembles that of a field variety common in some parts of Scotland.

Points of Milch Cow.—*G.* would be greatly obliged to our Guernsey correspondent for information as to where he may meet with a cow for sale, such as he described in this Paper some weeks ago, and as to the probable cost of such a cow. We have made fruitless inquiries after the pamphlet you allude to. What is the name of its author?

Potatoes.—*Delta.*—De Rohan is not the best variety for pigs. The Irish White Apple is better. We *know* of no case in which gypsum has been used as manure for Potatoes. In the instance you refer to, its application appears to have been most beneficial.

Refuse Bark.—*J. L.*—If rotten it is not injurious. We have used, with most beneficial effect, about 10 cart-loads an acre of it, after mixing it with an equal quantity of yard manure, and soaking it with liquid manure.

Stall-feeding.—*W. J. B.*—Your wish shall be attended to.

Steeped Wheat.—*J. R.*—Thank you.

Transplanting Swedes.—*J. L.* would be obliged to our correspondent on this subject in the Paper of March 30th, for information about the application of guano to young Swede plants. We think he had better mix it thoroughly with the soil by cultivation, before planting.

Weeds.—*Alpha.*—Coltsfoot will ultimately disappear if you perseveringly destroy flowers and leaves whenever they appear. The same remedy is effectual, though not so speedily, with the Nettle. You had better use the fork and dig the roots up.——*Querist.*—Your specimen is Luzula campestris. If your land is thoroughly drained, the other Grasses in the pasture should ultimately get the better of it. If they do not, and there is much of it in the Grass, your only remedy is to break it up, fallow, and lay it down again.

Wheat among Vetches.—*M. Sayer.*—We shall insert your notice as soon as there is room. Under the circumstances, you had better use the crop, we think, as one of Vetches, and feed it off; if your advice had been followed early in March you might have had a good crop of Wheat.

Erratum.—In the paper on the Rot in Potatoes (page 234, col. *c.*, line 6 from top), by Mr. Alb. Bernays, Manchester, an error has been printed; it should have been said—"Care should be taken to set only those with healthy eyes, not with sprouts."

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, Monday, April 22.—Per stone of 8lbs.

Best Scots, Herefords, &c.	3s	8	to 4s	0	Best Downs & Half-breds	4s	0 to 4s 4
Best Short Horns	3	4		3 8	do. shorn	3	8 4 0
Second quality Beasts	2	10		3 2	Best Long-wools	3	10 4 2
Calves	4	0		4 10	do. shorn	3	6 3 8
Lambs, small	5	4		6 8	Ewes and second quality	3	4 3 8
— large	5	4		6 0	do. shorn	3	2 3 6
Pigs	3	4		4 0			

Beasts, 2642; Sheep and Lambs, 26,730; Calves, 73; Pigs, 381.

The supply of Beasts to-day is small, but trade is dull, and there is a difficulty in supporting our quotations of last week, although it is done for the very best qualities. Many of the second-class Beasts make fully 2d per 8 lbs less than last Monday. Mutton is a little more plentiful, but the late short markets having produced a clearance of meat in Town, the demand is quite equal to the supply. We notice a decline in price of Sheep in the wool and large fat shorn Sheep, attributable to the warm weather. Selling shorn Sheep remain about the same. Lamb is in demand, at rather lower prices, but no quotable difference: we notice a deficiency of good quality. Veal and Pork remain steady.

Friday, April 26.

The trade to-day was rather lower than Monday, in consequence of the supply being large, and there being many Beasts from Scotland in the market—the best Scots realising from 3s 6d to 3s 10d, and best Downs from 3s 10d to 4s per 8 lbs; and it is difficult to support our Monday's quotations for all other description of stock.

Beasts, 620; Sheep and Lambs, 8940; Calves, 183; Pigs, 376.

41, West Smithfield.

POTATOES.—Southwark Waterside, April 22.

The supply during the past week and those left of former arrivals were more than sufficient for the demand. Several cargoes have been stored: some inferior samples not saleable in the present market, and the holders of others wanted higher prices. There continues to be a quantity of Potatoes brought into this market by railways. Our late quotations have caused many small lots to be shipped from districts not usually supplying this market. Some more cargoes have arrived from Holland, Belgium, and Ireland, and are selling from 45s to 50s. The weather has been remarkably fine, and vegetables are abundant and unusually cheap.

York Reds	80s	to	90s		Essex and Sussex Blues	—s	to 65s
Perth	65		75		Wisbeach Kidneys	—	75

Inferior	60 65	Inferior	86 92	

Joshua Baker, Hay Salesman.

Whitechapel, April 24.

Hay	50s to 60s	Clover	90s to 100s	Straw	26s to 32s
— fine	64 72	— fine	105 110		

Meadow very dull at the above prices.

COVENT GARDEN, April 27.—As the weather has been very fine for some time past, the Market is well supplied with most kinds of Vegetables; but trade is not brisk. Pine Apples are offered at nearly the same prices as mentioned in our last Report. Hothouse Grapes are becoming much more plentiful, and are a little reduced in price; those of the best quality are selling at about 15*s.* per lb. Apples, although not plentiful, are sufficient for the demand, which is not good; they are considerably reduced in price. Pears are scarce. A few green Apricots and Gooseberries have been brought to the Market during the week. Oranges are slightly advanced in price; Lemons are offered at from 6*s.* to 14*s.* per 100. Among Vegetables, Asparagus of good quality is abundant. Young Cabbages have also been pretty plentifully supplied during the week, and a few Cauliflowers have made their appearance in the Market. New Turnips are offered at from 2*s.* to 3*s* per bunch. Broccoli is not altered in price since our last Report. Greens are a little cheaper. No alteration has taken place in the price of Cucumbers; of which a few well-formed fruit are in the Market. French Beans, Rhubarb, and Seakale, are abundant. Carrots and Turnips are sufficient for the demand; Radishes, and other Salading, are plentiful. Among Cut Flowers, we noticed Stephanotis floribundus, Erica aristata, Gnidia pinifolia, Lily of the Valley, Pelargoniums, Cinerarias, Fuchsias, Azaleas, Camellias, China, Provence, and Moss Roses.

FRUITS.

Pine Apple, per lb., 6*s* to 12*s*	Almonds, per peck, 6*s* to 7*s*
Grapes, Portugal, per lb. 2*s* to 4*s*	Sweet Almonds, per lb., 2*s* 6*d* to 3*s*

— per bushel, 1*s* 6*d* to 3*s*	Small Salads, per punnet, 2*d* to 3*d*
— Kidney, p. bush., 2*s* 6*d* to 3*s*	Watercress, per doz. sm. bun., 6*d* to 9*d*
Frame Potatoes, 2*s* to 3*s* per lb.	Parsley, per hf.-sv., 1*s* to 2*s*
New Turnips, 2*s* to 3*s* per bunch	Tarragon, Green, per bun. 3*d* to 4*d*
Turnips, per doz. bunches, 1*s* 6*d* to 2*s*	Endive, per score, 1*s*
Turnip-tops, per bushel, 6*d* to 9*d*	Green Mint, 2*d* to 4*d* per bunch
Red Beet, per doz., 6*d* to 1*s* 6*d*	Marjoram, p. bun. 6*d* to 9*d*
Horse Radish, per bundle, 1*s* to 6*s*	Chervil, per punnet, 2*d* to 3*d*
Radishes, Turnip, 1*s* to 1*s* 6*d* per dozen hands	Salsafy, per bundle, 1*s* to 1*s* 3*d*
Carrots, p. doz. bun., 2*s* 6*d* to 5*s*	Scorzonera, per bundle, 1*s* to 1*s* 3*d*

HOPS, Friday, April 26.

The reports from the Hop-plantations state that in some young gardens the bine is looking well, but that the flea is very numerous and doing much damage in the old grounds. The seed trade being now nearly over, our merchants are making more inquiry for Hops of all descriptions, and the market continues very firm, with a few in offer, at the following quotations.

James Perrin, Wool Broker.

MARK LANE, Friday, April 26.—The arrivals of all kinds of Corn have been small during the week, and the transactions in Wheat, both English and Foreign, on Wednesday and this morning were very limited, but its value remains unaltered.—The quantity of Barley offered for sale being much diminished, and the duty having advanced to 6*s.* per qr., holders have evinced rather more firmness, but we are unable to report any improvement in prices.—Beans and Peas remain as on Monday.—We have little doing in Oats, and their late value is maintained.

Mark Fortescue.

Sales by Auction.

AN EXTENSIVE SALE OF VALUABLE SHORT-HORNED CATTLE, CHEVIOT SHEEP, FARM HORSES, IMPLEMENTS OF HUSBANDRY, &c.

MR. CHRISP will SELL BY AUCTION, at KILHAM, in the parish of Kirknewton, County of Northumberland, on THURSDAY, the 9th day of May, 1844, all the Valuable STOCK on the above Farm belonging to Mr. HUGH BOAG, consisting of about 18 Short-horned Cows and Heifers, Calved and to Calve; 18 Two-years-old Steers and Heifers, fit for grazing; 27 Yearlings, 15 Milk Calves, and 1 Young Bull; 960 Ewes and Gimmers, with their Lambs; 360 Ewe Hogs, 450 Wedder Hogs, 24 Rams, and 30 Ram Hogs, all of the pure Cheviot breed, and 36 Draught and Young Horses.

Mr. CHRISP can with confidence call the attention of the public to this splendid Stock of Cheviot Sheep. For size, constitution, aptitude to fatten, and symmetry of form, they are equalled by few, and surpassed by none in the Kingdom. This affords an opportunity to any one desiring to lay the foundation of a first rate Cheviot or Half-bred Stock rarely occurring. The Short horns are bred from the Stock of Messrs. Hunt, Crofton, Chrisp, Smith, Rennie, &c., and are well worthy the attention of the public. Mr. BOAG has used for the last two seasons Mr. Hunt's celebrated Bull, "Guy Faux," by Gainford, 2044 Coate's Herd-book.

The Farm Horses are nearly all Young, combining strength and Activity with good form, and have been bred with great care and attention by the present owner and his father, the late Mr. JOHN BOAG, of Trewit, for many years. The Implements and Harness, suitable for the improved Northumberland Husbandry, are numerous and good.

As the Sale is extensive, it will commence precisely at Ten o'clock, with the Ewes. Gentlemen from a distance desirous of possessing some of this valuable Stock can have them shipped at Berwick, Leith, Glasgow, Annan, or Newcastle, to all of which ports there is easy and convenient access from Kilham, which is eight miles from Wooler, five from Coldstream, sixteen from Berwick, and twelve from Kelso, through which place coaches from Newcastle and Edinburgh pass daily.

*** The above Stock is offered to the public, without reserve, in consequence of Mr. BOAG leaving his Farm.

The usual discount or credit.

6, Hinde-street, Newcastle, April 26, 1844.

MR. RAINY respectfully begs leave to acquaint the Nobility, Gentry, and the Public, that in order to meet the times, and in consequence of the pressure of mortgages and other incumbrances upon estates, and the various descriptions of real property, brought into the market for sale by public auction and private contract, it is his intention to adopt for the future a REDUCED and GRADUATED SCALE of COMMISSION, as compared with that which has been generally customary for the last half century. At the same time that the expenses of vendors will thus be materially diminished, he trusts that he shall be able to afford greater facilities to the attainment of their objects, and to the fullest advantage; and, touching these points, he feels it necessary to offer a few words of explanation.

There exists between many solicitors and many auctioneers an understanding, to which the epithet collusive would scarcely be too severe, because by it the interest of their clients, the vendors, is often seriously compromised, and in this manner:—The vendor, instead of himself selecting the auctioneer or agent for the disposal of his property, will, in many cases, confide the choice to his solicitor, and not unfrequently the solicitor (but upon what justifiable plea Mr. Rainy never could comprehend) arrogates to himself the right of such choice; and repeated instances might be adduced to show that that choice has been exercised in contravention, if not in opposition, to the previously-expressed wishes of the vendors, and wholly regardless of old and long-established connexions; these solicitors having usually a secret compact with the auctioneer, by which he is bound to fee the solicitor with a share of his commission and other charges, as the *sine qua non* of his being appointed to the sale. And what is the consequence? In such quarters the auctioneer who is willing to concede to the solicitor the largest share, or, in other words, consents to pay the heaviest bribe, be he quack or otherwise, and with slight reference to his regular initiation into his profession, or his qualifications or experience, or (what also is evidently an essential consideration) the extent of his connexions and influence, he is preferred. Thus tempted, many solicitors have become reconciled to abuse the patronage they have assumed, and aim at excluding those auctioneers who, like Mr. Rainy, have consistently and uniformly refused to submit to a tyranny subversive of all proper rivalry, and at variance with all independent and honourable feeling.

With respect, however, to what may be considered the legitimate association of the province of the solicitor with that of the auctioneer or house agent, Mr. Rainy, with the desire to obviate jealousies, to produce a more cordial and satisfactory co-operation between those parties, and in the hope of entirely abolishing secret and derogatory compacts, would suggest that, as a remuneration to the solicitor of the vendor, for his advice and assistance in the drawing and settling of the conditions of sale, and for his attention to those legal points which are in immediate relation with that part of the transaction, a fair portion of the commission should accrue to the solicitor (but with the full knowledge and sanction of the vendor), in lieu of the charges now made by him for the particular items adverted to. This, however, is not intended to include charges for investigations of title, abstracts, deeds, or papers, or fees to counsel; and Mr. Rainy entertains no doubt that the nobility, gentry, and the public will approve of and support the principle of repudiating altogether any clandestine dealings between parties employed in affairs so important to them. But, in all cases where the vendors do not consent to the appropriation to the solicitor of such portion of the commission, or the solicitor, from that integrity, impartiality, and fair sense of justice, and that delicacy and liberal feeling which honourably characterise the conduct of a large number of the members of the legal profession, declines the acceptance of it; then such portion will be remitted by Mr. Rainy to the vendor by whom he is employed.

With regard to sales of pictures, or other works of art, jewels, plate, libraries, and other valuables, a considerable reduction will also be made in the commission, as compared with the printed terms of Messrs. Christie and Manson, Mr. George Robins, and other auctioneers. On this branch, however, no payment is dedicated to any of that numerous class of individuals who perpetually attempt to interfere, as middle-men, and ask to be rewarded for doing nothing; such voluntary interference being wholly useless and absurd, and indeed very often mischievous to the interests of those whom they pretend to serve. The allowance, therefore, which many auctioneers give, and these persons in secret league upon what is termed "the reciprocity system" (meaning, in plain language, on the part of the auctioneer, "procure the sale for me and I will hand over to you a share of the profit"), will be the amount of the reduction in Mr. Rainy's new scale of commission on landed and personal property, solely and exclusively in favour of the vendor; and where the total gross proceeds may exceed £ a still further abatement will apply to the residue.

A similar rule will also govern Mr. Rainy's charges for putting up property to auction, if not sold; for purchases, valuations (including those for probate), references in cases of compensation, or where [illegible] cases; obtaining loans upon mortgage (in conjunction with solicitors), and all other matters incidental to property.

In conclusion, he begs to add that, as heretofore, no sale will be undertaken by him, the genuine character of which will not bear investigation, and every exertion will be made to counteract and defeat combinations and deceptions, whether they are directed against vendors or purchasers.

No. 14, Regent-street, St. James's (in the division between Jermyn and Charles streets.)—April, 1844.

WATERLOO-PLACE, PALL-MALL, commanding the view to St James's Park.—The spacious capital MANSION recently occupied by the CLARENCE CLUB.—By Mr. RAINY, on the premises, on THURSDAY, May 30, at One precisely, unless previously disposed of, and with the option of taking the excellent Household Furniture at a fair valuation,

THE capital, spacious, and elegantly-fitted MANSION, No. 12, on the west side of Waterloo-place, held under the Crown for an unexpired term of 70 years at a small ground-rent. Within the last few years some thousand pounds have been expended in improvements to the premises under the superintendence of an eminent architect, and they are at present in perfect condition, peculiarly adapted for a club, insurance office, or any public establishment requiring a first-rate situation. The ground-floor contains a hall, with handsome principal stone staircase and secondary staircase; one room 42 feet 8 inches by 22 feet 9 inches, and another 27 feet by 24 feet. On the one pair, a drawing-room 31 feet 6 inches by 22 feet 6 inches, and a library 42 feet 8 inches by nearly 16 feet, and an ante-library; a billiard room, three other rooms, and four dressing-rooms on the two pair, and six bed-chambers on the upper floor; complete domestic offices on the basement, including spacious kitchen, larders, &c.

To be viewed till the sale by tickets, which may be had of Mr. RAINY, No. 14, Regent-street; printed particulars may be had of him 14 days preceding the sale; also of Messrs. LANE and PRIDEAUX, Goldsmiths' Hall; at the Auction Mart; and on the premises.

On the same and following days will be sold by auction the plate, linen, books, china and glass, and the valuable cellar of choice wines, further particulars of which will be given in a few days.

PUTNEY-HILL, SURREY.—LIME-GROVE, a spacious Freehold Mansion, let on Lease for a few years unexpired, and the contiguous beautiful Lands, highly eligible for building upon, and containing altogether about 68 Acres.—By Mr. RAINY, at the Gallery, No. 14, on the East Side of Regent-street, St. James's, in the Division between Jermyn and Charles-streets, about the end of May,

THE spacious and capital detached FREEHOLD MANSION, LIME-GROVE, delightfully situate on the rise of Putney-hill, only four miles and a half from the metropolis. It is approached by carriage drives, and contains suites of noble lofty principal apartments, with numerous bed-chambers, offices of every description, coach-houses, stabling, beautiful lawn ornamented with full-grown timber, pleasure-grounds with extensive walks, walled gardens, &c., the whole about 11 acres, on lease for a few years unexpired at 350*l.* per annum; also the contiguous lands extending from the Putney-hill-road into the road leading from Putney to Wandsworth, and other lands called the Nursery, on the west side of the Putney-hill-road, and fronting on the road leading from Putney to Richmond; a timber dwelling-house, formerly in the occupation of Mr. Howey, some cottages, &c., altogether about 56 acres, and highly eligible for building upon, especially the upper ground, from which the finest views are commanded.

The Mansion can only be viewed by special permission of the tenant, and by cards to be had of Mr. RAINY, 14, Regent-street. Printed particulars with lithographed plans will be ready for delivery 14 days preceding the sale, and may then be had of him; also of Messrs. POWELL, F. and W. BRODERIP, and WILDE, Lincoln's-inn; at the Auction Mart; at the Castle, Richmond; Spread Eagle, Wandsworth; and of the person who will attend daily 14 days preceding the sale to show the lands.

HAMPSHIRE.—VALUABLE CHURCH PREFERMENT, about 12 Miles from Winchester, and 17 from Southampton; the Incumbent is in his 73d year.—By Mr. RAINY, at the Gallery, No. 14, on the East Side of Regent-street, St. James's, in the Division between Jermyn and Charles-streets, about the end of May,

THE PERPETUAL ADVOWSON of the PARISH of WARNFORD, in the county of Hants, with the appurtenances thereto belonging. The tithes have been commuted at 620*l.* per annum. There is an elegant modern residence, situate on an eminence commanding beautiful scenery, with 20 acres of glebe pleasure grounds, walled garden, stabling, &c. Warnford is about 17 miles from Southampton, 12 from Winchester, and 60 from London, and the neighbourhood is of the highest respectability.

Printed particulars may be had, 14 days preceding the sale, of Messrs. STONE and TURNER, Jermyn-street; at the Auction Mart; at the Dolphin, Southampton; George, Winchester; and of Mr. RAINY, 14, Regent-street.

BUCKINGHAMSHIRE.—THE GRANGE, a desirable Freehold Residence, with Pleasure grounds and Gardens, and about 30 Acres of Land, situate at Chalfont, St. Peter's, the Property of the late General O'Loghlin.—By Mr. RAINY, at the Gallery, No. 14, on the East Side of Regent-street, St. James's about the end of May, with immediate Possession,

THE GRANGE, an elegant Freehold Residence, situate in a beautiful part of the county of Buckingham, midway between London and Aylesbury, about 7 or 8 miles from the West Drayton and Slough stations on the Great Western Railway, and within 9 miles of Windsor and 5 of Uxbridge. It is seated on the acclivity of a hill in a park-like paddock, ornamented with fine old timber and plantations, approached by carriage drives with neat lodges, contains hall and conservatory, drawing-room 32 feet, billiard-room, library, dining-room, 15 bed-rooms, three dressing-rooms, excellent offices and stabling, walled kitchen-garden, farmyard and buildings, ice-house, gardeners' house, &c.

To be viewed till the sale, and printed particulars may be had 14 days preceding; also of Messrs. DENDY and MORPHETT, Breams-buildings, Chancery-lane; at the Royal Hotel, Slough; the Inns at Aylesbury and Uxbridge; at the Auction Mart; and of Mr. RAINY, 14, Regent-street.

BROMPTON-SQUARE.—Neat LEASEHOLD HOUSE, held for 76 years, at a small Ground-rent—By Mr. RAINY, at the Gallery, No. 14, Regent-street, about the end of May, with immediate possession.

THE neat and substantial LEASEHOLD HOUSE, No. 3, on the west side of Brompton-square, held for 76 years, at a small ground-rent; comprising two rooms on each floor, two kitchens, and other Offices, and a garden.

To be viewed, and printed particulars had, 14 days preceding, on the premises; of Messrs. METHOLD and PYKE, No. 43, Lincoln's-inn-fields; at the Auction Mart; and of Mr. RAINY, No. 14, Regent-street.

GLOUCESTER-PLACE, PORTMAN-SQUARE, West Side.—Eligible RESIDENCE for a Family, with an extra Story of Bed-chambers and Coach-house and Stabling.—By Mr. RAINY, at the Gallery, No. 14, on the East Side of Regent-street, about the end of May, with immediate possession.

THE Excellent LEASEHOLD RESIDENCE, No. 107, on the west side of Gloucester-place, in the first division from Portman-square; held for an unexpired term of about 44 years, at a ground-rent of only 15*l.* 15*s.* per annum. The premises comprise two Rooms on each floor, the drawing-rooms communicating by folding-doors; an extra story of bed-chambers, stone hall and staircase, good offices, and coach-house and four-stall stable.

To be viewed till the sale. Printed particulars may be had, 14 days preceding, on the premises, at the Auction Mart; and of Mr. RAINY, 14, Regent-street.

OPPOSITE the GREEN-PARK.—To be LET, elegantly and completely FURNISHED, for the season, or for one or more years, a superior and spacious MANSION, in perfect condition, having suites of apartments, bed-chambers, and offices, for a family of rank; and at a short distance is excellent stabling.—For particulars and tickets to view apply to Mr. RAINY, 14, Regent-street.

ST. JAMES'S SQUARE.—To be sold by PRIVATE CONTRACT, by Mr. RAINY (with immediate possession), the capital FREEHOLD MANSION of a nobleman. The premises are of modern construction, with spacious lofty principal apartments, hall, and two stone staircases, with offices for a suitable establishment and capital stabling. A smaller Freehold House, which fronts Duke-street, and was formerly part of the original estate, may also be purchased if desired.—For particulars and tickets to view apply to Mr. RAINY, 14, Regent-street, St. James's.

HYDE PARK GARDENS, commanding the entire View over Hyde Park.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY (with immediate possession), one of the best MANSIONS in this much-admired and highly-improving situation. It was finished and completed by the present owner and furnished throughout without regard to expense; and it may safely be affirmed that it is scarcely possible to find a residence of the scale more perfect, both as regards the decorations and the general style and quality of the furniture. The tenure is leasehold for about 90 years at a ground-rent.—To be viewed by a day's previous notice, and by tickets, which with particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

BELGRAVE-SQUARE.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY (with immediate possession), the noble and spacious MANSION the residence for some years of the late Lord Hill. It stands detached, with carriage-drive, and has a large garden at the back, with communication to stabling for eight horses, a loose box, standing for several carriages, with lofts and rooms over. Leasehold under the Marquis of Westminster for an unexpired term of 80 years, at a ground-rent.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

IN a FASHIONABLE SQUARE at the WEST END.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a MANSION of the first class, equal in all its arrangements to the accommodation of a family of the highest distinction; the offices and stabling extensive and complete. The adapted furniture will be included in the purchase.—Principals only can, in the first instance, receive information, and which may be had on application to Mr. RAINY, 14, Regent-street, St. James's.

PORTMAN-SQUARE.—To be LET, FURNISHED, for the Season, a compact, moderate-sized HOUSE, with coach-house and stabling.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

KENT.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, the very valuable and beautiful Freehold Estate, COMBE BANK, the seat of the late Viscount Templemore, situate in the rich vale between Madam's Court Hill and Sevenoaks, 23 miles from London, and a few miles from a railroad station; comprising the finely-timbered park and woods, sheet of water, the noble mansion, stabling, gardens, pleasure-grounds, and walks, the capital farm, with complete agricultural buildings, lodges, &c. The whole about 520 acres, land-tax redeemed. Many thousand pounds have been expended in improvements upon the mansion and property during the last few years, and the whole is in the most perfect condition. Little Combe Bank, a villa, with grounds and some houses in the village, form part of the estate, and will be included in the purchase. Part of the purchase-money may remain on mortgage.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

SUFFOLK, on the Borders of Norfolk, and about 80 miles from London.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a very important and valuable FREEHOLD ESTATE, especially attractive for a sportsman, having been strictly preserved, and affording shooting equal to any domain in the district. It comprehends the entire parish, of nearly 5560 acres, including thriving plantations; also, a capital family mansion, with offices of every description, gardens, pleasure-grounds, &c.; farm-houses and buildings, cottages, &c. The estate is situated in one of the best neighbourhoods in the kingdom, and it is expected that a railroad station will be fixed within a few miles.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

NORTH WALES.—To be SOLD, by PRIVATE CONTRACT, by Mr. RAINY, a highly improvable FREEHOLD ESTATE, land-tax redeemed, situate in a fine part of the country, and commencing within a mile of a capital market town. It comprises 2260 acres, with excellent farm-houses and buildings, all well tenanted; a moderate residence and offices (requiring repairs), a fine lake stored with fish, very thriving woods and plantations, &c., forming a fine and very eligible property for investment.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

NEAR SOUTHAMPTON.—To be SOLD, by PRIVATE CONTRACT, by Mr. RAINY, with immediate possession, a singularly beautiful MARINE MANSION, upon which the present owner has expended many thousand pounds. It is delightfully situate about four miles and a half from the Southampton, Botley, and Fareham stations, and stands in a park-like paddock of 35 acres, well timbered, with superior gardens and grounds, stabling, lodge, &c., and commands very fine sea and inland views.—Particulars may be had of Mr RAINY, 14, Regent-street, St. James's.

KENT.—Six miles from Canterbury, and near to the Sea.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a valuable FREEHOLD ESTATE, partly exonerated from land-tax; comprising a park of beautifully undulated surface, a moderate sized family residence, and offices, and also three farms; the whole about 640 acres, and may be treated for together or separately.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

NEAR RUISLIP, Middlesex, on the borders of Hertfordshire, and about fourteen miles from London.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate Possession, the delightful RESIDENCE of the late General Sir Joseph Fuller, G.C.B., with offices, stabling, gardens, pleasure grounds, and park-like paddocks; altogether about sixty acres, with ornamental water and fine grown timber. The elegant furniture may be had or not, at the option of the purchaser.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

BROWNSEA CASTLE and ISLAND, near Poole, Dorsetshire.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate Possession, the much admired and beautiful FREEHOLD ESTATE, the Island of Brownsea, about a mile and a half in length, and three-quarters of a mile in breadth, at the entrance of the harbour of Poole, a few hours' sail from the Isle of Wight, and within a few miles of the new and much frequented bathing-place, Bournemouth. The castle is spacious and furnished, has excellent gardens, hot-house, conservatory, &c. The island affords wild fowl shooting in the greatest profusion. The situation is peculiarly desirable for yachting, and the scenery is of a picturesque character. The castle would be let furnished, for three years.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

Sales by Auction.

HAMPSHIRE, between Fareham and Gosport, and within a mile and a half of the Railway Station.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate Possession, a very delightful modern FREEHOLD VILLA, with park-like grounds, garden, pleasure-ground, lodges, &c., and the surrounding lands of about 100 acres, part extending to a river, and offering every inducement to any gentleman partial to yachting.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

HAYES COMMON, two miles from Bromley, in the county of Kent, and twelve from London.—To be LET on LEASE, the very desirable RESIDENCE, for many years the favourite retreat of the late Sir Vicary and Lady Gibbs. It stands on a beautiful lawn, with pleasure-grounds, gardens, and paddocks (about 15 acres), and contains accommodation for a family of high respectability, with stabling, entrance lodge, &c. — For particulars and tickets to view apply to Mr. RAINY, 14, Regent-street, St. James's.

MIDDLESEX, ten miles from Town.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a capital FARM, part freehold and part copyhold, containing about 217 acres of rich land, with an excellent house and buildings, on lease to a most respectable tenant, till Michaelmas, 1847.—Particulars may be had of Mr. RAINY, 14, Regent-st., St. James's.

BUCKINGHAMSHIRE.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate Possession, a FREEHOLD ESTATE of about 90 acres of Grass and Arable Land, with agricultural buildings, and an unfinished House, situate at Farnham Royal, two miles and a half from the Slough Station of the Great Western Railway.—Particulars may be had of Mr. RAINY, 14, Regent-st., St. James's.

BATTERSEA, Surrey.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, with immediate Possession, a capital spacious FREEHOLD RESIDENCE, on the banks of the Thames, with terrace-walk, pleasure-grounds, kitchen-garden, paddock, coach-houses, stabling, &c. Also, some other Freehold Property for investment.—Particulars may be had of Mr. RAINY, 14, Regent st., St. James's.

CLOSE to SOUTHAMPTON.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, either together or separate, and with immediate Possession, TWO capital detached RESIDENCES, with such portion of park-like land as may be agreed upon, and either with or without a superior Farm, with excellent farm-house and buildings. The whole estate is Freehold, and comprises 175 acres; and from its immediate contiguity to the improving town of Southampton, presents a most favourable opportunity for a successful building speculation.—Particulars may be had of Mr. RAINY, 14, Regent-st., St. James's.

HANTS.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a capital and spacious FREEHOLD MANSION, standing in a beautiful park of 150 acres, with pleasure-grounds and wilderness, carriage-drives, with lodges, capital walled-garden, hothouses, farm-buildings, &c. &c. The mansion is adapted to the accommodation of a family of distinction, is situated in the midst of the rich and admired scenery of the New Forest, its celebrated field-sports and extensive drives, only nine miles from Southampton, and accessible from the Metropolis in about four hours.—To be viewed with tickets, which, with particulars, may be had of Mr. RAINY, 14, Regent-st, St. James's.

ENFIELD, MIDDLESEX.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, CHASE LODGE, a substantial and handsome Freehold Villa, with pleasure-grounds, gardens, and paddocks (the latter part leasehold), about 27 acres.—Particulars may be had of Mr. RAINY, 14, Regent-street, St. James's.

GROSVENOR-PLACE, HYDE PARK, in front of the Gardens of Buckingham Palace.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a noble and very spacious MANSION, held for a long term, at a low ground-rent, and adapted in all respects to a family of distinction, with attached and detached offices, standing for four or five carriages, and stabling for eight horses. The Mansion has an extra story of bed-chambers, a suite of superb drawing-rooms—viz., 27 feet by 20, 22 feet by 19, 25 feet by 19, and 37 feet by 25, all communicating by folding doors; an eating-room, 37 feet by 25, library, ante-room, two stone staircases, stone hall, screened by a porch, &c.; the whole of the household furniture and fixtures will be included in the purchase, and immediate possession may be had.—To be viewed by tickets, which, with particulars, may be had of Mr. RAINY, 14, Regent-street, St. James's.

EAST COWES CASTLE, in the ISLE of WIGHT, to be SOLD by PRIVATE CONTRACT, by Mr. RAINY. —This distinguished FREEHOLD MARINE MANSION, of stone, and in the castellated style of the time of Edward the Sixth, was erected, at unlimited expense, by the late John Nash, Esq. It affords the most ample and elegant accommodation for a family of distinction, and is especially suited to any member of the Royal Yacht Club. The scenery is too well known and appreciated to render eulogium necessary, and it will be admitted that the facility of access from the metropolis (the distance being now accomplished in about four hours) gives to the property a much increased value. The chief apartments are lofty, and expensively finished; they include a dining room, 30 feet by 20; a drawing-room, 28 feet 6 in. by 21 feet 6 in.; and a library, 30 feet by 27; a billiard-room, 30 feet 6 in. by 18 feet 6 in.; and an octagon library, 19 feet by 19; numerous principal and secondary bed-chambers and servants' apartments, offices of every description, splendid conservatories, a picture or statue gallery, 70 feet by 21; gardens of a superior order, with hothouses, &c. The grounds, which are beautifully undulated, contain, with the gardens, paddocks, &c., about 43 acres, embellished with noble timber and plantations of luxuriant growth, and walks of considerable extent are cut through them.—Particulars and tickets to view may be had of Mr. RAINY, 14, Regent-street, St. James's.

TOTTERIDGE, MIDDLESEX, Ten Miles from London.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a very desirable and substantial detached LEASEHOLD FAMILY RESIDENCE, held for an unexpired term of upwards of thirty years, at a very low rent, with offices, coach-houses, and stabling, pleasure-grounds and walks, kitchen and flower-gardens, with fish-pond and park-like meadows, altogether about thirty acres, with three detached cottages, gardener's cottage, and other buildings. The premises are in perfect order, a very considerable sum having been expended upon them, and they are in every respect suited to a family. Or the house and gardens would be let on lease.—For particulars and tickets to view, apply to Mr. RAINY, 14, Regent-street, St. James's.

DURHAM, within one day's ride of London by the Railroads.—To be LET, for three or five years, a spacious FAMILY RESIDENCE, FURNISHED in a superior style, and adapted for a person of fortune, situate in a beautiful part of the country, with good fishing and hunting, and the exclusive right of shooting over about two thousand four hundred acres. The neighbourhood of the best class, and the circumstances altogether peculiarly desirable. Land may be had or not, at the option of the tenant.—Particulars to be had of Mr. RAINY, 14, Regent-street, St. James's.

NEAR WELWYN, Herts.—To be DISPOSED OF, the unexpired LEASE of about four years, at a moderate rent, (with a renewal if desired), of the capital and very desirable Residence, DIGSWELL HOUSE, delightfully situate about a mile and a half from Welwyn, in the vicinity of many mansions of persons of rank, and only four miles from Hatfield, seven from Hertford, and twenty-five from London, and in the neighbourhood of Mr. Brand's fox-hounds. The house is adapted to accommodate a large family, the gardens and pleasure-grounds well laid out, and surrounded by about fifty acres of productive land, the whole about seventy acres, ornamented with fine timber, and in excellent order: or the premises would be let furnished.—To be viewed by tickets, which, with particulars, may be had of Mr. RAINY, 14, Regent-street, St. James's.

ACTON, MIDDLESEX, Five Miles from Hyde Park.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a singularly elegant FREEHOLD RESIDENCE of the best class, approached by a corridor and hall, and containing library opening to a conservatory, drawing-room, dining-room, &c., seven best bed-rooms, ample servants' rooms and offices for a family, coach-houses and stabling, capital kitchen-garden, walled pleasure-ground, and paddock, about 10 acres. The household furniture may be taken at a fair valuation.—To be viewed by tickets, which, with particulars, may be had of Mr. RAINY, 14, Regent-street, St. James's.

RICHMOND, SURREY, commanding Views of the River Thames and the adjacent Scenery.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, the very beautiful Gothic MANSION, on the rise of the Hill, for many years the residence of the late Mrs. Ellerker, but disposed of on behalf of her representatives, a few months since, to the present owner, who has altered and improved the premises, and made additions at a large outlay. It is arranged to afford complete accommodation for a family of the highest respectability. The dining-room is 30 by 20 and 14 feet high, a library, two drawing-rooms with folding-doors, numerous bed-chambers, offices of every description, ice-house, coach-houses, stabling, and cottage, pleasure-grounds beautifully laid out and ornamented with handsome timber and walks, &c. Or the House would be Let furnished by the year or for six months.—To be viewed by tickets, which may be had of Mr. RAINY, 14, Regent-street, St. James's.

STRETTON-STREET, PICCADILLY, overlooking the Gardens of Devonshire House.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, or Let on Lease, a spacious modern RESIDENCE, with hall and two staircases, capital eating-room, library, and other apartments, on the ground-floor; elegant drawing-rooms and a best bed-chamber and dressing-room, on the one pair; numerous other bed-chambers and servants' apartments, and ample offices on the basement. Coach-house and stabling may be rented at a short distance.—To be viewed by tickets, and particulars had of Mr. RAINY, 14, Regent-street, St. James's.

NEAR CHRISTCHURCH, HANTS. — To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a MARINE VILLA, situate midway between Lymington and Christchurch, commanding splendid sea views; and also an adjoining farm of about 108 acres, with farm-house and buildings, the whole freehold.—To be viewed by tickets, and particulars had of Mr. RAINY, 14, Regent Street, St. James's.

HYDE PARK, commanding the entire Park view.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, or Let Furnished for a term, a very elegant FREEHOLD RESIDENCE, in perfect order, suited to a moderate-sized family. The residence has an extra story of bed-chambers, good offices, and stabling.—To be viewed by tickets, and particulars had of Mr. RAINY, 14, Regent Street, St. James's.

RUTLAND GATE, HYDE PARK.—To be SOLD by PRIVATE CONTRACT, by Mr. RAINY, a very desirable new-built and elegantly finished RESIDENCE, together with the nearly new household furniture. It commands an uninterrupted view over Hyde Park, has an extra story of bed-chambers, a coach-house, and stabling; held for a term of about 90 years, at a small ground-rent.—To be viewed by tickets, and particulars had of Mr. RAINY, 14, Regent Street, St. James's.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

BURBIDGE AND HEALY beg respectfully to inform the Horticultural world that they are quite ready to supply their new BOILER, of every size. They have now fixed a sufficient number to warrant them in stating that what they put forth as the qualities of their Boiler and Furnace arrangement may be perfectly relied upon: they have put up one at the Horticultural Gardens, where B. and H. believe it is considered to answer as represented; they have also fixed it in connection with a new description of Iron Tank, which combines the qualities of the round pipe and the open tank, which may be pronounced the perfection of a Heating Apparatus for Horticultural purposes, particularly for Graperies, Epiphyte-houses, Melon-pits, &c., &c. The arrangement is such that any gentleman or gardener may have the whole constructed so as to be put together with the greatest facility by the gardener, first sending a correct plan to 130, Fleet-street. A Prospectus may be had, detailing the prices, &c.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL;

And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.

47, Lime-street, April 25, 1844.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

WIRE-WORK, HOT-WATER APPARATUS, GREEN. HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

PERUVIAN GUANO, of first quality, and in any quantity, direct from the Bonded Stores. Also African Guano and Nitrate of Soda.—Apply to H. ROUNTHWAITE and Co., 6, Cable-street, St. George's Crescent, Liverpool.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7s. per cwt. Phosphate of Potash, 15s. per cwt.
" Soda 12s. "
" Magnesia 9s. "
" Ammonia 1s. per lb.

*** Super-phosphate of Lime in a concentrated form may also be procured of Messrs. WARNER, 28, Cornhill, and other Seedsmen, in 7 lb. packets, price 1s.

MANURES.

BOAST AND Co.'s PATENT INORGANIC MANURES. These strong and productive manures have already proved their superiority over all others yet adopted. It is now thoroughly understood and acknowledged by intelligent agriculturists that each plant requires a distinct manure, and it is upon this perfectly scientific principle that these manures are prepared, being formed so as to supply all the substances taken from the soil by each particular crop. They are immeasurably more efficacious, far more economical than all others, and possess the great advantage of being easily applied to the land.

Prospectuses, with full particulars, may be obtained; or will be forwarded by post on application at the Manufactory, Bow, Middlesex.

*** By the use of these Manures, any land may be rendered fertile. Wheat, &c. may be grown on the same land every year with immense advantage to the farmer, and without injury to the soil; whilst all the other crops are greatly increased.

GUANO, superior to the foreign, at a reduced price.

Manures prepared expressly for Gardeners and Florists.

THE URATE of the LONDON MANURE COMPANY, 5*l*. per Ton. It is with the greatest satisfaction, after three years' experience, the Company are enabled to recommend the above as one of the best manures for Barley, Oats, Spring Wheat, and more especially Turnips. By promoting a rapid growth of the latter it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. The Urate may be sown broadcast, or which is preferable, by the drill, at the rate of one ton to three acres, and it is desirable it should not be placed more than two inches below the surface. As a top-dressing for Wheat the Urate has been used with great advantage. Gardeners and Florists will find it very useful for Dahlias and other roots. Full particulars and Testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate of Ammonia; Gypsum and every other artificial Manure.

EDWARD PURSER, Secretary, 40, New Bridge Street.

TO AGRICULTURISTS.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also, those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for Hire, for Excavations and Wells, Buildings heated by hot water, for Horticulture, and every variety of manufacturing purposes. The trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

DR. HALLETT'S LIQUID FERTILISER.—The beauty of Flowers, with their power of perfecting their Seeds, and the flavour and size of Fruits and Vegetables, must ever depend upon the food supplied to the plants producing them, and these a very extensive series of trials on various soils has shown, may be secured by the use of Dr. HALLETT'S CONCENTRATED LIQUID FERTILISER, which contains all the essential ingredients of the best foreign Guano, with others equally so, but not to be found by Sea Fowl, in the Atlantic Ocean. Sold at Mr. G. HALLETT'S Factory, Broad Wall, Blackfriars; Messrs. WINSTANLEY'S, Chemists, 7, Poultry; Messrs. WARNERS, 25, Cornhill; Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street; and every respectable Chemist's and Seedsman's, with directions, in stone quarts, at 1*s*. 6*d*. each, and in bottles, six times the size, at 7*s*. 6*d*. The quart requires 32 gallons of water to reduce it for use, for watering soils and growing bulbs in.

IMPORTANT TO AGRICULTURISTS AND OTHERS.

ANALYSES OF SOILS, MANURES, &c. are conducted by MR. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, A., Hawley Road, Kentish Town.

N.B. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.

HAYMAKING SEASON.—Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.

Printed by WILLIAM BRADBURY, of Stoke Newington, and FREDERICK MULLEY EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, printers, at their office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the office, No. 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, April 27, 1844.

The Newspaper.

SATURDAY, APRIL 27, 1844.

BOTANICAL & GARDENING WORKS

PRINTED FOR

LONGMAN, BROWN, GREEN, & LONGMANS.

THE THEORY OF HORTICULTURE; or, an Attempt to explain the Principal Operations of Gardening upon Physiological Principles. By JOHN LINDLEY, Ph.D., F.R.S. 8vo. Illustrations on Wood. 12*s.* cloth.

INTRODUCTION TO BOTANY. By Professor J. LINDLEY, Ph.D., F.R.S. Third Edition, with Corrections and considerable Additions. 8vo. Six Plates and numerous Woodcuts, 18*s.*

A NATURAL SYSTEM OF BOTANY; or, a System-atic View of the Organization, Natural Affinities, and Geographical Distribution of the whole Vegetable Kingdom; together with the uses of the most important species in Medicine, the Arts, and Rural or Domestic Economy. By JOHN LINDLEY, Ph.D., F.R.S. Second Edition, with numerous Additions and Corrections, and a complete List of Genera, with their Synonyms. 8vo. 18*s.*

SCHOOL BOTANY; or an Explanation of the Characters and Differences of the principal Natural Classes and Orders of Plants belonging to the Flora of Europe, in the Botanical Classification of DE CANDOLLE. For the use of Students preparing for their matriculation examination in the University of London, and applicable to Botanical Study in general. By JOHN LINDLEY, Ph.D., F.R.S., Fcp. 8vo., with upwards of 160 Woodcuts, 6*s.*

A SYNOPSIS OF THE BRITISH FLORA, arranged according to the Natural Orders. By Professor JOHN LINDLEY, Ph.D., F.R.S., &c. The Third Edition, with numerous Additions, Corrections, and Improvements, 12mo. 10*s.* 6*d.*

GUIDE TO ORCHARD AND KITCHEN GARDEN; Or, an Account of the most valuable Fruits and Vegetables cultivated in Great Britain: with Kalendars of the Work required in the Orchard and Kitchen Garden during every month in the year. By GEORGE LINDLEY, C.M.H.S. Edited by Professor LINDLEY. 8vo. 16*s.*

AN ENCYCLOPÆDIA OF GARDENING; presenting in one systematic view, the History and Present State of Gardening in all Countries, and its Theory and Practice in Great Britain; with the Management of the Kitchen Garden, the Flower Garden, Laying out Grounds, &c. By J. C. LOUDON, F.L.S., &c. New Edition, enlarged and much improved. 8vo. With nearly 1,000 Woodcuts, 2*l.* 10*s.*

AN ENCYCLOPÆDIA OF PLANTS; including all the Plants which are now found in, or have been introduced into Great Britain; giving their Natural History, accompanied by such descriptions, engraved figures, and elementary details, as may enable a beginner, who is a mere English reader, to discover the name of every Plant which he may find in flower, and acquire all information respecting it. New Edition, with a Supplement. By J. C. LOUDON; W. H. BAXTER, Jun.; GEORGE DON, F.L.S.; and J. D. C. SOWERBY, F.L.S. 1 vol. 8vo. with nearly 10,000 woodcuts, 3*l.* 13*s.* 6*d.*

HORTUS BRITANNICUS; a Catalogue of all the Plants indigenous to, or introduced into Britain. Third Edition, with a NEW SUPPLEMENT, prepared, under the direction of J. C. LOUDON, by W. H. BAXTER, and revised by GEORGE DON, F.L.S. 8vo. 31*s.* 6*d.* The First Supplement, separately, 2*s.* 6*d.*, the New Supplement, separately, 8*s.*

THE ROSE AMATEUR'S GUIDE; containing ample Descriptions of all the fine leading varieties of Roses, regularly classed in their respective families; their History, and Mode of Culture. By T. RIVERS, Jun. Third Edition, corrected and improved. Fcp. 8vo. 6*s.*

THE TREE-LIFTER; or, a new Method of Transplanting Trees. By Colonel GEORGE GREENWOOD. 8vo. with illustrative Plate. 7*s.*

A SCRIPTURE HERBAL. With upwards of 120 Wood Engravings. By LADY CALLCOTT. Square crown 8vo. 1*l.* 5*s.*

CONVERSATIONS ON BOTANY. Ninth Edition, improved, fcp. 8vo., with 22 Plates, 7*s.* 6*d.*; with the Plates coloured, 12*s.*

THE PRINCIPLES OF DESCRIPTIVE AND PHYSIOLOGICAL BOTANY. By J. S. HENSLOW, M.A., F.L.S., &c. Fcp. 8vo. with Vignette Title, and nearly 70 Woodcuts, 6*s.*

A PRACTICAL TREATISE ON THE CULTIVATION OF THE GRAPE VINE ON OPEN WALLS. By CLEMENT HOARE. Third Edition, 8vo. 7*s.* 6*d.*

AN INTRODUCTION TO THE STUDY OF BOTANY. By Sir J. E. SMITH, late President of the Linnean Society. Seventh Edition (1833), corrected; in which the object of Smith's "Grammar of Botany" is combined with that of the "Introduction." By Sir WILLIAM JACKSON HOOKER, K.H., LL.D., &c. 8vo. 36 Steel Plates, 16*s.*; with the Plates coloured, 2*l.* 12*s.* 6*d.*

THE ENGLISH FLORA. By Sir JAMES EDWARD SMITH, M.D., F.R.S., late President of the Linnean Society, &c. 6 vols. 8vo. 3*l.* 12*s.*

CONTENTS:

Vols. I. to IV. The FLOWERING PLANTS and the FERNS, 2*l.* 8*s.*

Vol. V. Part 1, 12*s.*—CRYPTOGAMIA; comprising the Mosses, Hepaticæ, Lichens, Characeæ, and Algæ. By Sir W. J. HOOKER.

Vol. V. Part 2, 12*s.*—The FUNGI—completing the work, by Sir J. W. HOOKER, and the Rev. M. J. BERKELEY, F.L.S., &c.

COMPENDIUM OF THE ENGLISH FLORA. By Sir J. E. SMITH. Second Edition, with Additions and Corrections by Sir W. J. HOOKER. 12mo. 7*s.* 6*d.*

THE SAME IN LATIN. Fifth Edition, 12mo. 7*s.* 6*d.*

THE BRITISH FLORA. In Two Vols. Vol. I., comprising Phænogamous or Flowering Plants and the Ferns. By Sir WILLIAM JACKSON HOOKER, K.H., LL.D., F.R.A., and L.S. &c. &c. &c. Fifth Edition, with Additions and Corrections; and 173 Figures illustrative of the Umbelliferous Plants, the Composite Plants, the Grasses, and the Ferns. 8vo. with 12 Plates, 14*s.*; with the Plates coloured, 24*s.*

Vol. II in Two Parts, comprising the Cryptogamia and Fungi, completing the British Flora, and forming Vol. V., Parts 1 and 2, of Smith's English Flora, 24*s.*

THE VEGETABLE CULTIVATOR; containing a plain and accurate Description of all the different Species of Culinary Vegetables, with the most approved Method of Cultivating them by Natural and Artificial Means, and the best Modes of Cooking them; with a Description of the Physical Herbs in General Use. By JOHN ROGERS, Author of "The Fruit Cultivator." Second Edition. Foolscap 8vo. 7*s.*

"'Rogers's Vegetable Cultivator' is a useful book."—*Gardeners' Chronicle.*

LONDON: LONGMAN, BROWN, GREEN, & LONGMANS.

NOW READY, price 1*s.*

PERUVIAN and BOLIVIAN GUANO, with Full PRACTICAL Instructions for its Use, and Testimonials of its Properties and Results.—JAS. RIDGWAY, Piccadilly, and every Country Bookseller. Also,

1. The Fourth Edition, enlarged, of Morton on Soils, price 10*s.*
2. Agricultural Chemistry for the Practical Farmer, by C. Squarey, 5*s.*
3. A New Edition of "Sinclair on Grasses." Coloured plates, price 30*s.*

NOW BEING PUBLISHED.

LARGE, 1*s.* 6*d.*; SMALL, 1*s.*; GARDENERS' EDITION. 6*d.* THE BOTANIC GARDEN; OR, MAGAZINE OF FLOWERING PLANTS.

WITH MANY IMPORTANT AND USEFUL ADDITIONS.

By B. MAUND, F.L.S.

Each Number contains BEAUTIFULLY-COLOURED FIGURES OF ORNAMENTAL PLANTS, both herbaceous and shrubby, suitable for the Flower-Garden or Pleasure-Ground. With the derivations of names, classes, orders, height of the plants, time of flowering, native country, history, qualities, most approved modes of propagation and culture; and other information, interesting to every lover of a Garden. Annexed to each Number is the

FLORAL REGISTER,

With Woodcuts of admired Flowering Plants, mostly such as have been newly imported into this country; with the necessary information respecting them. Also,

THE AUCTARIUM,

in which are given, improved methods of cultivation of vegetables, fruits, and flowers; new discoveries connected with gardening, and the power of new manures; and miscellaneous information. Also, in each Number, till complete, a portion of Prof. Henslow's

BOTANICAL DICTIONARY,

With numerous Explanatory Woodcuts, and Explanations of the English and Latin words in use, written expressly for the Author. Thus the "Botanic Garden" contains Four distinct Works, proceeding together, at a trifling cost, once a month.

PRICES.	LARGE	SMALL

No. XVI. of THE GARDENER'S EDITION, at 6*d.*, with partially-coloured plates, was published on 1st April.

The portions of the FLORAL REGISTER and AUCTARIUM already published contain nearly Twelve Hundred Engravings, forming one handsome volume, which will be delivered GRATIS to the purchasers of four volumes of the BOTANIC GARDEN.

GROOMBRIDGE, Paternoster-row.

Under the Patronage of their Royal Highnesses PRINCE ALBERT and the DUKE of CAMBRIDGE, and a large portion of the Nobility, Gentry, and Agriculturists of the United Kingdom.

Now publishing, price 10*s.*, illustrated by 5 Plans,

THE PRACTICAL DRAINAGE OF LAND OF ALL DESCRIPTIONS.

By HENRY HUTCHINSON, Land Agent, Valuer, and Professor of Draining, Walcot, near Stamford.

London: HOULSTON and STONEMAN, 65, Paternoster-row; HENRY JOHNSON, St. Mary's Hill, Stamford, and may be had of all Booksellers.

Just published, Part the Second, price 10*s.*

SPECIES FILICUM, or a Synopsis of all known FERNS. This Second Part contains POLYPODIACEÆ continued, and Plates XXI. to XL. By Sir WILLIAM JACKSON HOOKER, K.H., L.L.D., F.R.S., &c.

*** It is intended to publish Part the Third in July.

WILLIAM PAMPLIN, 45, Frith-street, Soho-square.

LINDLEY'S ELEMENTS OF BOTANY.

1 vol. 8vo, with many hundred figures on wood, 10*s.* 6*d.*, cloth.

ELEMENTS of BOTANY, STRUCTURAL, PHYSIOLOGICAL, SYSTEMATICAL, and MEDICAL; being a Fourth Edition of the Outline of the First Principles of Botany. By JOHN LINDLEY, Ph. D. Professor of Botany in University College, London.

LIEBIG'S AGRICULTURAL CHEMISTRY. Third Edition. 8vo, 10*s.* 6*d.*

LIEBIG'S ANIMAL CHEMISTRY. Second Edit. 8vo. 9*s.* 6*d.*

LIEBIG'S CHEMICAL LETTERS. Second Edition. Fcap. 8vo. 4*s.* 6*d.*

TURNER'S CHEMISTRY. Seventh Edition. By Professors LIEBIG and GREGORY. 8vo. 1*l.* 8*s.*

Printed for TAYLOR and WALTON, 28, Upper Gower-street.

FLORA ODORATA; a Characteristic Arrangement of the Sweet-scented Flowers and Shrubs cultivated in the Gardens of Great Britain; with Practical Directions for their Selection, Propagation, and General Management. By FREDERICK T. MOTT. Price 3*s.*

"The idea is a happy one, and we have no doubt it will meet with success."—*Gardeners' Chronicle.*

"We venture to predict for this work an extended circulation, and no small share of popular favour; there is a practical character pervading it which, in our opinion, must constitute its passport to general acceptance."—*Nottingham Mercury.*

"This Work has four great merits—utility, brevity, elegance, and cheapness."—*Essex Mercury.*

ORR and Co., and HOULSTON and STONEMAN, Paternoster-row, London; and BROWN and HEWETT, Leicester.

Just Published in demy 8vo, price 10*s.* 6*d.* cloth, with Map.

GEOLOGICAL OBSERVATIONS ON THE VOLCANIC ISLANDS visited during the Voyage of H. M. S. "Beagle," together with some brief notices on the Geology of Australia and the Cape of Good Hope.

By CHARLES DARWIN, Esq., M.A., F.R.S.

London: SMITH, ELDER, and Co., 65, Cornhill.

LOUDON'S AGRICULTURE—A NEW EDITION.

Just published, 5th Edition, with a New Supplement, one very thick vol. 8vo, with nearly 1300 woodcuts, 2*l.* 10*s.*, cloth.

AN ENCYCLOPÆDIA of AGRICULTURE. By J. C. LOUDON, F.L.G.Z. & H.S. &c., Author of the "Encyclopædia of Gardening," &c.—The SUPPLEMENT, bringing down Improvements in the Art of Field-Culture from 1831 to 1843 inclusive, comprising all the previous Supplements, and illustrated with Sixty-five Engravings on Wood, may be had separately, price 5*s.*

By the same Author,

AN ENCYCLOPÆDIA of GARDENING. 50*s.*
HORTUS BRITANNICUS. 31*s.* 6*d.*
AN ENCYCLOPÆDIA of PLANTS. 73*s.* 6*d.*
ENCYCLOPÆDIA of RURAL ARCHITECTURE. 63*s.*
AN ENCYCLOPÆDIA of TREES and SHRUBS. 50*s.*

London: LONGMAN, BROWN, GREEN, and LONGMANS.

THE PEOPLE'S FAMILY BIBLE.—A splendid Super-royal Quarto size—Large Type—Marginal References, &c. Every Part, price One Shilling, containing Two Sheets of the Authorized Version of the Text, printed at the Cambridge University Press, and two highly-finished Steel Engravings, comprising Historical Subjects after the Old Masters, and Landscapes from Drawings on the spot. A Palace Bible, embellished with One Hundred and Eighty Plates, at a Cottage Price.

FISHER, SON, and Co., Newgate-st., and Angel-st., London.

THE LANCET.—No. 6.—New Series.—Greatly Enlarged Form, and price changed from Eightpence to *Sixpence.*—Now publishing, Original Lectures (for THE LANCET), by the celebrated LIEBIG; the Chemistry of Medicine—Physiology—Diet—Successful Agriculture and Manufactures—and the Application of Chemistry to all the purposes of Mankind. Other Lectures, in the same volumes, by the distinguished LISTON, on all the Operations of Surgery; by SCHONLEIN, of Berlin, on Medicine; by BAILLARGER, of Paris, on Insanity. Communications by the first writers and practitioners of the day;—Criticisms by the Editors on passing events;—Reviews; Hospital Reports;—ANALYSES of all the British and Foreign Medical, Chemical, and Physiological Journals;—REPORTS of Discussions in various SCIENTIFIC SOCIETIES;—with a vast number of other matters, forming a Journal of all the News of the World, in relation to the treatment and cure of disease, the prevention of suffering, the preservation of human health, and the creation of a high order of thought in the human mind.

THE LANCET is published every Saturday, unstamped, price *Sixpence.*

THE LANCET is published every Saturday, *stamped*, for *free postage*, at home and to the COLONIES, price *Sevenpence.*

THE LANCET is published MONTHLY, in PARTS, as a MAGAZINE, four Numbers in each part, price *Two Shillings.*

No. 1 of the ENLARGED NEW SERIES, *commencing* with LIEBIG'S Lectures, was published on March 23rd, and No. 6 on April 27th.

PART I. of the MONTHLY PARTS will be published on *Wednesday next*, MAY 1st.

THE LANCET in its greatly enlarged form (enlarged more than one-half), and at its much reduced price (reduced from 8*d.* to 6*d.*), is the largest and cheapest work of the kind in this kingdom, and it commands more than double the sale of any similar periodical published in Europe.

London: JOHN CHURCHILL. Agents: all Booksellers and Newsvenders in Town and Country.

Now publishing,

A TREATISE ON GUANO, the most portable, cheap, and effective Manure in the world; its results, and the manner and seasons in which it is to be applied, at the least expense and the greatest possible advantage, may be had of the Author only, by inclosing 1*s.*; letters, post-paid, addressed to W. A. HARWOOD, 10, Upper Sparling-street, Liverpool, and a copy will be forwarded to any part of the Kingdom.

Also, by the same Author, price 6*d.* (post-paid), a Pamphlet on Horticulture and the Kitchen-Garden; The Importance of Liquid Guano, which to a poor cottager and market-gardener is invaluable as to the saving of labour, expense of manure of extra quality, early and new double crops.

N.B.—Any Agriculturist desirous to have 2 cwt. to 1 ton of Guano, it shall be forwarded per railway to any part of the United Kingdom.

PROVIDENT LIFE OFFICE, 50 REGENT STREET, FEB. 15, 1844.

BONUSES DECLARED, 529,306*l.* 17*s.* 7*d.*

NOTICE is hereby given, that all Persons who hold Policies in this Office, bearing date prior to the year 1834, may receive the present value of the Bonuses which have been added to their Policies, upon application at the Head Office, or to the Agents through whom the Policies were issued.

NATIONAL MERCANTILE LIFE ASSURANCE SOCIETY, ARTHUR-STREET WEST, LONDON BRIDGE. (Established in 1837.)

Directors.

Chairman.—Robert Currey, Esq.

Edward Baker, Esq.	Thomas Bax, Esq.
Jasper Capper, Esq.	Joseph Cooper, Esq.
Thomas Dakeyne, Esq.	Russell Jeffrey, Esq.
Giles Redmayne, Esq.	William R. Spicer, Esq.
James Spicer, Esq.	Joseph Sterry, jun., Esq.
Henry Sterry, Esq.	Robert Wilcoxon, Esq.

Bankers.—Messrs. Prescott, Grote, and Co.

ADVANTAGES.

A BONUS of two-thirds of the Profits allotted to the Assured.

LOWER RATES OF PREMIUM charged for Assurances without profits.

PREMIUMS payable Annually, Half-yearly, or Quarterly.

ASSURANCES OF EVERY DESCRIPTION may be effected. Among others, the important one, *originated by this Society*, of securing a sum to the Assured himself on his attaining any given age, or to his family *in the event of his earlier death.*

A POCKET DIARY containing detailed particulars, may be had on application at the Office, or of the Society's agents.

JENKIN JONES, Actuary and Secretary.

LONDON, EDINBURGH, and DUBLIN LIFE ASSURANCE COMPANY, No. 3, Charlotte-row, Mansion House; and 18, Chancery-lane, London.

This is the only Company who are bound by their deed of constitution not to dispute any Policy, unless they can prove that it was obtained by fraudulent misrepresentation; and nothing but fraud proved to have been committed against them can vitiate a Policy granted by this Company.

This is the only Company from whom the assured on the mutual principle receive the whole of the mutual accumulations, and also a guarantee from the Shareholders for the sums assured.

This is the only Company who bind themselves to pay the sums in the Policies, although the debts for which they were effected shall have been liquidated before the claims arise.

This is almost the only Company who grant in favour of creditors *whole-world Policies*, whereby the debt is secured, although the debtor should go beyond the limits of Europe.

By the half-premium plan only one-half of the premiums for the first seven years is required, the other half being payable at the convenience of the assured; thus allowing a Policy to be continued for seven years at one-half of the usual rate, or to be dropped at one-half of the usual sacrifice.

ALEX. ROBERTSON, Manager.

News of the Week.

THE debate in the French Chambers on the affairs of Tahiti, for which the Opposition had made such formidable preparations, was cut short on Friday by the superior parliamentary tact of M. Guizot. After allowing the Opposition leader on that day to open his plan of attack and divulge his case against the Cabinet, M. Guizot took his opponents by surprise by presenting to the Chambers an additional mass of documents connected with Tahiti, all of which, he said, were necessary to the elucidation of the question. The Opposition of course were unprepared with any other plan and the debate was consequently adjourned to give time for the examination of the new documents. This check is said to have embarrassed the Opposition, and it is generally believed that although they may again incidentally refer to the affairs of Tahiti, they will not attempt to make another systematic attack on ground which has already proved so unpropitious.—From Spain we learn that the Government have begun to

interfere with the constitution of the municipal bodies, and that the councillors of Madrid have been entirely changed at the dictation of the Ministry. Several Carlist movements are mentioned, and much activity has been observed of late among the refugees on the French frontier. The quarrel between Spain and Morocco is not adjusted, and the Emperor, having been informed of the hostile intentions of the Spanish Government, is said to have proclaimed the "holy war" against the infidels.—From Portugal we have further accounts of the insurrection at Almeida, by which it appears that no impression has been made on the citadel by the bombardment, and that orders have been given to storm the place. It is, however, very doubtful whether the Queen's forces are strong enough to carry even so feeble a fortress.—The accounts from Italy mention another insurrectionary outbreak in Calabria; but the precautions taken by Austria, in conjunction with the local governments, are expected to check any general rising for the present.—The news from Turkey is at once startling and characteristic. The Government had issued a summons to its Mussulman subjects, commanding their attendance in their mosques on a stated day, to hear an imperial decree which materially affected their interests. All the troops in the garrison were got under arms, and with their assistance the mosques were surrounded, and some 15,000 men, including the survivors of the famous Janissary corps, were seized under pretence of military service, and transported in steamers and ships of war to the islands in the sea of Marmora. They were then rigidly examined: many of those who were known to be living in service were sent back to their masters, while the rest were ordered to be enlisted in the naval or military services. This extraordinary measure is attributed not to any actual necessity for fresh conscripts, but to a prevailing rumour that a conspiracy was in progress for the purpose of making a general attack upon the Franks, as a retaliation for the late concessions to France and England in regard to renegades.

At home, the business of Parliament has been in a great measure suspended in consequence of a personal quarrel between Mr. Ferrand, Sir J. Graham, and Mr. Hogg,—Mr. Ferrand having brought certain charges against the latter gentlemen which induced them to appeal to the House for its protection. For the details of this affair we must refer our readers to our Report.—The Irish State-trials have now reached another stage; the motion on behalf of the traversers for a new trial, was commenced on Thursday, by Mr. Whiteside, who occupied the entire day with the legal arguments in favour of the motion, and was obliged to defer the conclusion of his address to yesterday. This motion may possibly be terminated about the beginning of next week; but it is generally supposed that the motion in arrest of judgment, which will follow, will occupy much longer time.

Home News.

COURT.—Her Majesty and Prince Albert, the Prince of Wales, and the Princesses, continue at Buckingham Palace, and are in excellent health. The King and Queen of the Belgians are still at the Palace, on a visit to her Majesty. Thursday being the Queen's birthday, her Majesty held a drawing-room, which was very numerously attended. The day was observed with the usual honours at all the public establishments, and in the evening the club-houses and principal shops were illuminated. On Saturday, Prince Albert presided at a meeting of the Fine Arts Commission, and afterwards inspected the New Houses of Parliament. The Duchess of Kent left town on Tuesday for the Continent, accompanied by the Prince of Leiningen. Her Royal Highness proceeds in the first instance to Paris, on a visit to the King and Queen of the French, and intends to return to England about the end of August. —The Marchioness of Douro has succeeded the Countess of Charlemont as the Lady-in-Waiting, the Earl of Hardwicke has succeeded the Earl of Morton as the Lord-in-Waiting, and Captain Meynell has succeeded the Hon. Capt. Duncombe as the Groom-in-Waiting on her Majesty. It is rumoured that Mr. G. E. Anson, Treasurer to Prince Albert, will shortly be appointed Private Secretary to the Queen.

Parliamentary Movements.—Sir W. Follett has been returned for Exeter by a majority of 764. The numbers were, for Sir W. Follett, 1293; for Gen. Briggs, 529.—Mr. Baring has been returned for Huntingdon without opposition, and the Marquess of Blandford has been returned for Woodstock. Mr. Humfrey, who had come forward as a candidate for the latter place, declined going to the poll.—It is said that Capt. Hamilton is likely to resign his seat for Aylesbury, in favour of Mr. Thesiger, the Solicitor-General.

Foreign.

FRANCE.—The debate upon the affairs of Tahiti, which has occupied the attention of the French public for some days, almost to the exclusion of every other topic, came on in the Chamber of Deputies on Friday, and met with a rather ridiculous conclusion. The attack of the Opposition upon the Ministry, notwithstanding its formidable appearance, the care taken in its preparation, the powerful combination of which it was formed, and the experience of its leaders, has been completely defeated by the superior parliamentary tact and skill of M. Guizot. In this, as in some of the previous parliamentary struggles between the Government and the Opposition, M. Guizot preferred defeating the attacks of his adversaries by skilfully parrying their blows, to meeting them with a direct resistance. On Friday, he allowed the Opposition, by their champion, M. Billault, to open their system of attack, and when he had ascertained the whole of the case to be made out against him, he completely turned the tables by presenting to the House a bundle of 30 additional documents on the affairs of Tahiti, all of them, according to him, of the utmost importance to the proper elucidation of the subject. These he strongly recommended to the careful consideration of the Opposition members, and as it was quite impossible that the debate could be brought to a conclusion until the contents of these papers were known, and as it was also evident, from their number, that it was impossible they could be studied at once, he suggested that the debate should be adjourned, so that members might have an opportunity of consulting and considering these interesting documents at their leisure. The Opposition were completely taken by surprise. They seem never to have contemplated the possibility of the Ministry consenting to produce any further information on the subject. They were, therefore, not prepared with any other plan; and as it was self-evident that it was necessary to ascertain of what the documents consisted (a piece of information which they did not receive from M. Guizot), they had nothing to do but to agree to the suggestion thrown out by the Minister, and consent to the adjournment of the debate. In the course of his speech, M. Guizot stated that Admiral Dupetit Thouars had not been formally recalled, that Admiral Hamelin, who had been appointed to replace him at Otaheite, had not sailed in the vessel in which he was to have proceeded to the South Seas, and that this ship, the Ariane, had subsequently been ordered to another destination. The *Journal des Débats* states, that the documents laid before the Chamber, by the Minister, consist of thirty letters exchanged between Queen Pomaré and the French and English authorities at Tahiti, from the 16th December, 1842, to the 8th November, 1843, together with six diplomatic papers and two appendices. As a sequel to the above, it is generally considered in Paris that the Tahiti affair is extinct, and that it is very doubtful if it will be resuscitated. The friends of the Ministry are confident that the Opposition will not attempt again to fight on ground that has been so unpropitious to them as that of Tahiti. Some Opposition members however are anxious to renew the affair next week, and it is said that they have some notion of moving for further papers.—On Thursday the Chamber by a great majority approved and adopted the amendment introduced by the Chamber of Peers into the Bill for amending the Game Laws, which empowers persons authorised by the Crown to hunt, shoot, carry, and sell game, at all seasons of the year. On Saturday a long discussion took place on several petitions presented from the different consistories of the French Protestant Church, praying for the free exercise of their religion. The number of members of the Reformed Church in France is very great; but in some districts, where the congregations are small, they are unable to build churches. In such cases the members of the Reformed Church are deprived of the exercise of public worship altogether; for though the 5th article of the Charter allows liberty of conscience to all classes of Christians, they cannot hold meetings in private houses, because they would then make themselves amenable to the 291st article of the penal code, the object of which is to prevent the meetings of private and unauthorised assemblages of people. The petitioners, therefore, prayed that religious meetings should not be held as falling within the meaning of the 291st article of the penal code. They stated, in support of that prayer, that several of the royal courts, and among others the courts of Rennes and Orleans, had several times decided that religious assemblies did not fall within the meaning of the law. The committee of the Chamber, to which these petitions were referred, reported in favour of the prayer of the petitioners; and their reporter, M. de Haussonville, after a statement of the facts, moved, on the part of the committee, that the petitions be referred to the Minister of Justice and of Public Worship, with a recommendation that he should accede to the prayer of the petitioners, and introduce a measure to declare that the 291st article of the penal code did not apply to religious assemblages. After a smart discussion, M. Dupin moved the order of the day, and after two doubtful divisions, the order of the day was carried (by ballot) by a majority of 107 to 91. —In the Chamber of Peers, on Monday, a discussion commenced upon the Bill relative to secondary instruction introduced by the Ministry, which has so greatly contributed to the feud between the Clergy and University of France. The main feature of the discussion was a speech delivered in defence of the University by M. Cousin, a member of that body and a writer of some note, and at its conclusion the debate was adjourned. In the Deputies, on the same day, a Bill came under consideration, the main object of which is to subject incarcerated offenders of every description to solitary confinement. Against the Bill MM. Cordier and De Sade spoke, and MM. Corne and Taillandier expressed themselves in favour of it; all these four Deputies voting on most political questions with the Opposition. The debate was distinguished for much practical knowledge and an absence of party feeling.—The committees on the different Railway Bills meet daily. On Saturday the committee on the Montpellier and Nismes Railway Bill made its report to the House. The committee reports strongly in favour of the Bill. The committee has determined to leave this line to private enterprise.—The rumoured disaffection in the army continues to give rise to great anxiety, and the existence of secret societies in the army is now made manifest by the arrest of numerous sub-officers and soldiers of at least three regiments. One of these regiments was lately in garrison in Paris; the other two, a regiment of artillery and a regiment of the line, were in the south of France. The fact that the regiment in which disaffection was discovered in Paris had just arrived from the place in which the other two had also been quartered (Toulouse), suggests the belief that the focus of the conspiracy, if the matter deserves that name, is in that city. The first had arrived in Paris from Besançon, coming from Toulouse. The artillery regiment is in Besançon, having lately arrived there from Toulouse. The third, the infantry regiment, has been on its way since the 19th inst. from Toulouse, for Perpignan, for embarkation to Africa. The evil and its seat being known little danger of its spreading exists; but still the fact that the disaffected find means to act upon the army is a serious one.—Advices from Algiers of the 14th announce the reappearance of Ab-el-Kader and his adherents in distant parts of the French possessions. The resurrection of the oft-destroyed Emir elicits from the Governor-General, Marshal Bugeaud, a proclamation, in which he tells various Arab tribes that he is about to take the field, and that if they do not previously tender their submission "he will enter their mountains, burn their villages and crops, and cut down their fruit-trees."

SPAIN.—We have accounts from Madrid to the 15th. The municipality of the capital has been almost entirely changed. Some months since eleven members of that body tendered their resignation, which was not accepted at the time; but within the last few days eleven new councillors have been appointed, all of them upon the nomination of the Government. The *alcalde* has been suspended, on account, it is said, of an altercation with his colleagues, but more probably for some offence given to the Government. Accounts from the frontiers state that the Carlist General, Forcardell, who during the civil war was one of Cabrera's principal officers, was arrested on the 13th inst., at Amelie-les-Bains, where he had gone with the intention of making his way into the north of Spain. The same letter states that a Carlist band appeared on the 11th in the neighbourhood of Ripoli, upon which the tocsin was sounded, and the national militia called to arms. The result of a fight which ensued was that the chief of the band, called Francisco Oliveras, was arrested, and carried to Girona. Another band, composed of brigands, is congregated in the neighbourhood of Vich, where they have succeeded in arresting several of the richest persons in the country, and exacting large ransoms. The papers also state that several Carlist refugees, who furtively quitted the residences assigned to them in France, have been arrested at Bayonne by the authorities, and forced to return to the depots in the interior of the country. The Queen, the Queen mother, and the Infanta, are to go in the course of the summer to visit the provinces and to take the mineral baths of Catalonia. M. Gonzales Bravo and some of his colleagues are to accompany the royal party. The journals dwell on the expedition projected against Morocco, and represent the quarrel to be daily assuming more gravity, owing to the unsatisfactory reply returned by the Government of that country to the remonstrance of the Consuls residing at Tanjiers, and of the Spanish and Sardinian Chargés d'Affaires. According to a letter from Gibraltar of the 10th inst., the Emperor of Morocco, on being informed of the hostile intentions of Spain, had proclaimed the "holy war" against infidels, and called out 40,000 horsemen, to whom he had assigned a rendezvous at a point within a short distance of the coast.

PORTUGAL.—Our accounts from Portugal are to the 17th inst. Almeida continues in the possession of Count Bomfim, and no serious impression evidently has been made on it by bombardment, as orders appear to have been issued to proceed immediately to the storming of the place. The result of any attempt by assault is very doubtful, as the Portuguese, like the Turks, though not deficient in bravery, are proverbially noted for their efficiency behind stone walls. The forces under the Queen's Generals are not much more than three times the number of those at Count Bomfim's disposal. A number of persons have been arrested in the vicinity of Lisbon, in the act of leaving the city with a view of proceeding to Santarem to get up a pronunciamento. At Lamego disturbances are said to have taken place, and a guerilla has been established there.

GERMANY.—A letter from Leipsic states that the only Protestant Minister in the Bavarian Cabinet has just given in his resignation in consequence of the religious difference revived between Prussia and Bavaria on the subject of the Protestant union of Gustavus Adolphus, of which the King of Prussia has declared himself the protector, an announcement which has offended the numerous Catholic inhabitants of Prussia. The Empress of Russia is expected at Berlin at the end of June. She will remain some time at Sans Souci, and afterwards at the Château of Fischbach, in Silesia. Nothing is yet known of the period of the Emperor's journey.—Letters from Tripoli in Galicia state that a child belonging to a Christian family having disappeared, the people believed that it had been stolen by the Jews, and made a sacrifice at their Feast of the Passover. Violent attacks were made upon the Israelites, but it was shortly after made known that the child, having received correction from its parents, had run away and taken refuge in a neighbouring village, where it was found alive and well.—In a letter of the 14th instant, from Trieste, it is stated, on the authority of accounts from Goritz, that there is an improvement in the health of the Duke d'Angoulême. The Prince having

passed the usual period without experiencing an attack, his physicians have expressed hopes of his recovery.

ITALY.—Accounts from Marseilles dated the 18th inst. state as positive that an insurrectionary movement had taken place in Sicily, and that disorders had occurred at Reggio, in Calabria, which are attributed entirely to the distress of the people, who are in a wretched state for want of corn. The Queen of Naples was safely delivered of a Princess on the 14th. Prince Schwartzenburg, the Austrian Minister, arrived at Naples on the 5th, and was said to be the bearer of instructions to the Neapolitan Court, not only with respect to the affairs of Italy, but also those of Spain.—The eldest daughter of the Grand Duke of Tuscany was married to Prince Leopold of Bavaria on the 15th. Count Fossombroni, for many years Minister of State in Tuscany, and a man of great learning, died at Florence on the 13th, at the age of 89 years.—The last accounts from Rome announce that the senior Member of the Holy Conclave, Cardinal Pacca, had received the last sacraments, and was not expected to survive many days. The Cardinal was born on the 25th Dec., 1756, and consecrated in 1801 by Pius VII. The emigration from the south towards England has commenced, the incredible number of 4000 English passports having been signed at Rome in three days subsequent to the termination of the holy week.

TURKEY.—On the 28th ult., the Porte put in execution one of those sudden and arbitrary measures not unfrequent in the East, but which in European countries would probably endanger the very existence of the Government. When the post left on the afternoon of the 27th, nothing was known of the steps which were to be taken on the following day. Towards the evening public criers went through the streets of Constantinople and its suburbs, ordering all Mussulmans to repair early next morning to the mosques, where an imperial hatti sheriff was to be read, the purport of which affected materially the inhabitants of the capital, and at the same time advising the Christians to keep within their doors till the afternoon. These forewarnings caused a general alarm, both amongst the Rayahs and the Frank population. They were supposed to be connected with the important question which had lately agitated the Porte, and the solution of which had created general ill-feeling against Christians. A profound secresy was maintained as to the intentions of the Government. On the morning of the 28th the Mussulmans collected each in the mosque of his quarter. Cavasses and soldiers paraded the streets, and compelled all those who lingered in them to accompany the crowd into the places of worship. When they had all been collected the doors of the mosques were closed. At the same time extraordinary measures were taken to prevent any resistance or disturbance. All the troops in the capital were under arms, and several vessels of war ready for service were stationed in the Golden Horn. An extraordinary number of cavasses and guards now entered the mosques and seized upon all the young, well-made, and unmarried men who are only resident in Constantinople. They bound them two and two, and conducted them on board steamers ready to receive them, in which they were conveyed to Halki, one of the Prince's Islands, which is uninhabited, and there landed. In this manner, according to the lowest account, 15,000, and according to general report, 30,000, were arrested. On the following day a number of officers visited the island for the purpose of examining the men. 3000 who had particular claims to respectability were sent back to Constantinople, whilst others, who, from physical defects or other causes, were unfit for service, were ordered to return to their native places in the provinces, and the remainder were enrolled in the army. When the women understood that their husbands and sons were thus being carried off, they left the harems, tore off their veils, and assembled round the mosques, uttering cries, and arming themselves with stones and sticks. Riza Pacha the Seraskier, had some difficulty in escaping, and even left in their hands one of the skirts of his coat. On some points the troops were obliged to give way, and the prisoners escaped. All the Albanians who were at Constantinople having got wind of the matter, hit on a mode of escaping from it. They got several coffins made, divided themselves into so many sections, placed their arms in the coffins, and every day funerals of some Albanians were seen to defile through the streets of the city; four carried the coffin on their shoulders, the rest followed. They were allowed to pass, and, once outside the walls of Constantinople, they resumed their arms, and took to flight, and not a single one remained in the city.—A boy who some time ago had been taken into the harem of a Bey, in Constantinople, and compelled to embrace the Mahommedan faith, has been sent to Sir Stratford Canning; and one of the Greek girls whom the Turks at Brousa had tried forcibly to convert, has been given up to the patriarch. We may look upon these as the first fruits of the concession which the Porte has lately made to England and France.

UNITED STATES.—We have accounts from New York to the 3rd inst. The journals are full of surmises regarding the fate of the pending negotiations on the Oregon Territory question and the annexation of Texas. It is stated that Mr. Pakenham has assured the Government of the United States, that England, under no circumstances, would receive Texas as a province or dependence of her own; the *New York Herald*, however, says "We learn from good authority that General Henderson has engaged a passage in the Acadia, which was to leave Boston on the 1st of May for England. This indicates the course he is to pursue in the event of the failure of the mission to Washington. That he would go to England if he failed here we stated before. This merely confirms that statement." The proceedings of Congress present nothing of interest to the English reader, except that numerous petitions had been presented against any further alteration in the tariff laws. The new Secretary of State, Mr. Calhoun, in a letter declining to accept a public compliment which some citizens of Charleston were desirous of offering to him, makes the following remarks:—"It is well known that I am the advocate of peace—peace with all, and especially with that great country from which we draw our origin, and of whose renown we well may be proud. There are no other two countries which can do more harm to each other, or confer greater benefits the one on the other. But as highly as I value peace, I hold it subordinate to the honour and just rights of the country; whilst, on the other hand, no consideration shall induce me to sacrifice the peace of the country by claiming more in the discharge of my duties than I shall honestly believe that the honour and rights of the country demand. Her true honour and interest consists, according to my conception, in claiming nothing but what is just and right, and in accepting nothing that is not."—The accounts from Cape Haytien bring intelligence that the Spanish part of the island had revolted against the present Government. The whole of the regular army, and all the national guard or militia, were nearly ready, and under marching orders against the revolters. 1500 soldiers left Cape Haytien on the 13th, and about 3000 arrived on the 14th March, on their way to the Spanish part. It appeared that the President was collecting all the effective force of that part of the island. One of King Christophe's Officers, a black man, General Perrot, commanded that division, and arrived at Cape Haytien on the morning of the 14th. It was thought that at least 30,000 men would march against the Spaniards; and if the latter were well prepared there would probably be some fighting. What the result will be it is difficult to predict, but these movements have the effect to depress trade, and make the produce of the island extremely scarce and high. The well-informed at Cape Haytien think the revolution will be put down with very little trouble.—Advices from Matanzas to the 28th March state that the disaffection among the slaves is more general than it was at first supposed. It is said that there are about 3000 slaves in irons on the different forts in the vicinity of Matanzas. Numbers are daily tried and immediately shot. A regiment of troops had just arrived from Havanna for the purpose of scouring the country. Business on some of the plantations is at a complete stand.

Parliament.

HOUSE OF LORDS.

Monday.—Lord CAMPBELL, at the request of Lord BROUGHAM, postponed the second reading of his Debtors and Creditors Bill, to Monday week.—The Marquess of CLANRICARDE gave notice to question the Duke of Wellington on Tuesday, as to the intention of Government relative to the Poor Laws in Ireland.—The Marquess of NORMANBY stated that he had been satisfied by the President of the Board of Control upon the subject of the Gwalior papers—an additional one of which was laid on the table by the Duke of BUCCLEUGH.

Tuesday.—The Earl of RADNOR questioned the Duke of Richmond as to his concurrence in the arguments put forth in the pamphlet lately published by Mr. Cayley.—The Duke of RICHMOND declined replying to such a question, though he had no objection to state that in his opinion the pamphlet was a very good one. His Grace complimented Lord Radnor upon having, since he took the chair in Covent-garden, become a very great actor; and added that he would never leave the Agricultural Protection Society until they had accomplished the object for which they had associated.—The Lord CHANCELLOR gave notice that he should move the second reading of the Dissenters' Chapels Bill on Friday, and take the discussion upon it on going into committee on Friday week.—The Earl of POWIS presented a great number of petitions against the union of the Sees of Bangor and St. Asaph.—The Marquess of NORMANBY raised some discussion on the subject of the exclusion of Catholics from a jury in Ireland, in which Lord WHARNCLIFFE, the Marquess of CLANRICARDE, and Lord CAMPBELL took part.—Lord WHARNCLIFFE said that they were not excluded because they were Catholics, and Lord NORMANBY expressed himself satisfied with the explanation.

HOUSE OF COMMONS.

Friday.—After Sir C. NAPIER'S discussion on the management of dockyards, a question was raised upon the selection of two stipendiary magistrates in Ireland.—Mr. BELLEW enlarged upon the general utility of such functionaries, but found fault with the appointment of these two gentlemen, Mr. Brereton and Mr. O'Brien.—Lord ELIOT justified the two appointments.—Captain BERNAL condemned the nomination of Mr. O'Brien, whose chief claim he suspected was this—that having formerly been violent in favour of repeal, he had now become as violent against it. Nothing would so much endanger Sir R. Peel's Government in Ireland as the employment of this description of subordinates.—After a few words from Mr. FRENCH, the subject was dropped.—Mr. HUME objected to the magnitude of the estimates for colonial services. All payments by the nation for which equivalent services were not rendered, had not only the effect of increasing the taxes, but of annoying the honest and industrious part of the community, who could not brook to see idlers living on the public money. He expressed his disapprobation of colonial companies like that of New Zealand. He enforced the expediency of reduction in expenditure, referring to the injury now sustained by commerce from the excise, some classes of which he deemed it incalculably important to abolish.—Lord STANLEY said that some of the heaviest expenses in the colonial estimates had been forced upon the Government by the circumstances in which several colonies had been left by companies of undertakers failing to fulfil the expectations held out by them to emigrants.—Mr. AGLIONBY courted a searching Parliamentary inquiry into the circumstances of New Zealand and the proceedings of its company, of which he was himself a member, and of whose moral responsibility he was fully conscious.—Sir R. PEEL observed that the Ministers of the Crown were quite as economically disposed as the House of Commons, by whom grants were often proposed which the Executive Government had to resist.—Mr. WILLIAMS objected, by anticipation, to several of the items which were to come on for discussion in the Committee—Indian pensions, grants for negro education, and allowances to Canadian clergy.—The Speaker then left the chair, and the Committee proceeded with the Estimates, item by item.

Monday.—Mr. BRISCOE took his seat for Hastings.—The North British Railway Bill was read a third time and passed, after a division, carried by 102 against 23. Other Railway Bills were advanced.—In reply to Mr. FRENCH, Lord ELIOT stated that it was not the intention of Government to introduce any measure this session, to regulate medical charities in Ireland.—In reply to Mr. BORTHWICK, Sir R. PEEL said that no special instructions had been given to Captain Drummond, commanding the Scout, off Alicant, with reference to the reception of fugitive Spaniards during the late insurrectionary movements in Spain; but only the general instructions given to all captains of British vessels of war, to afford protection to British subjects, and to observe, as far as possible, strict neutrality with the contending parties. In the report already received from Captain Drummond, no mention was made of any application for protection made by Colonel Bonet; and the accounts in the newspapers respecting the refusal of protection to that unfortunate person, were inconsistent with this report. The Right Hon. Baronet promised to desire Captain Drummond to furnish a statement of the transaction, and expressed his abhorrence and disgust at the sanguinary acts which had lately been perpetrated on the part of the constituted authorities in Spain.—The first order of the day was the second reading of the new Factories Bill, previous to which a large number of petitions were presented in favour of the ten hours.—Mr. T. DUNCOMBE gave notice of a motion to refer the bill to a select committee, with an instruction that evidence should be received as to the probable effect which the limitation of the labour of women and young persons to ten hours would have upon wages.—Mr. ROEBUCK also gave notice that, on going into committee on the Bill, he will move a resolution that it is not expedient for the Legislature to interfere with the labour of adult persons. Some conversation arose as to the most convenient course to be adopted in taking the discussion on the Bill, Sir J. GRAHAM suggesting that the second reading should pass unopposed, and the debate be reserved till going into committee.—Mr. T. DUNCOMBE remarked that it was no use deceiving themselves—the working classes did not anticipate a reduction of wages from the limitation of their hours of labour; and, therefore, it was highly expedient that the evidence should be gone into before a select committee. He strongly censured Lord Ashley, whose course in deferring discussion till the third reading he considered tantamount to an abandonment of the question.—Lord ASHLEY retorted that the operatives were as good judges of the matter as Mr. T. Duncombe, and would exercise their judgment with ten times more justice and candour. He read an extract from a letter which had been addressed to him by the Short-time Committee of Lancashire, in which they declared that all of them approved of the course which he intended to adopt with respect to the Bill.—After some discussion, the SPEAKER intimated that on Friday when the Bill is to go into committee, Mr. T. Duncombe's motion will be taken first, and will be put in the form of a proposition, that the order for going into committee of the whole House be discharged, in order that the question be put of referring the Bill to a select committee, with the view of receiving evidence as to what will be the effect on wages of the limitation to ten hours. When that has been disposed of it will be competent for Mr. Roebuck, or any other member, to propose any motion relevant to the subject.—Mr. FERRAND having affirmed that the working classes were universally in favour of the ten hours, Mr. ROEBUCK rose, and said he had an important question to put to Mr. Ferrand. He was reported to have alleged that a Minister of the Crown had used the influence of his office to induce a servant of the Government, an assistant poor-law commissioner, to make a false report to the House for the express purpose of crushing a member of it. He asked on what authority this grave charge was made?—Mr. FERRAND complained of want of courtesy in not being informed that this question was to be put. The charge which he had made was founded upon his old grievance of Mr. Mott, the Keighley union, and the conduct of Sir J. Graham, who had got a false report from Mr. Mott, and drew it out of his box on the table for the purpose of crushing him in the House.—Mr. ROEBUCK reminded Mr. Ferrand that he had not explained the charge that a Minister of the Crown had used the powers of his office to induce a false report to be made.—Mr. FERRAND would not be schooled by Mr. Roebuck. He had behaved himself in a way unworthy of a Member of the House and a gentleman.—Here there were loud calls of "order" and "chair," and the House became rather excited.—The SPEAKER called on Mr. Ferrand to retract this remark.—Mr. FERRAND would do so. But he admitted that he had said and believed that Sir J. Graham had abused the powers of his office in inducing a false report to be made to the house in relation to the Nottingham election.—Sir J. GRAHAM said that the proper course would have been to move that the words be taken down. But Mr. Ferrand must himself feel that the matter could not rest where it did, and that he must take the proper steps to bring the matter to an investigation. Mr. WARD, Mr. HUME, and others, pointed out such an allegation against a Member of the House, acting as its sworn servant in the capacity of the chairman of an election committee, was one too serious to be passed over.—Mr. HOGG, who acted as the chairman of the Nottingham election committee which unseated Mr. Walter, indignantly demanded a full investigation of the charge, that he, a sworn servant of the House, had suffered a Member of the Government to influence him in discharging a sacred and solemn duty. When the accusation was originally made in the *Times*, he had been advised by Members on both sides of the House to take no notice of it. But now it was imperative that the charge should be substantiated or disproved, and either he or his calumniator covered with deserved obloquy.—Mr. FERRAND complained of being taken by surprise, without time to collect his proofs. They were "higgling and haggling" over his expressions; but he admitted that he believed all that the *Times* had advanced on the subject of the Nottingham election. Attempts were made in the House to crush him, by those who dared not meet him on the hustings.—Sir J. GRAHAM said there should be no "higgling and haggling" in that House. Let Mr. Ferrand take till next day to collect his proofs, and come down prepared to make his charge. He hoped that the House would compel his accuser to do so.—Mr. HOGG would also then meet any charge which might be made.—Lord J. RUSSELL said that the question was not one merely as to the use or meaning of certain expressions. A charge had been made affecting the characters of Sir J. Graham and Mr. Hogg, and Mr. Ferrand must either prove something which could justify his allegation, or submit to the imputation of being a calumniator.—Sir R. PEEL adverted to certain words which Mr. Oastler, in a speech, had imputed to him. He was reported by that individual to have said, in conversation, that on the ten hours the Christian feeling of the House had beaten the Government. He could recollect nothing he had said which could possibly be construed into an approach to this expression, unless, indeed, it were, that if members took time to consider what they were about, the Government would be in a majority.—Here the matter dropped, and the Factories Bill was read a second time.—Dr. NICHOLL moved the second reading of the Ecclesiastical Courts Bill.—Sir G. GREY objected to it, as leaving untouched the great evils of the Diocesan Courts, and moved its second reading that day six months.—Sir ROBERT INGLIS hoped he should be assured by his Right Hon. Friend the Secretary of State for the Home Department, that this Bill was to be considered not as an instalment, but a final measure in reference to the whole system of ecclesiastical jurisprudence, and then, and not until then, should he vote for the second reading.—Sir J. GRAHAM did not hesitate to state that he retained all the opinions which he had expressed in reference to the policy of the Bill of last year, and that he greatly preferred that Bill to the present. If his hon. friend asked him whether there was to be any further legislation upon this subject, he could only say, and he should do so frankly, that according to the experience which he had had of Ecclesiastical Court reforms, his belief was that, if this Bill passed, he was not likely again to meddle with such a subject during his life. Although he said this, he was bound also to state that he meant to propose a clause having for its object the affording of facilities for ulterior changes. The clause to which he alluded would notify, that parties who entered the profession of proctors at Doctors' Commons hereafter would have no claim for compensation, in the event of changes taking

place. After a discussion, in which Lord R. GROSVENOR, Lord J. RUSSELL, Colonel SIBTHORPE, Mr. ELPHINSTONE, and Mr. WATSON took part, the House divided—For the second reading, 158—For the amendment, 89—Majority, 69.—Mr. DUNCOMBE then charged Sir R. Peel with inconsistency in bringing forward this measure. He could not, he said, understand how the Right Honourable Baronet could reconcile the Bill before the House with his asseveration that, "So help him God," it was an honest measure. In his (Mr. Duncombe's) opinion, so help him God it was one of the grossest jobs ever perpetrated.—Sir R. PEEL had used these words in perfect truth; and would, even now, press the Bill of last year, if there were any chance of carrying it. But they had received no very cordial assistance from the Opposition, and were now reduced to the necessity of contenting themselves with a less adequate measure of reform, if they did not wish to abandon it altogether. A combination of vested interests was the chief impediment to the passing of that Bill; and though an executive could perform no greater service to the country than the undertaking of reforms, he who proposed to effect reforms in the law must lay his account with proceeding very gradually. He deprecated these recriminations; and Lord J. Russell, knowing the difficulties which beset an executive Government, and recollecting the course which he had adopted on various questions, should be more sparing of charges of humiliating positions, and so forth. He would allow to every man the privilege of changing his opinion, if he manfully avowed the ground of his convictions.—Mr. C. BULLER remarked that Sir R. Peel had lost sight of the honesty of the Bill in vindicating the honesty of his intentions. Shrinking from the opposition which they encountered last year, they brought in the present miserable Bill, which created twenty-nine new Judgeships, but grappled with none of the real evils of the system.—Dr. NICHOLL made a few observations in reply, and the Bill was then read a second time.—Sir J. GRAHAM then proposed that the County Courts Bill should pass through committee, *pro formâ*, in order to introduce some alterations, with the view that it should proceed hereafter *pari passu* with the Superior Courts Common Law Bill. After some discussion this was adopted.—In answer to Lord J. RUSSELL, it was stated that the Irish Registration Bill would not come on till after the 6th May.

Tuesday.—Mr. BARING took his seat for Huntingdon.—Sir R. PEEL, in answer to Dr. Bowring, stated that a treaty had been signed between Prussia, on the part of the Zollverein, and the United States, for the mutual admission of articles at rates lower than if imported from Great Britain or other countries. But though signed, the treaty was not yet ratified; and as two-thirds of the Senate of the United States were presumed to be opposed to it, the result could not at present be anticipated.—Mr. LABOUCHERE pointed out that by treaty the manufactures of this country should be imported on the same conditions as those of the most favoured nations.—Sir R. PEEL said that the attention of the Government had been called to this; but as the treaty between the United States and Germany had not yet been ratified, he would not say anything more at present.—The House, which was very full, in anticipation of the expected explanations, had its impatience at last gratified by the SPEAKER calling on Mr. FERRAND, who immediately rose and spoke as follows:—"Sir, I have, during this morning, minutely examined into all the speeches which I made in the manufacturing districts during the Easter recess, and which have been published in the *Times* newspaper. I have paid particular attention to the leading article of the *Times*, in which were quoted certain extracts from speeches of mine, which bore on the right hon. the Secretary of State for the Home Department, and the hon. and learned member for Beverley. Sir, it is not my intention to retract one syllable which I used in those speeches, nor to extenuate or explain away a single sentence. When I made use of that language, I asserted the sacred prerogative of a free-born Englishman, and I expressed my opinion upon the public conduct of two public officers. Sir, I defy this House to deprive me of that privilege. The opinion which I formed of the conduct of those two public officers is supported by the public press of the country, and is backed by public opinion. But, Sir, if, in making use of those expressions, I have in any way wounded the personal honour of any member of this House"—This last expression having been drowned in a shout of exultant derision, which arose ere it obtained complete utterance, Mr. Ferrand did not attempt to proceed, but abruptly finished his address thus:—"Sir, the party spirit and unmanly bearing which was exhibited towards me last night, and persisted in this instant, should remind those Honourable Gentlemen—and I am sure, Sir, I shall be backed by the feeling of Englishmen at large—that this House is the last tribunal for them to appeal to." He then left his place, bowed to the Speaker, and slowly walked out of the House, amid repeated roars of laughter.—Mr. BORTHWICK being about to bring on the next motion, Mr. ROEBUCK asked whether it was fitting that the matter of Mr. Ferrand's charges should end in this way? He was himself prepared to make a motion on the subject, rather than suffer such a termination.—At last, the general call being in favour of Mr. HOGG, he rose and said he claimed, not the protection but the justice of the House. In this respect he had a stronger claim even than Sir J. Graham; for though he, as a Minister of the Crown, had a right to protection, still Mr. Hogg thought that, acting as he did, as the sworn servant of the House, and assailed in that capacity, it devolved on the House to investigate the allegation made against him, and either to visit him with merited punishment or to pass a resolution declaring the accusation false and calumnious. He then read that portion of Mr. Ferrand's reported speech which contains the charge, and pointed out that it was no question of a difference of opinion, as to whether his law were right or wrong, but the distinct allegation that he was actuated by impure motives. Those more conversant with the usages of the House might suggest what course should be adopted, for vindicating his honour, and stigmatizing those who had cast upon him so foul an imputation. In a public journal of that morning (the *Times*), there was contained a base insinuation, as false as the other. It was, that while he was acting as chairman of the Nottingham election committee, he had asked for some official appointment. To this he gave a reiterated and emphatic denial, and sat down amid great cheering from all sides of the House.—Sir J. GRAHAM intimated that the manner in which Mr. Ferrand had fled—literally running away from both his accusations—disposed him to leave the matter where it was. But as the honour of every member, all of whom were regarded as "honourable," was in the hands of the House, it was for it to determine what course it should adopt.—Sir R. PEEL said that it was a matter of choice for the House, either to treat the matter with ridicule, or seriously. If the latter, then he suggested that they should adjourn the debate, in order to afford time to look into precedents; for they might incautiously establish one which might hereafter be abused by the power of a majority. For himself, he thought the whole affair had no parallel since the day when the conjuror advertised that he would compress himself into a quart bottle, and at the appointed time suddenly disappeared.—Lord J. RUSSELL said, that as Mr. Ferrand had neither withdrawn nor retracted his accusations, and had fled from their proof, it was important to determine what course should be adopted. As Mr. Hogg had claimed the protection of the House, he, for one, was quite prepared to vote for a resolution, declaring the charge against him to be false and calumnious. The case, as respected Sir J. Graham, would differ in point of form, as he had not claimed the protection of the House. If they left the matter where it now was, they would be liable to the imputation of being indifferent to their character in the eyes of the country.—Lord STANLEY concurred in opinion that the debate should be adjourned, for there was no precedent to such a case. There was not an individual member who did not believe, not merely in the utter groundlessness of the charges, but that Mr. Ferrand knew, when he made them, that they were utterly incapable of proof. He came down with an air of boldness, as if he were about to substantiate his charges, and at the first breaking out of natural indignation, declared that he would not submit to the jurisdiction of the House, or retract his gross and libellous imputations. The matter was in the hands of the House, and did not depend on the fact that any one member had claimed its protection. Time should be taken for reflection as to the course to be pursued.—The SPEAKER, who was appealed to, advised all discussion to be dropped, and that the course pursued in Mr. O'Connell's case should be adopted, which was to read the accusation, and Mr. Ferrand's admission of it, at the table of the House, and then to proceed according to pleasure.—After some remarks from Mr. BLACKSTONE and other members, the debate was adjourned.—Mr. BORTHWICK then moved an address to her Majesty, praying that measures might be taken to restore the Convocation to the Church; but while he was speaking, the House was "counted out."

Wednesday.—The Marquess of BLANDFORD took his seat for Woodstock.—Sir J. GRAHAM introduced the case of privilege, by moving that the passages in the speeches of Mr. Ferrand, containing the two charges against the Home Secretary and Mr. Hogg be read by the clerk at the table. This having been done, the SPEAKER inquired if the member for Knaresborough was in his place? No answer having been returned, Sir R. PEEL rose, to tender his advice to the House, as to the course which should be adopted. He had referred to the three cases in recent times, analogous to the present one—that of the complaint of Lord Maidstone against Mr. O'Connell, of Mr. Sheil against Mr. Hill, in the case of "Who's the traitor?" and that of Mr. Blackstone, who, when he was chairman of an election committee, was accused of corruption. The result of his consideration was, that the House should proceed with a strict adherence to all established formalities. Mr. Ferrand had admitted the correctness of the report of his speeches containing the charges; but strict justice required that no advantage should be taken of these admissions. He would give him the opportunity of once more unreservedly acknowledging or denying the accuracy of his reported charges; and if he admitted their accuracy, to allow him the privilege of attempting their proof before a select committee. He would therefore move that the complaint be taken into consideration on Friday next; and if that were affirmed, to follow it with another—that Mr. Ferrand be required to attend in his place on that occasion.—Lord J. RUSSELL approved of this course.—Mr. FRENCH protested against. The accuracy of the reports was questionable, though he admitted Mr. Ferrand was unfortunate in not having a better command of his tongue.—Mr. T. DUNCOMBE did not approve of any round-about method of procedure. Why not appoint a committee at once? Had he been placed in Mr. Ferrand's position, he would have demurred to the right of any member to question him as to what he had said elsewhere, and would have offered him any satisfaction, in the House or out of it. But if Mr. Ferrand could not sustain his accusations, the more manly course would have been to acknowledge his error.—Mr. D'ISRAELI disapproved the general tone of Mr. Ferrand's addresses, but he did not approve the course which the House was now taking. Mr. Hogg might have asked some man of sense and temper to apply to Mr. Ferrand, and the result, he believed, would have been satisfactory to Mr. Hogg, and not degrading to Mr. Ferrand; or Mr. Hogg might have made his own complaint to the House. But Mr. Hogg had done neither; and then Mr. Roebuck, who constituted himself public accuser, put his question, and this without the common courtesy of a notice. Sir R. Peel had certainly proposed a course which would bring back some decorum into the proceedings of the House; but it would be still better to let the matter drop altogether. Was it to be said that the House must erect itself into a court of honour, whenever a charge was made by one member against another? The House did not so behave when Sir R. Peel charged a member with the much graver offence of making a speech that stimulated to assassination. But Mr. Ferrand, being a man without a party to back him, had been baited and bullied on all hands. He himself did not sympathise in Mr. Ferrand's views; on the contrary, he had told the hon. member, that he thought he had a bad case, and a worse tribunal. Indeed he could not wonder, that from such a tribunal Mr. Ferrand had chosen to withdraw himself. As to the Keighley Union case, he owned he had never understood it; but nobody could deny that there had been a great many obscure and suspicious circumstances about it; and it was natural enough that Mr. Ferrand's imagination should have been inflamed when he found himself engaged in a contest with a Minister of the Crown, and pardonable that he should have held the sort of language which had been used by him. Surely things must be come to a strange pass, if the House of Commons were compelled to interfere on such a matter as the present, for the purpose of rescuing this strong, if not popular, Ministry. He had been much gratified with Sir R. Peel's precedent of the bottle conjuror; but how far Lord Stanley's speech had been an example of the forbearance and conciliation which he recommended to Mr. Ferrand, was another question. Lord Stanley was the Prince Rupert of the House: his charge was irresistible; but when he returned to his camp, it was always in possession of the enemy. It had been truly said that gentlemen, if they choose to tell lies on the hustings, ought not to tell them in the House. But he would go further: he thought they ought not to tell lies even on the hustings, and if a man chose to declaim against the Poor Law there, he ought not to come hither and vote for it. If any man did this, that man was guilty of corrupt conduct, and might now move a censure against him for saying so. He would remind the Prime Minister of what had been said by a former, though not greater, Sir Robert, who, when Sacheverell had been long baited and worried, declared himself tired of roasting a parson.—Captain BERKELEY did not think the case was one of which Mr. Hogg could have fitly made a personal quarrel; nor did he consider it consistent with the dignity of the House that the matter should be suffered to drop. There was a party in that place who had been accustomed to cheer all the violences of Mr. Ferrand, and they were in great measure the persons responsible for the scrape he had got into.—Lord J. MANNERS moved the previous question. He contended that the speech of Mr. Ferrand did not convey the sort of imputation upon Mr. Hogg which it had been assumed to involve. The newspapers might have given it that construction; but it ought to be judged of by itself, and not by the constructions of other people. As to the charge against Sir J. Graham, that right hon. baronet, who must be the best judge in his own affair, had declared himself content that the matter should be passed over.—Mr. SMYTHE seconded the amendment of Lord J. Manners. He had no adverse feeling to Sir J. Graham, whose straightforward conduct he highly eulogised; and he considered Mr. Ferrand to labour under as extraordinary hallucinations respecting the character and conduct of the right hon. baronet as respecting the employment of machinery. Nor did he question the integrity of Mr. Hogg, whom he believed to have been influenced by no worse motive than an outrageous sense of public virtue. But he could not concur in a proceeding the object of which was to compel Mr. Ferrand to prove his belief. No man in that House could prove his belief upon any subject discussed there. Seeing that all this mischief was owing to the member for Bath, he had himself a belief though he could not prove it, that there was some understanding between purity and power; for that spurious patriot, while he attacked all others, spared one great person, and intimated plainly enough that if he were not the Diogenes of Bath, he would like to be the Alexander of Tamworth. That learned member had now effected a combination of two remarkable positions—that of the rebels' agent and the Queen's counsel.—After a few words from Sir R. INGLIS, Mr. ROEBUCK rose. Mr. Ferrand, he said, had admitted having used the words ascribed to him; and as to the complaint that there had been no notice, surely, if a member were charged with a robbery, he wanted no notice in order to be prepared for a denial. Was this a matter to be got rid of by the somewhat cowardly expedient of the previous question? That meant, that the House desired to express no opinion whatever. But ought the House to express no opinion upon a question whether a Minister of the Crown had used his power to crush one of its members? It was the duty of the House to see that no Minister did so use his power; it was his own duty, as one of the members of that House, to look to this. The accuser had fled from his own charge; still the House, in its courtesy, proposed to give him a further opportunity for explanation; and all men would be glad if he should now, on consideration, candidly retract his words. Lord J. Manners laid claim to feelings of sanctity in matters of high account; did he concur with Mr. D'Israeli in the suggestion that this matter ought to have been settled in what was commonly called a gentlemanly way—an apology if attainable; if not, then a duel? Surely, after the late horrors, it must be felt that such a proceeding would have been a disgraceful one.—Mr. SMYTHE rose, and accused Mr. Roebuck of imputing to Mr. D'Israeli, that he was actuated by feelings of political disappointment, but loud cries of "chair," and the interposition of the SPEAKER, stopped the farther progress of this fresh ground of quarrel.—Lord HOWICK was inclined to adopt that view of the case, which would contemptuously allow the matter to drop, thereby showing their utter disbelief of the accusations. If their opinion of the public went with them, a vote of censure was unnecessary; if it did not, it was useless, while the precedent would be established of noticing every case in which a member of the House might think his honour impeached by groundless charges. Were they still further to waste their time, on Friday next, when grave matters were set down for deliberation by fresh discussion on this most trumpery case?—Mr. HUME gave his reasons for considering that all who voted for the "previous question" would lend a sanction to the accusations.—Sir J. GRAHAM pointed out how the matter actually stood. The accusations had been brought under the notice of the House, and both he and Mr. Hogg had then felt it their duty to bring them forward in a formal manner. But having himself often said things which he regretted and had wished to retract, he would be quite satisfied if Mr. Ferrand would attend in his place on Friday and express his regret for having spoken in a way which he could not sustain. If he did so, all recollection of the charge would be effaced from his mind.—Mr. HOGG would also be quite satisfied if Mr. Ferrand would adopt the suggestion, and in that case would also forgive and forget.—Lord JOHN RUSSELL approved of this prospect of an amicable termination of the affair; and Lord JOHN MANNERS withdrew his amendment, protesting against the imputation that he approved of duelling.—The original motion for the attendance of Mr. Ferrand was then put and carried.—The House afterwards proceeded to the regular business, taking the County Coroners Bill, which stood for farther consideration; but Mr. HUME opposed a certain proposed addition of "three-pence" per mile, which has already been a matter of much debate, and in the thin state of the House the managers of the Bill were compelled to postpone its further consideration.—Mr. FRENCH next rose in a House of about 20 Members, to call attention to the Dublin Jury-lists, but his discourse was cut short by the counting out of the House.

Friday.—A new writ was issued for Horsham.—The Leeds and Bradford Railway Bill was recommitted on a division by a majority of 158 to 56.—In reply to Mr. MACAULAY, Sir R. PEEL said that he had received a letter from the Directors of the East India Company, stating that they had, in the exercise of the power which the law gives them, thought fit to recall Lord Ellenborough from the office of Governor-General of India.—Mr. ROEBUCK called the attention of the House to a breach of privilege in the shape of a challenge sent him by Mr. Smythe, the Member for Canterbury. The letter was put in and read by the Clerk of the House. Mr. SMYTHE said that it was only a demand for an explanation of certain terms which Mr. Roebuck had applied to him in debate.—Sir R. PEEL called on both gentlemen to state that the matter should end there; and the requisite assurance was given. Sir R. PEEL moved the consideration of the complaint of Mr. Ferrand's accusations.—The SPEAKER asked whether the Hon. Member for Knaresborough was in his place?—Mr. FERRAND having answered, the Clerk read the extracts complained of.—Mr. FERRAND said he owed an apology to the House for having taken up so much of its time. Had the Hon. Member for Bath not taken him unawares, he should have given the answer the hon. Member for Finsbury suggested. But in the hurry of the moment, he was sorry to say he had adopted the course he had. He owed another apology to the working classes for having detained the House from the consideration of a question that night that was a question of life and death to them. If he had wounded any man's feelings, he should always be ready to give that satisfaction that one man of honour had a right to expect from another man of honour. He had said on Monday that he believed all that was reported in the *Times* on the subject was correct; but that he would examine them carefully. He had done that, and came down, accordingly, to the House. The House was in error if they thought he had fled owing to the rude and unmanly conduct of the Hon. Member opposite. He repeated that he had uttered all that was reported in the *Times*. He had left the House, as he had thought that was the proper course. He had now obeyed the summons of the House to attend in his place that day, as he would obey every order they were entitled to issue. None had acted better in the chair than the Right Hon. Gentleman who now occupied it; but that Right Hon. Gentleman had found the difficulty of his position in that self-constituted court of honour. When that common informer (loud cries of order.) Well, he would recal the words, but not the sentiment—that public informer and accuser had attacked him and charged on him the crime of which the Honourable Member himself alone was guilty. He protested against such proceeding in the name of the people of England; and in their name he declared that self-constituted court of honour to be illegal; and in the name of the people of England he refused to plead at its bar.—Sir J. GRAHAM said that the hon. member for Beverley had denied the accusations against him; and he now rose to speak on the subject of the accusations against himself. As the accused, he was entitled to ask the house for an acquittal, or at all events a hearing. He had endeavoured to ascertain whether there had been any communication between him and Mr. Mott; and had been unable to find any trace of any communication with that assistant commissioner or with the other Poor-law Commissioners, with reference to the particular union in question. Further, he had ascertained that not even any verbal directions had been given by him on the matter. He now declared he had never issued any directions respecting that report. The statement of the Hon. Member for Knaresborough was, therefore, entirely unfounded. The dismissal of the alleged tool was nearly a conclusive denial in itself of the accusation. [Left sitting.]

CITY.

Money Market, Friday.—Consols closed at 99¾; Reduced Three per Cents., 98⅞; Three-and-half ditto, 102; Three-and-half New, 102⅞; Exchequer-bills, 75 to 77 pm.

GAZETTE OF THE WEEK.—BANKRUPTS.—W. AUSTIN, Bell-street, Edgware-road, builder—E. GRAHAM, Dover-street, Piccadilly, engineer—H. CHANNELL, Southampton, coal-merchant—W. READ and E. PAGE, Ipswich, shipbuilders—F. H. WARD, Arbour-terrace, Commercial-road, ironmonger—G. SMERTON, Stratford, Essex, horse dealer—J. B. KING, Newgate-street, merchant—W. BROWN, Rickmansworth, Hertfordshire, auctioneer—A. BATTY, Birkenshaw, Yorkshire, innkeeper—R. JACKSON, Leeds, machine-maker—W. LLOYD, Liverpool, wine-merchant—S. BROTHERS, Newcastle-under-Lyme, Staffordshire, currier—G. PARK, Charles-street, Commercial-road, Stepney, cowkeeper—S. BACHE, Milford Cottages, Commercial-road, Peckham, builder—B. W. BLAKE, City-road, merchant—H. HAYON, Ratcliff-Highway, Middlesex, engineer—J. W. ROBEY, Upper John street, Fitzroy-square, builder—W. ROBERTS, Newport, Monmouthshire, draper—T. BLACKHAM, Chorlton upon-Medlock, Lancashire, common brewer—W. ASHWIN, Birmingham, steel pen maker—R. HARRIS, Liverpool, eating house keeper—R. NEWMAN, Leeds, corn factor—J. SIMPSON, jun., and W. TOPP, Wakefield, manufacturing chemists.

— SCOTCH SEQUESTRATIONS.—G. BLACK, Kilmarnock, grocer's merchant—G. ROSS, Kilmarnock, calico printer—J. G. SCOTT, Glasgow, and E. POWELL and Co., Manchester, mousseline de laines printers—J. BELL, Pendreoch, Perthshire, innkeeper—W. FRAME, Glasgow, provision merchant—J. SMITH, Glasgow, upholsterer—R. BAUCH, Dunse, tailor—Dr. J. WALLACE, Aberdeen—G. SHARP, Newbigging, near Musselburgh, baker—R. L. RAE, Princes-street, Edinburgh, grocer.

Metropolis and its Vicinity.

Houses of Parliament.—On Saturday afternoon, after the meeting of the Fine Arts Commission, of which his Royal Highness is chairman, Prince Albert proceeded to the new Houses of Parliament, accompanied by Viscount Palmerston, Lord Colborne, Mr. Gally Knight, Mr. Hallam, and Mr. Wyse, members of the Commission. Upon his Royal Highness's arrival, he was received by Mr. Barry, the architect, and Mr. Grissell. The visit was understood to be a formal one, suggested for the purpose of ascertaining the progress made in the erection of the new Houses of Legislature; and, by inspection of the various compartments to form an opinion as to which of them were best suited for displaying the frescos, statues, and other works of art. His Royal Highness and the other Commissioners minutely examined the different portions of the building, and subsequently visited the model-rooms. After inspecting models of the interior of the House of Lords, they proceeded to Mr. Barry's offices, where the details were laid before the Prince, who expressed his satisfaction with the progress of the works.

Exhibition of Decorative Works.—An exhibition of the decorative works for the new Houses of Parliament, sent pursuant to the notices issued by the Commissioners on the Fine Arts, was opened for public inspection on Monday, in King-street, St. James's. The numbers in the catalogue extend only to 170, but there are in many cases several specimens by the same artist included in the same number. The objects exhibited are for the most part carvings in wood, designs, and specimens for painted windows, and different kinds of pavement, principally Mosaic. The designs and specimens for the principal door of the House of Lords are one-third the whole number. Of these several are favourable specimens of the state which the revived art of carving in wood has already attained in this country. Many of the designs for the great door include figures of saints and kings; but the most appropriate for such a purpose are those composed of Gothic tracery alone. The designs for stained glass windows are all subject to the condition imposed by the Commissioners, that they should be in general accordance with the style of architecture and decoration adopted in the new Palace; and some of the artists appear to have felt themselves bound so implicitly to adhere to the ancient style as to copy even faded colours. The favourite subjects are the designs of armorial bearings, and the portraits of the Kings and Queens of England with their arms and supporters. The designs for ornamental paving form the most numerous objects in the exhibition. The general character of the articles is Mosaic work, and some of the artists have thought it good taste to imitate the burnt and faded pavement dug out of Herculaneum and Pompeii. There are several articles admitted into the room which have not been inserted in the catalogue, because they have not strict reference to the conditions of the notices by the Commissioners, among which are some handsome and massive wreaths of flowers carved in wood, most elaborately executed, that appear to be in imitation of the ornamental devices round ancient fire-places. There are also some specimens of iron casting, but they are scarcely worth notice; all attempts at ornamental work in metal being far distanced by some electrotyped groups of natural vegetation.

The Welch Bishoprics.—On Monday a special general meeting of the members of the Society of Ancient Britons was held, to adopt measures for preventing the amalgamation of the sees of St. Asaph and Bangor, as contemplated by a recent Act of Parliament. Earl Powis was called to the chair, and was supported by Lord Kenyon, Lord Clive, Colonel Powell, M.P., Townsend Mainwaring, Esq., M.P., R. Richards, Esq., M.P., Archdeacon Newcombe, the Hon. Rice Trevor, M.P., Serj. Atcherley, and about eighteen or twenty noblemen and gentlemen. The meeting was addressed by Lord Kenyon and others, and the following resolution was unanimously adopted:—"That this meeting, feeling the obligation they owe to the Earl of Powis for his able and zealous exertions on behalf of the Welch bishoprics, and being convinced of the necessity for the continuance of those exertions, and that the conduct of the petitions and prayers cannot be confided to abler hands, beg respectfully to request that he will proceed in such manner, in connexion with our Welch Bishops and friends, as he shall think best calculated to effect that pious and most interesting object."

Society for the Emancipation of Industry.—On Tuesday evening a meeting of the supporters of this institution was held for the purpose of giving publicity to, and adopting steps to further the objects of the society. Among the gentlemen present were several Members of the House of Commons. Mr. Spottiswoode was in the chair, and explained the nature of the meeting. The country, he said, was detached into various classes, who each professed to have a remedy for the existing evils, but whose professed remedy was fallacious and fanciful. It was in the principles of that society alone that a remedy was to be found, and pamphlets and tracts had been published to explain them. It had, however, been ascertained that explaining them verbally was much more effective, and much more conducive to the interest of the society than by promulgating them through the medium of tracts. It was, therefore, their intention to hold weekly meetings in London, until the public were fully made acquainted with their objects. The principles they advocated were not new; on the contrary, they were as old as Aristotle and Plato, and had been entertained by all learned men from their day down to the present time. They merely assembled together to explain that the principles held in the time of Aristotle were worthy of attention now. Previous to the year 1819 twenty millions were paid annually towards reducing the national debt, but since then not a single farthing had been paid. It was clear, then, the present monetary system of the country and standard value of gold was wrong, and they were determined to agitate until they obtained some reform, or were convinced their views were erroneous. Mr. Attwood, of Birmingham, then addressed the meeting, advocating at some length the revival of the Bank Restriction. He never heard of any objection being raised to it when in existence; certainly it never was petitioned against by the people, while, to his certain knowledge, 360 petitions were, in 1819, presented to the House of Commons against the then proposed change. It was the means of carrying the country through a long and tedious war, and he had no hesitation in expressing his firm conviction that, unless the Bank Restriction were again revived, a revolution would ultimately be the fate of this country. Mr. Muntz, M.P., and several other gentlemen also addressed the meeting at some length, advocating a free trade in gold, and an entire change in the monetary system.

Governesses' Benevolent Institution.—The first anniversary dinner of this charity, which has been established for the threefold object of affording assistance to governesses in temporary distress, of raising an accumulating fund to grant annuities to governesses in their old age, and a provident fund to aid governesses in securing annuities for themselves on Government security, was held on Saturday, at the London Tavern. H.R.H. the Duke of Cambridge presided, and was supported by the Earl of Dartmouth, Earl Jermyn, M.P., Viscount Sandon, M.P., Lord H. Cholmondeley, Lord Calthorpe, Lord Teignmouth, Sir W. Jolliffe, Bart., B. B. Cabbell, Esq., C. Dickens, Esq., &c. After the usual toasts, the Secretary, the Rev. Mr. Laing, read the report, which afforded evidence of the progress making by the society, and the utility of its exertions. Between 60 and 70 governesses had already joined the institution, and upwards of 2000*l.* had been subscribed towards its support, 500*l.* of which was funded, in order that an annuity of the value of 15*l.* may be granted next month. In regard to the third object of the society, the relief of governesses in temporary distress, the report stated that from the 14th June, 1843, to the 25th March, 1844, the ladies' committee have received and examined into 102 applications, and had assisted 56 of that number: some of the others were desirous of loans, a means of help which it was considered did not yet form one of the objects of the society—some few did not produce satisfactory references, and many more were reluctantly declined for want of sufficient funds. The cause of the charity was advocated by the Chairman, by Lord Sandon, Mr. Cabbell, and Mr. Dickens, and subscriptions exceeding 1000*l.* were announced.

The Wellington Statue.—At the last meeting of the Royal Exchange Committee on the subject of placing the statue of the Duke of Wellington, the trustees, Mr. Masterman and Sir P. Laurie, and the executors, Mr. Turner, R.A., and Mr. Jones, discussed at considerable length the question as to the most eligible position of the statue in front of the Exchange. Sir P. Laurie stated that Sir F. Chantrey always expressed a wish that the statue should face the south, in order that it might have the advantage of the sun, for which purpose he suggested the removal of the ugly upper story of the Mansion-house, which was accordingly taken down to the manifest improvement of that edifice. Mr. Jones confirmed the statement as to the opinion and wish of Sir F. Chantrey. The committee, however, came to the resolution that as the front of the Exchange faced the west, it would be preposterous to turn the face of the statue away from that direction, and they accordingly agreed unanimously that the Duke should front Cheapside. Mr. Turner the other executor, informed the committee that the statue and pedestal had long been completed, and he trusted that by the 18th of June, the anniversary of Waterloo, the public would have a complete opportunity of judging of the performance.

The Public Streets.—A deputation from the committee for promoting the greatest attainable cleanliness in the public thoroughfares, courts, and alleys of the Metropolis, waited upon the Lord Mayor last week upon the subject of calling a meeting in furtherance of the purposes for which the noblemen and gentlemen of whom the committee is formed have frequently assembled at the West-end. Among the members of the deputation were Viscount Ranelagh, Sir J. Hamilton, Bart., Dr. Holt Yates, Mr. C. Cochrane, &c. The latter gentleman stated that the object of the deputation in waiting upon his lordship was, to read to him the substance of resolutions passed at a meeting at the Hanover-square Rooms, relative to the immediate employment of the able-bodied poor, in the hope that he would assist in accomplishing an object calculated to do important service to the physical and moral condition of the public. Mr. Cochrane then referred to the leading facts connected with keeping the streets free from mud and dust, according to an experiment which had been successfully tried in Regent-street and Oxford-street, and expressed the persuasion of the committee that, as his lordship's efforts had already improved the streets of London as to cleanliness, he would readily aid in a great plan for more completely carrying out the intentions he had expressed at the commencement of his mayoralty. The committee would willingly pay the expenses of the experiment, if it should not meet with the approbation of those who were best qualified to judge. The cleansing of the streets of the city cost, according to the clerk to the commissioners of sewers, about 4000*l.* a year. The plan the committee recommended would, with all its advantages, cost no more than from 2000*l.* to 4000*l.* more than that sum. The Lord Mayor, after some observations from other gentlemen of the deputation, said that, in his opinion, the most advisable course would be, that he should communicate with the chairman of the commissioners on the subject of making an experiment on the plan adopted in Regent-street and Oxford-street, and if the experiment should be made, and found successful, that he should call a public meeting, with the view of carrying it into effect all over the city.

Trafalgar-square.—The whole of the terrace-walks within the area of this promenade were finally completed yesterday, and the square will be opened to the public on Monday next. The paving laid down in the quadrangle has been the work of the Bastenne Bitumen Company.

Schools for All.—The first stone of a new building in Chequer-alley, St. Luke's, founded by Mr. Greig, of the Society of Friends, for children and adults of all denominations, and called "Schools for All," was laid on Wednesday by Lord John Russell, in the presence of a large assemblage. The proceedings commenced with prayer; but the building was crowded to such an extent, and the confusion was so great, that despite the efforts the police made to preserve order, the interruptions were frequent and occasionally difficult to overcome. In addition to Lord J. Russell there were present Mr. Hastie, M.P., Mr. Sheriff Moon, Mr. Samuel Gurney, &c. Lord John Russell, Dr. Morrison, and other gentlemen addressed the meeting in support of such establishments as the present.

Anti-Corn-law League.—The weekly meeting of the League was held on Wednesday in Covent Garden theatre, the Hon. C. P. Villiers in the chair. The chairman opened the proceedings with a long speech on the prospects of free trade, after which the meeting was addressed by Mr. Ewart, Dr. Elphinstone, and Mr. Moore.

The New Bridge.—The plans of a new suspension-bridge between Lambeth church and the Horseferry-road, have been submitted to the churchwardens and other officers of Lambeth, with a view to obtaining their signatures to the petition for the bill now before Parliament. It is to be an iron suspension-bridge of three arches, with very little rise on either side, and to be built under the direction of Sir S. Brown, the inventor of the Brighton-pier. At the interview Sir S. Brown had with the parochial officers they at present declined signing the petition in their official character, whatever their private opinions might be. It was arranged that the parishioners should be consulted on the matter in the first instance, but a feeling was expressed that a suspension-bridge would not answer for the heavy traffic which would no doubt pass over it. Is is also said that, however beneficial it may be to Lambeth and St. John's, Westminster, it is likely to injure Vauxhall, and Lambeth Marsh and the vicinity.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending April 13th—West Districts, 128; Northern, 164; Central, 165; Eastern, 182; Southern, 231; Total, 870. Weekly average for the last five years, 946.

Provincial News.

Factory Meetings.—The following meetings in favour of the ten hours clause in the Factories Bill have taken place since our last report:—At Blackburn, on Saturday; at Stockport and at Oldham, on Thursday; at Ashton, on Saturday, and at Bury on Tuesday last. At all these places resolutions in favour of the clause were unanimously passed, and petitions founded upon them were adopted for presentation to Parliament.

Chatham.—The Mutine and Espiegle, 12-gun brigs, which are to form an experimental squadron with the Daring, Osprey, Kingfisher, and Flying Fish, ships of the same class, in the month of June next, for the purpose of testing their relative capabilities at sea, were launched on Saturday at this dock-yard, in the presence of a considerable number of the resident gentry and inhabitants. The Mutine was laid down on the 30th October, 1843, and the Espiegle on the 7th February, and consequently has been built in the short space of ten weeks and two days. Each vessel is to have a complement of 130 men, including officers and marines, with the following armament:—Ten 32-pounders, six feet, 25 cwt., and two 18-pounders, six feet, 20 cwt. Both vessels have elliptic sterns, and are alike, excepting that the Mutine has four ports, and the Espiegle only two, which will give greater facility to the working of the guns.

Chester.—Four Chartists, named William Moorhouse, John Fairhurst, Robert Wild, and James Wild, were liberated from Knutsford House of Correction last week, about four months before the expiration of the term of their imprisonment. They were tried before Lord Abinger, at the Chester Assizes, 1842, on charges of sedition, &c., arising out of the part they took at various meetings near Hyde, during the great turn-out of factory operatives.

Durham.—The Cathedral of Durham has been thrown open to the public, without any payment being required from its numerous visitors, for seven hours a day during the summer months, and four during the winter, since July 1841; and not one case of mischief, or other misconduct connected with that indulgence, has come during the whole time to the knowledge of the Dean and Chapter.

Gloucester.—The annual meeting of the Hereford, Worcester, and Gloucester choirs, which should have been held this season at Gloucester, will not take place, owing to the impossibility of finding a sufficient number of gentlemen willing to make good all deficiencies by becoming stewards. This unfortunate position of matters is undisguisedly attributed to the effect of the hostile preaching of the Rev. Mr. Close, of Cheltenham, who has denounced the scripturalness of such pieces of music as are usually performed at music meetings being performed in places of worship; and, as the success of previous meetings was in a great degree owing to the support of the town of Cheltenham, and as the effect of Mr. Close's opinions was

unequivocally shown on the last occasion, the reluctance of individuals to encounter heavy and certain loss is not much to be wondered at. It is to be hoped that means will be adopted to secure to the charity the average revenue derived from such meetings.

Leicester.—The trial of John Britton, the horse-dealer, whose apprehension last September, at Walton, in this county, attracted some notice at the time, took place at the recent Somersetshire assizes. He was charged with having assaulted and robbed James Bartlett, as far back as August, 1826, at a fair at Priddy, near Wells, and several facts were adduced apparently forming strong evidence against the prisoner. Numerous witnesses, however, gave him an excellent character, and the Jury, considering the question of identity not clearly made out, returned a verdict of acquittal.

Liverpool.—The local papers state that at the conclusion of the present assizes, on Saturday week, Mr. Baron Rolfe, after sitting at Liverpool for nearly three weeks, observed to Mr. Wortley that it was almost more than human nature could endure to go through the labours of the northern circuit.

Oxford.—The contradictory reports that have been so long current on the subject of the disputed headship of Pembroke College are now set at rest by the acknowledgment of the validity of Dr. Jeune's election.—On Thursday the Rev. R. G. Macmullen read his first exercise for the degree of Bachelor of Divinity before the Regius Professor of Divinity and a numerous body of members of Convocation. The subject was—"The Church of England does not teach, nor can it be proved from Scripture, that any change takes place in the Elements of Consecration in the Lord's Supper." Mr. Macmullen's Exercise was rejected by the Regius Professor, as contrary to the doctrines of the Church of England on the Eucharist. On Saturday the candidate proceeded to read his second Exercise. The subject was—"It is a mode of expression calculated to give erroneous views of Divine Revelation, to speak of Scripture and Catholic Tradition as joint authorities in the matter of Christian doctrine." This Exercise was accepted by the Regius Professor.—The magistrates who committed Elliott for trial on suspicion of being concerned in the late coach robbery have been called upon to admit him to bail. Two London tradesmen offered themselves as his sureties, and were accepted.

Sunderland.—The local papers mention, as a sign of the times, that while the population of Sunderland is steadily on the increase, the consumption of animal food in that place is sensibly diminishing. The number of cattle, &c., now slaughtered for the town, is believed, on good evidence, to be less by 25 per cent. than in the year 1841. The conclusion is, that numbers of men, women, and children who formerly ate animal food now live upon potatoes.

Swindon.—The *Dorset Chronicle* states that a decision was given last week at the Swindon petty sessions, which is of some importance to agriculturists. Mr. Myers, of Langford, summoned Mary Hiles, keeper of the Westropgate, Highworth, for having demanded and taken 2*s.* for toll of a waggon laden with draining-tiles. Mr. Myers observed that draining-tiles, being used for the improvement of the land, were exempt from toll, and stated that the magistrates at Fairford the day before had so decided, having convicted the gatekeeper of the Lechlade-gate, whom he had summoned for taking toll for the same load of draining-tiles. Mr. Brace, of Highworth, who attended on behalf of the trustees, contended that draining-tiles were not exempt, not being named in the Act; and although draining had been practised for the improvement of the land for years previous to the passing of the Turnpike Act regulating the tolls, no mention was made of the materials used for such a purpose among those things enumerated as being exempt, viz.,—"implements in husbandry, or any dung, compost, or manure, employed in husbandry for manuring or improving land, or any other thing employed in the management of any farm or lands;" and he submitted that the latter sentence ought to read thus—"or any other thing (of a similar kind) employed," &c.; for to read it otherwise, the meaning would appear so general and indefinite that a farmer might put his account books relating to his farm into his gig, and claim exemption, as having a thing or things in his gig used in the management of his farm. The magistrates concurred in this opinion, and decided that draining-tiles were not legally exempt from toll; and consequently Mr. Myers had to pay the expenses.

Windsor.—A trotting match for 25*l.* a side came off on Monday between a light bay galloway, 13 hands, and a bay cob, 14 hands high. The parties to whom they belong reside in the neighbourhood of Dorset-square. The distance was from Regent's-Park to Windsor, 24 miles. The galloway was ridden by its owner, the cob was driven in a heavy gig. The match was won by the saddle horse, which completed the distance in 1 hour and 25 minutes, beating the one in harness by two minutes only. The winner was immediately taken back to town by railway, but the other died four hours after its arrival at Windsor, in the greatest tortures. The Society for Preventing Cruelty to Animals have taken steps for prosecuting all the parties.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1476*l.*; Birmingham and Gloucester, 2229*l.*; Eastern Counties, 4474*l.*; Edinburgh and Glasgow, 2209*l.*; Great Western, 15,624*l.*; Grand Junction, 7607*l.*; Glasgow, Paisley, and Ayr, 1334*l.*; Great North of England, 1518*l.*; London and Birmingham, 16,415*l.*; South-Western, 6677*l.*; Blackwall, 774*l.*; Greenwich, 2051*l.*; Brighton, 4721*l.*; Croydon, 264*l.*; Liverpool and Manchester, 4185*l.*; Manchester, Leeds, and Hull, associated, 6533*l.*; Midland Counties, 2625*l.*; Manchester and Birmingham, 3425*l.*; North Midland, 4429*l.*; Newcastle and Carlisle, 1300*l.*; South-Eastern and Dover, 3745*l.*; Sheffield and Manchester, 792*l.*; York and North Midland, 1694*l.*—Meetings were held last week at Derby and Birmingham for the purpose of considering the draft of a bill now before Parliament for consolidating the North Midland, Midland Counties, and Birmingham and Derby Junction Railways. The shareholders of the three companies were unanimously in favour of the amalgamation, and the draft of the Bill was therefore agreed to.—The London and Birmingham Company have directed their engineer, Mr. Stevenson, to make the necessary surveys on which to found an application to Parliament next session for a Bill to construct a line of railway communication to the district in which the towns of Warwick, Leamington, Rugby, and Oxford are situated, connecting it, by way of Banbury with Birmingham and the north of England, as well as with the south. The directors have also instructed Mr. Stevenson, with a view to the further extension of railway communication, to make surveys of the country preparatory to the formation of a line of railway from Oxford to the town of Aylesbury, from which latter town there is a branch line to the Birmingham Railway.—Exeter must now be considered a railway town, as a locomotive engine last week, for the first time, made its appearance within that city. On Wednesday the 17th, the first complete passage of an engine from the terminus at Beambridge to the new station at Exeter took place, the engine conveying Mr. Brunel, and several of the assistant engineers. The arrival of the engine was hailed with much interest by the Exonians, hundreds of whom were assembled to witness this novel visitor. In a few days this will become an ordinary sight, as no doubt is entertained that the public opening of the line will take place on the 1st of May; and there will then (with the exception of a slight break between Bristol and Gloucester, which will be completed in the course of a few weeks), be an unbroken railway communication from Exeter to Newcastle-on-Tyne, a distance of 300 miles.—The half-yearly meeting of the Preston and Wyre Company, held last week, showed more satisfactory results than were expected. It appears, taking the accounts of the year, that the increase of receipts of 1844 over 1843 amounted to 3847*l.* 0*s.* 7*d.*, while there has been a decrease in expenditure of 1738*l.* 8*s.* 11*d.* The progress of works in the neighbourhood of the undertaking, and the improvement of property, will, it seems, do much to increase the traffic of the line, independent of the revenue derived from the steam communication established between this and the Irish coast. The return of traffic the week previous to the holding of the meeting was 233*l.* against 143*l.* at the same period last year.

IRELAND.

THE STATE TRIALS.—On Saturday, shortly before the rising of the Court, the Attorney-General entered, and stated that in consequence of the affidavits filed by the traversers and their solicitors, he had thought it right to send copies of them to the Clerks of the Peace of the city of Dublin, and their deputy, Mr. Magrath. Those affidavits were connected with the charge of fraud in the construction of the jury-lists. They contained no specific charge against any individual; but, as the general charge of fraud was made against some person or persons unknown, and as the traversers and their solicitors denied that they are privy to that fraud, the Attorney-General thought it right to require that the only persons who could have committed that fraud should deny it on their oaths—that is, all persons in the office of the Clerk of the Peace who were cognizant of or connected with the formation of the jury-lists. The Attorney-General stated accordingly, that as no affidavit had yet been filed on behalf of any of these persons who had been served with notice to do so, he considered it but fair towards the traversers not to press on their motion on Monday, but to give them sufficient time to inspect those affidavits when filed. Under these circumstances, he should move that the order for Monday be discharged and allowed to stand generally. The moment the affidavits were filed the fact would be communicated to the traversers or their attorneys. Time should be given for their consideration; and, as it was expected they would be filed that evening, he supposed Mr. Whiteside would be able to bring on his motion on Tuesday. He wished however that the motion should be allowed to stand generally. The Court assented, and the order for Monday was discharged. On Monday the Court was crowded from an early hour both by the public and the members of the outer bar, from an expectation generally prevailing that some step would be taken during the day which would throw light on the mystery which has pervaded all parties as to the course about to be taken by the Crown in connection with the Attorney-General's application on Saturday evening for a postponement of the proceedings. The Clerks of the Peace were in attendance, and Mr. McGrath, the clerk in their office, in whose especial department was the preparation of the Special Jury list which has been such a prolific source of confusion throughout the proceedings. In the course of the morning Messrs. Archer and Dickenson, the Clerks of the Peace, were sworn by the officer of the Court to affidavits respecting the charge of mutilating the Jury list; and Mr. McGrath also swore a very voluminous affidavit, exculpating himself from any criminality in the transaction. The New trial motion commenced on Thursday.

Dublin.—Mr. Hugh Gray, one of Lord Fortescue's stipendiary magistrates, and who was reduced, but subsequently re appointed by the present Government, has had his name struck off the roll of stipendiary magistrates. This step has been taken on the ground that Mr. Gray induced, as it was alleged, and through the agency of one of his own policemen, a printer in Kilkenny to print a seditious ballad, in order to get up a prosecution. Mr. Gray, however, has appealed against the decision, and the subject is still under consideration. This case, it is said, is to be followed up by another Government inquiry into the police spy system in the King's county, where a police officer and some subordinates are charged with a conspiracy to get up Ribbon prosecutions. On Wednesday week, the Crown Solicitor made application to the magistrates at the Shinrone petty sessions, for the purpose of having summonses issued in order to investigate the charges, but the magistrate refused to sign the summonses in the absence of Sir W. Lyner and Colonel Lloyd, before whom the charges are said to have been originally preferred. Wednesday last was fixed for the commencement of the inquiry, and Sir W. Lyner, the stipendiary magistrate, who had been in Dublin, was directed to be in attendance.—The weekly meeting of the Repeal Association took place on Monday, Mr. Maher, M.P. for Tipperary, in the chair. Mr. O'Connell in handing in contributions from the Catholic clergy of Ballina and from Wexford said that on this occasion he would undertake the office of prophet—he would become the Pastorini of the Association—but without the bigotry of that celebrated personage. He had consulted the throbbing heart of Ireland; he knew its bravery, but he knew also its power of patient endurance; and his prophecy was this, that the prosecution will be replied to by doubling the funds, and proclaiming the undeviating fidelity of the people. Give him now but *eight* months of tranquillity, and he would certainly work out the regeneration of their country. With respect to the State prosecution, it was well known, he said, that its sole object was to put a stop to Repeal. Their prosecutors would make peace with them—with regard to *law* proceedings—in one hour, if they would agree to give up Repeal; but there must be no compromise—no half-measures. He would again tell all Ireland that peace and perseverance, and wearing the "Repeal button," would be the answer to the prosecution, and this line of conduct would be continued till Ireland became as she ought to be, "The first flower of the earth, and first gem of the sea." Mr. J. A. O'Neil then announced that he withdrew the notice of motion, touching the dissolution of the Association, which he had given at their last meeting, as he was now of opinion that such a motion was unnecessary. It was his opinion that the Association could never be put down by force or by threat, and he feared that the law of kindness, which might have that effect, would not be used towards it. He had no hope of such a thing. However, he added, we shall have the Queen amongst us this year, and she will open every prison door. Let the Repealers, then, encircle her Majesty, and show her, by their conduct, that they are worthy of having that domestic Legislature which they solicit. Mr. W. S. O'Brien read a long letter from Mr. O'Farrell, of Dungannon, which entered into a minute detail of some local disturbance between Orangemen and Repealers. On this Mr. O'Brien took occasion to exhort Repealers to be very forbearing towards Protestants, and to conciliate them as much as possible. He said it was absolutely necessary to have Protestants united with them in seeking Repeal. Protestants had many idle fears on the subject. They dreaded the reclamation of the forfeited estates; but this was an unfounded apprehension. The property which he (Mr. O'Brien) possessed was acquired by purchase, although he was of the pure, ancient Milesian blood. Would he then seek Repeal if it would be likely to endanger his estates? He looked to the time when Protestants would join them and fully adopt the principle which he proclaimed, namely, that the Queen, Lords, and Commons of Ireland alone have a moral right to legislate for the country. Mr. O'Connell declared that his two brothers had considerable property—every inch of which was "forfeited." With respect to himself, he was nearly in the same predicament—facts which ought to give courage to some timid persons. Mr. John Reynolds read the report of a committee on banking, complaining of the exclusive privileges of the Bank of Ireland: a revival of the agitation on this subject seemed to be determined upon. Counsellor Doheny next read the report of a committee on the municipal franchise. The rent for the week was 290*l.*

Law.

CENTRAL CRIMINAL COURT.—*The Will Forgeries.—The Sentence.*—On Monday morning the Judges, Mr. Baron Gurney, Mr. Justice Williams, and Mr. Justice Maule, having taken their seats upon the bench at the Central Criminal Court, Mr. Phinn rose and said that his client, William Sanders, had intimated to him his wish to retract his plea of "Not Guilty," and plead "Guilty" to the indictment against him in the case of Mary Hunt; and, after careful consideration of the evidence in the case, his learned friend Mr. Stone and himself had come to the determination that the result must be the same in effect if the trial should be proceeded with. He wished their Lordships would permit him to advert to the condition in life in which the prisoner moved, and to mention that he was a man of inferior education to the other prisoners, and that after a long course of misfortune, having been twice an insolvent, he had been led by men of superior judgment to commit the offence with which he was charged. The clerk of the arraigns then called upon the prisoner, and told him he was charged with inciting a certain evil-disposed person to forge a will purporting to be the last will and testament of Mary Hunt, and asked him whether he pleaded Guilty or Not Guilty. Sanders—I wish to plead Guilty. Mr. Wilkins said there were two other cases to be tried—the one just mentioned, and also another against Mr. Barber; and he could only say on the part of his client, Mr. Barber, that he was particularly anxious that those cases should be tried, and that he should, in reference to the case on which his client had been convicted, use every constitutional privilege which the law allowed him to render it nugatory, by appealing to the highest tribunals in the land. The learned gentleman expressed his conviction that the reason these trials were not to be proceeded with was that the prosecution did not dare to proceed. Mr. Erle said it would be improper now to advert to his convictions in reference to this case. Mr. Wilkins asked whether it was the intention of the learned counsel to allow an acquittal in regard to the other prisoners, or to enter a *nolle pro-*

Mr. Erle said, when he was called on to decide what course he intended to pursue, he should be ready to do so. Mr. Wilkins complained of an allusion to his client which Mr. Phinn had made. Mr. Phinn denied that he had in any way alluded to Mr. Wilkins's client. He had carefully abstained from doing so. Mr. Wilkins—His learned friend had spoken of his client having been tempted by persons of superior judgment. Mr. Justice Maule said the Court had not understood that any allusion had been made to Mr. Barber. The Judges then retired to consult on what course they should take, and after an absence of about a quarter of an hour, they returned into Court, upon which the clerk of arraigns, having called the prisoners severally by name, told them they had been convicted of felony, and asked them what they had to say why the sentence of the Court should not be passed upon them? Mr. Barber then proceeded to make a long speech to the Court, in order to show that he had been made the victim of Fletcher. He said he was aware that the question put to him implied whether he had any legal objection to make. He trusted, however, that their Lordships would not preclude him from making some observations on the general nature of the case upon which he had been convicted, more particularly as no witnesses were called for his defence. He did not mean by this to cast the least reflection on his counsel, to whom he could never be too grateful, and whose able defence would command his eternal gratitude. He wished to say, however, that at the conclusion of the Learned Gentleman's speech, had he (Mr. Barber) been asked whether he thought it necessary to have any witnesses called, he should have said he did not think it was. He had, however, very important evidence which he might have called. A system of deception had been practised against him by that man (pointing to Fletcher). Fletcher—No, no. Mr. Barber said he had never had any desire to increase Mr. Fletcher's difficulties, but the frightful circumstances in which he was placed were owing to Mr. Fletcher. All the misery he had suffered had been brought about by him, and was attributable to that confidence which he was induced to repose in Mr. Fletcher, whom he had not the least reason to suspect up to the present time. He hoped he should be able to satisfy their Lordships by something more than assertions of this kind. He then went on to say that he would explain the course which had been adopted towards him by Fletcher, in reference to Miss Slack's case. The correspondence had been already laid before their Lordships, but the most important feature in the history of this transaction he could not bring before their Lordships. It was this. Fletcher said it is likely that this young lady (Miss Slack) is entitled to this stock. He Barber had said he did not think there was much doubt of it, and thought it must be so. He said, however, there was a means by which he could decide the matter most completely, and that if he (Barber) could procure the handwriting, he would have it compared with the signature in the Bank book. He did so, and procured a letter with the signature of Miss Slack. Fletcher thereupon got it compared with the Bank books, as procured by Christmas. Respecting the answer which he got from Fletcher as to the result of that comparison, he had no means of verifying it; but Fletcher told him that the handwriting did not agree at all, and that his friend had compared it with the signature in the Bank books. He declared that the signature in the Bank books was that of an elderly person, while the signature of Miss Slack was that of a young lady, and that it was therefore quite certain that she was not the owner of the stock. He (Barber) then expressed his regret and surprise, but Fletcher said he was quite satisfied, and stated that the lady had executed a power of attorney before the dividends on the stock had ceased to be received. He entreated their Lordships to remember that Captain Foskett had said that Miss Slack was about 27 years of age; he admitted that in his evidence Fletcher upon this said it could not be the same party, as she would not have been competent to make a power of attorney at the period at which she had executed it, if she was only 27 years of age then. Coupling these facts together, he had come to the conclusion, firmly and honestly, that Miss Slack was not the same person as she in whose name the stock was invested, but that she was quite a different party. In a letter which he had written to Mr. Baxter (Captain Foskett's attorney), he (Barber) had promised that if the right party had been found out he would give him information of it, for the satisfaction of the young lady and the family. Now, when he wrote that letter he intended either to keep that promise or he did not. If he intended to keep it, it could not be argued that he had a guilty knowledge, and if he did not, he should not have made it, as it was perfectly unnecessary; but he did make it, and he intended to have kept it, and he did keep it. He did not, unfortunately, write a letter; but after this party (Emma Slack) had come forward, he met Mr. Baxter in Lincoln's Inn-fields, and informed him that the person who was really the owner had come forward and produced a will. Mr. Baxter said, "Ah, indeed!" and the correspondence between them then stopped; and that casual meeting was a great misfortune to him (Barber), for, had he not met Mr. Baxter, he should have written a letter, which would have been written in his books, and have been produced at the trial. He had said that Fletcher had deceived him in reference to the hand-writing, but he was not quite sure that Mr. Fletcher had not been deceived himself. It appeared from the evidence of Christmas that he gave rather a doubtful description of the signature; but whether he did or not, it certainly appeared he stated that Miss Slack, of Abbott's Langley, was not the owner of the stock. Mr. Fletcher produced to him (Barber) an extract from a letter, and said he had received it from a friend at the Bank. He (Barber) never knew who that friend was till after this prosecution had been commenced. He spoke of him simply as a friend at the Bank. The extract from the letter alluded to stated that there was stock in the Bank standing in the name of Miss Slack, formerly of Smith-street, Chelsea, now of Abbott's Langley, but that was not the same person. During this time he attended a case at the Croydon assizes, during which his partner, Mr. Bircham, attended to Mr. Fletcher's business in this case. [Barber then produced the extract from the letter, and, turning to Mr. Fletcher, said, "You will admit this is in your handwriting." Fletcher admitted it was.] Their Lordships would see how important this was. There were two circumstances by which he arrived at a certain conviction that Miss Slack was not the owner of the property—one that the handwriting was different, and the other that she could not have executed the power of attorney, which it appeared she had, on account of her age. He had said to Captain Foskett, in one of the conversations, that 40 years of age would do. The prosecution appeared to think that was against him, but see how that told in his favour. Forty years would do; that was to say, it was consistent with other circumstances; and was it not most extraordinary that Captain Foskett, who had married the lady's sister, should have stated that her age was 27, when in fact it was 37. After some further observations, in which there was considerable repetition, he declared, over and over, that he was misled by Fletcher; that he had been Fletcher's victim. He then appealed to the life of industry and respectability which he had led from boyhood to the present time, and concluded by calling on Fletcher, as he hoped to enjoy some peaceful moments in his later life, to declare that he (Barber) had been the victim of his (Fletcher's) deception, and begging of the Court to extend its mercy to him.—Mr. Fletcher on being called on threw the onus upon Christmas, and said that if Mr. Barber had been deceived, he had himself been made the dupe of others who were more designing than he was. He had been long affected with disease of the heart. He did not believe he could live many years, and he implored the mercy of the Court.—William Sanders said that he had been made an instrument in the hands of others, and as he had made every reparation in his power for what he had done, he trusted the Court would deal mercifully with him.—The two female prisoners said nothing.—Mr. Baron Gurney then proceeded to pass sentence on the prisoners. Addressing Fletcher first he said—that he had been found guilty upon two indictments of the crime of felony—that a few years ago he would have expiated with his life the crime of which he had been found guilty—that his crime was aggravated from the respectable position he occupied in society. He then sentenced him to transportation for life. With regard to Mr. Barber, he said that he had been found guilty as an accessory before the fact, after a patient and long trial. The Learned Judge who tried him had acquiesced in the finding of the Jury, and his opinion was not altered after the statement which the prisoner had made. His crime was also very much aggravated from the fact of his being a respectable attorney, and the sentence of the Court was, that he be transported beyond the seas for the term of his natural life. With regard to William Sanders, the Court distinguished his guilt from that of the others, and believing him to have been misled, the sentence of the Court was, that he be transported for 7 years. With respect to the two female prisoners, as they had been instruments in the hands of others, and as one of them (Mrs. Dorey), had made all the atonement in her power, by making a confession which furthered the ends of justice, the sentence of the Court upon them was, that they be kept in confinement for 2 years. The prisoner Fletcher sunk into his seat when sentence had been pronounced. Barber seemed deeply affected at first, but soon recovered his usual calm manner, and the female prisoners were both in tears. It is stated that since the conviction of the prisoners some important disclosures have been made, and it is expected that Fletcher will now make a full disclosure of the whole facts, by which, it is stated, that another celebrated firm will be implicated.

William Brown, gardener, was indicted for feloniously receiving two books and a number of knives and forks, the property of the Rev. J. Singleton. It was proved that the property was found in the house of the prisoner; but the evidence failed to show that he received it with a guilty knowledge, and he was accordingly Acquitted. The prisoner was next indicted for receiving, knowing them to have been stolen, several articles of property belonging to Mr. Thomas Scott, of Wendon, in Essex. From the evidence in this case it appeared that on the night of the 25th January last the house of the prosecutor had been broken into and a great variety of property stolen. A part of the goods carried away had been found on the premises of the prisoner; and at the late assizes at Chelmsford, Matthew Hall Cuttriss and John Bennet had been found guilty of the burglary, and sentenced to transportation for life. The goods produced were clearly identified, and the prisoner was found Guilty. A police sergeant was then called into the witness-box, and stated that he had frequently seen the prisoner in company of convicted thieves, and had so strong a suspicion of his honesty that he kept a close eye upon him. The prisoner was sentenced to ten years' transportation.—*The Lady Shoplifters.—Ann Elizabeth Earnshaw*, aged 34, married, and *Emma Wells*, aged 28, spinster, were indicted for stealing a silver knife, value 6*s.* 6*d.*, the property of Mary Ann Rose. From the evidence it appeared, that on the 17th February last, the prisoners entered the shop of the prosecutrix in Farringdon-street, and asked to see some silver fruit knives. They left without purchasing any, and immediately afterwards the prosecutrix missed one. She sent her boy after the prisoners, and he saw them enter a pawnbroker's shop. He gave them into custody, and on being searched at the station-house a knife was found concealed about the person of Wells, which the prosecutrix identified as one of those which she had shown to the prisoners, though it was not the one she had missed. Mr. Clarkson addressed the jury for the defence, and having urged that Mrs. Rose could not be positive that her shopman had not sold the knife on some previous occasion, contended that Mrs. Earnshaw was not implicated in the transaction, the possession not having been traced to her in any manner. Several witnesses gave a character for high respectability to the prisoners, who had lived in respectable lodgings at Camden-town. Mrs. Earnshaw was possessed of a considerable income, and Miss Wells lived with her as a companion. The Recorder summed up the evidence, and the jury after a short consultation returned a verdict of Guilty against Wells, acquitting Earnshaw. They begged to add a strong recommendation to mercy on behalf of Wells. The Recorder advised them to wait. The prisoners were again indicted for stealing two diamond rings, value 3*l.* 7*s.* 6*d.*, the property of Thomas Clapham. The evidence was of a similar description. The prisoners went together to the shop of the prosecutor in the Strand, and asked to be shown some rings. They left without purchasing, and the rings were not missed until a constable showed them to the prosecutor, they having been found in the writing-desk of Miss Wells. For the same reason as in the former case, namely, the want of proof of possession, as regarded Earnshaw, the jury again acquitted her, and found Wells guilty. The prisoners were then indicted for stealing a gold watch, value 30*l.*, the property of John Smith. It appeared that the prisoners had gone to Mr. Smith's shop, in the Strand, about the middle of February, and asked to be shown some watches. They complained of the prices of those in the first tray, and wished to see some about 6*l.* They left without purchasing, and the watch was not missed until a constable applied to the shopman, and showed him a watch which Miss Wells had handed to the constable in charge of the station-house, saying it was hers, and desiring that it should be taken care of. The shopman at once recognised it as one of those which he had shown to the prisoners, and on referring to the tray, its place was found vacant. The value of the watch was 30*l.* The Recorder summed up, and directed the attention of the jury to the facts and circumstances attending these cases. The parties, always together, occupying the same sitting and bedroom; Wells, the poorer, having no means of purchasing an expensive watch, and the impossibility of her possession of it being unknown to the other prisoner. The jury, after a long consultation, returned a verdict of guilty against both prisoners. They were again indicted for stealing a gold locket, value 20*s.*, the property of George Lamb. The evidence was similar to that in the other cases. The prisoners had pledged the locket with the pawnbroker into whose shop Mrs. Rose's boy had traced them. The jury at once returned a verdict of Guilty against both prisoners. The Recorder addressed them, and said that the apparent respectability of the elder prisoner had prevailed in the first tried cases, but on further investigation it appeared that she was not only an accomplice of the other, but even worse, for she not only confederated with her, but threw the chances of conviction far more upon her than she was liable to herself. It was melancholy to see persons committing such crimes, unactuated by the motive of distress, which was so frequently urged in mitigation of similar offences, when committed by persons in an humbler sphere of life. The Court, in the performance of its duty, should hold the scales of justice even, and if circumstances could be shown calculated so render a more lenient sentence than that about to be passed upon them sufficient, they should be laid before the proper authorities. The sentence of the Court was, that they be severally transported for the term of seven years. Wells fainted on turning from the bar. The other prisoner was removed crying bitterly.

SPORTING.

NEWMARKET FIRST SPRING MEETING.

MONDAY.—50*l. for four yr-olds*, 7 st 10 lbs; five, 8 st 9 lbs; six and aged 9 st. Last three miles of B.C. Lord Albemarle's The Brewer, 4 yrs, beat by a length Mr. Watson's Antidote, 4 yrs; Lord Exeter's Czar, 4 yrs; and Mr. Roger's Prosody, 5 yrs.—*Sweepstakes*, of 100 sovs each, for colts, 8 st 9 lbs, and fillies, 8 st 5 lbs. R.M. (4 subs.) Lord Glasgow's c by Velocipede; and Duke of Beaufort's Claude Frollo; had a dead heat at first, after which the colt broke down, and Claude Frollo walked over.—*Sweepstakes*, of 100 sovs, h ft, for fillies, 8 st 7 lbs each. D.M. (5 subs.) Lord Exeter's Merope, beat by a head Mr. Thornhill's Example, and Lord Glasgow's f, by M. Moloch.—*Sweepstakes*, of 100 sovs each, h ft, for four-yr-olds. A.F. (4 subs.) Duke of Bedford's Minotaur, 7 st, beat by a length Duke of Grafton's Æsop, 6 st 4 lbs, and Lord Exeter's Fraulein, 6 st 11 lbs.—*The Palace Fily Stakes*, of 100 sovs each for three-yr-olds, 8 st 7 lbs each. D.M. (6 subs.) Duke of Rutland's Crenoline, beat by a neck Lord Stradbroke's Boarding School Miss; Lord Albemarle's Robinia; and Lord Exeter's Economy.—*Sweepstakes*, of 50 sovs each, for foals of 1841; colts 8 st 7 lbs, and fillies 8 st 3 lbs. A.F. (9 subs.) Mr. Phillimore's Skeleton, allowed 3 lbs, beat by 2 lengths Mr. Combe's Keeley; Lord Orford's c by Elis, out of Miss Julia; Lord G. Bentinck's The Great Mogul; and Lord W. Powlett's Falconer. *Match.*—300*l.* T.Y.C.—Duke of Bedford's Oakley, 8 st 7 lbs, beat Lord G. Bentinck's Emma, 5 st 5½ lbs, by a length in a canter. *Match.*—First half of Ab. M.; 150, h ft, Mr. Greville's Molly Mogg, 3 yrs, 8 st 7 lbs; and Lord Glasgow's f, by Bay Middleton, 6 st 7 lbs. A dead heat.

TUESDAY.—*The 2000 Guinea Stakes* of 100 sovs each, h ft, for three-yr-old colts, 8 st 7 lbs; fillies, 8 st 4 lbs. R.M. 25 subs. Mr. J. Day's The Ugly Buck, by Venison J. Day, jun.), beat by a neck Lord G. Bentinck's The Devil-to-Pay; Colonel Anson's Joe Lovell; Mr. Wreford's c by Camel, out of Wadrasta; Lord Exeter's Algernon, by Beiram; Mr. Thornhill's Elemi; and Mr. Maffam's Dr. Phillimore.—*The Queen's Plate*, of 100 guineas; for mares, 4 yrs, 8 st 9 lbs; 5 yrs, 9 st 8 lbs; 6 yrs and aged, 10 st. R.C. Lord Exeter's Wee Pet, by Sheet Anchor, 4 yrs, beat by 4 lengths Mr. Roger's Sister to Coranna; and Mr. Newton's Jenny Jumps.—*The Coffee-Room Stakes*, of 10 sovs each; colts, 8 st 7 lbs; fillies, 8 st 4 lbs. The produce of mares that never produced a winner. A.F. 7 subscribers. Duke of Richmond's Red Deer, by Venison, beat by a length Mr. Watt's Voltri; Lord Exeter's Mocha; and Lord Exeter's Crosby.—*Sweepstakes* of 300 sovs each, 100 ft; for four-yr-old colts, 8 st 7 lbs; and fillies, 8 st 2 lbs. B.C. 7 subs. Duke of Bedford's Minotaur by Taurus, beat Lord Chesterfield's New Brighton, by four lengths.—*Match*, 8 st 7 lbs each. R.M. 200 h ft. Mr. Greville's Jamaica, beat Lord Exeter's Economy, by half a length.—*Match.* T.Y.C. 100 sovs. Mr. Payne's Audrey, 7 st 13 lbs, beat Mr. Osbaldeston's Escrick, 8 st 7 lbs, by a head.

WEDNESDAY.—50*l. for four-yr-olds*, 7 st 8 lbs.; five, 8 st 11 lbs; six and aged, 9 st 3 lbs. B.C. Mr. Watson's Antidote, 4 yrs, beat by three lengths Lord Exeter's Maria Diaz, 4 yrs.—*Sweepstakes*, of 50 sovs each, h ft. T.M.M. (5 subs.) Duke of Rutland's Hyrcanian, 4 yrs, 6 st 7 lbs, beat by a length Col. Peel's I-am-not-aware, aged, 6 st 12 lbs; and Lord Chesterfield's Barbarina, 4 yrs, 5 st 4 lbs. *Match*, T.Y.C., 200, h ft.—Duke of Bedford's Oakley, 8 st 7 lbs, beat Lord Exeter's Pergularia, 4 st 7 lbs, by a length.

THURSDAY.—*Sweepstakes* of 10 sovs. each, for three-year-old colts, 8 st 7 lb, and fillies 8 st 4 lb; first half of Ab. M. Winner to be sold for 80*l.*, &c. (5 subs.) Lord Exeter's Mocha beat by a length Mr. Greville's Molly Mogg, General Yates's Sister to Pompey, Duke of Bedford's Commerce, and Mr. Osbaldeston's c. by The Saddler.—*The One Thousand Guineas Stakes*, by subs, of 100 sovs. each, h. ft., for three-year-old fillies, 8 st 7 lbs each, D.M. (26 subs.) Mr. Osbaldeston's f sister to Martingale beat by 2 lengths, Lord Exeter's Merope by Voltaire, Baron Rothschild's Emerald, by Defence, and 6 others.—*The Eglinton Stakes*, of 100 sovs. each, h. ft., for colts 8 st 7 lbs, and fillies, 8 st 2 lbs. T.Y.C. (8 subs.) Lord Maidstone's Cockamaroo beat by a head Mr. Thornhill's Elemi and Duke of Bedford's Panther.—*The Queen's Plate*, of 100 guineas, for four-year-olds, 9 st 8 lbs; five, 10 st 7 lbs; six and aged, 10 st 12 lbs. R.C. Mr. Boyce's Corranna, 5 yrs, beat Lord Exeter's Czar, 4 yrs. OAKS.—*Match.*—Duke of Bedford's Espoir, 9 st 7 lbs, beat Lord Glasgow's f, by Bay Middleton, out of Impertinence, 7 st; first half of Ab. M., 200, h. ft., in a canter.—*Match.*—First half of Ab. M., 100, h. ft. Duke of Bedford's Espoir, 8 st 7 lbs, beat Mr. Osbaldeston's Escrick, 7 st 7 lbs, by half a length.—*Match.*—A. F. 200, h. ft., 8 st 7 lbs each. Lord Albemarle's Winfarthing, by Liverpool, received from Lord Exeter's Plush, by Economist.

BIRTHS.—On the 4th inst., Mrs. M. HODDER, of Hoddersfield, of a daughter—8th inst., the lady of Capt. BATTLEY, of the 64th Regiment, of a son—8th inst., at Margate, the wife of WILLM. BROOKE, Esq, of a son—15th inst., at Canterbury, the wife of Lieutenant-Colonel HANKEY, King's Dragoon Guards, of a still-born son—17th inst., at 17, Broad-street buildings, Mrs. G. DOWSE, of a son—18th inst., at Grange-court, Chigwell, Mrs. W. W. MAITLAND, of a son—19th inst., at 25, Euston-square, the lady of W. THACKER, Esq., of a son—19th inst., at Hammersmith, Mrs. J. P. THOM, of a son—21st inst., at Bath, the lady of Sir C. SHAW, of a son, who survived but a short time—21st inst., at Gloucester-road, Regent's Park, Mrs. R. J. S. TODD, of a son—21st inst., at Earlswood-lodge, near Reigate, the lady of Major E. P. LYNCH, K.L.S., of a daughter—21st inst., at Upper Tooting, Mrs. R. JOHNSON, of a son—21st inst., Mrs. CURLING, Albion-road, Stoke Newington, of a daughter—22d inst., at Clapham, the wife of H. H. DEACON, Esq., of a daughter—22d inst., at Hampstead, the lady of D. S. BOCKETT, Esq., of a daughter.

MARRIED.—On the 28th March, at Naples, Lieutenant-Col. C. HAY, commanding the 19th Regiment, fourth son of the late General Sir James Hay, K.C.H., to ELLEN ASHWORTH, second daughter of the late Major General Sir Charles Ashworth, K.C.B., K.T.S.—17th inst., before the civil authorities, and afterwards at the Episcopal Church, Rotterdam, R. J. DOBREE, Esq., to ELIZ. E. WACHTER, eldest daughter of J. P. Wachter, Esq.—23d inst., at Eccleston, near Chester, the Rev. W. MOXON MANN, B.A., British Chaplain at Coblenz, on the Rhine, to CLARA CARPENTER, youngest daughter of D. T. Carpenter, of Hawkehouse, Sunbury, Esq., Captain in the 61st Regiment of Foot, and niece of Lord Stanley, of Alderley, and the Lord Bishop of Norwich—23d inst., the Rev. H. THOMPSON, B.A., late of Magdalen-hall, Oxford, to JULIA E. YEA, youngest daughter of Sir William Walter Yea, Bart., of Pyrland-hall, in the county of Somerset

DIED.—On the 31st of January, 1844, of cholera, on board her Majesty's ship Hydra, off the coast of Africa, JOHN THOMAS, Esq., eldest son of the late Colonel Thomas, of the 28th Regiment, aged 45, her Majesty's Commissioner at St. Paulo de Loando for the Abolition of the Slave Trade, under the Portuguese Treaty. He was a Deputy-Lieutenant, and for several years a most active and useful magistrate of the county and city of Worcester—11th inst., SOPHIA WINTLE, the wife of Mr. Jacob Wintle, of No. 11, Roupell-street, silversmith, aged 37—12th inst., Mrs. E. HAMMOND, of Walham-green, aged 80—13th inst., at Hanover-buildings, Southampton, Mrs. M. BOOTH, aged 76—15th inst., after a long and painful illness, C. MAGNAY, Esq., of South Shields—15th inst., Mrs. A. WHITE, of Parliament-street, Westminster—15th inst., at her residence, 35, Russell-square, Brighton, Miss C. NORTON, of Clayton Wickham, Sussex, only daughter of the late J. B. Norton, Esq., aged 78—15th inst., CAROLINE M. HANKEY, wife of Lieutenant-Colonel Hankey, King's Dragoon Guards, and daughter of A. W. Roberts, Esq.—16th inst., at Leamington, GEORGINA M. TRYON, youngest daughter of the late Lieutenant-Colonel Tryon—16th inst., at Kingston-hill, MARIA SMITH, wife of G. S. Smith, Esq., aged 26—16th inst., at his mother's residence, Upper Clapton, JAS. C. WOODFORDE, eldest son of the late J. Woodforde, Esq., formerly of his Majesty's Exchequer—17th inst., at 10, Grosvenor-street West, Sir T. TURTON, Bart., of Felcourt, Surrey, aged 80—18th inst., at Dankeith, in the county of Ayr, Lieutenant-Colonel WM. KELSO, of Dankeith, late of the Hon. East India Company's Service—19th inst., at his residence, Lansdown-place East, Bath, the Rev. J. HUNTER, A.M., youngest son of the late J. Hunter, Esq., of Upper Holloway, Middlesex, aged 48—20th inst., in Park-street, Grosvenor-square, Miss ANNE C. PACK, only sister of the late Major-General Sir Denis Pack, K.C.B., aged 76—20th inst., at Wigan, HERBERT G. REES, elder son of W. Rees, Esq., aged 4 years and 10 months—21st inst., at Canterbury, MARTHA SANKEY, wife of W. H. O. Sankey, Esq., late of Margate—21st inst., at Cheapside, after a short but severe illness, Mr. M. DUNNETT, aged 42—21st inst., J. SMITH, Esq., of the Grange-road, Bermondsey, aged 63—23d inst., the Hon. HUGH LINDSAY, one of the East India Directors—21st, at Leamington, Vice-Admiral SIR JAHLEEL BRENTON, Deputy Lieut.-Governor of Greenwich Hospital.

YORKSHIRE LAND-DRAINING ASSOCIATION

Capital, 500,000*l.*, in stock of 25*l.*—Deposit, 5 per cent.

PATRONS.—The Right Hon. Lord Beaumont.
The Right Hon. Lord Viscount Morpeth.
Sir William M. Milner, Bart.
Edward Stillingfleet Cayley, Esq., M.P.

PROVISIONAL COMMITTEE.

Mr. James Andrew, Kirkham Cottage, Wakefield.
Mr. Caleb Angus, Neswick, Driffield.
J. Barkenridge, Esq., Bretton, Wakefield.
Thomas Bradley, Esq., Richmond.
Christopher Bradley, Esq., Richmond.
Henry Briggs, Esq., Overton, Wakefield.
Mr. George Baker, Roundhay-road, Leeds.
Joseph Dent, Esq., Ribstone-park, Wetherby.
J. Bailey Denton, Esq., 9, Gray's-inn-square, London.
John Grey, Esq., Dilston.
Mr. Edwin Green, Havercroft, Barnsley.
James Hall, Esq., Scorborough, Beverley.
James Hammerton, Esq., Hellifield Peel, Skipton.
J. Mildred Hustler, Esq., Bradford.
R. M. Jaques, Esq., Easby Abbey, Richmond.
James Smith, Esq. (Deanston), 13, Queen-sq., Westminster.
Mr. William Tuke, Bradford.

With power to add to their number.

BANKERS.—The York City and County Banking Company.
STANDING COUNSEL.—H. Bellenden Ker, Esq., Lincoln's-inn.
DRAINING ENGINEER.—James Smith, Esq. (Deanston.)
SOLICITORS.—Messrs. Blanchard, Richardson, and Gutch, York.
SECRETARY.—John H. Charnock, Esq., Wakefield.

This Association is formed for the purpose of affording to the Agricultural Interest, by means of its collective capital, the funds necessary for the THOROUGH DRAINING OF LAND; and of executing and superintending the execution of the works required for this purpose on the most economical and effective principles—repayment of the money advanced to be made, with interest, by such equitable half-yearly instalments as in the several cases may be determined.

Among the various objects to which of late years collective capital has been more or less successfully applied, it is not a little surprising that the one which, of all others, offers the most certain and profitable return, with the soundest security, should have hitherto been almost disregarded. The time, however, has arrived, when an urgent desire for Agricultural improvement on the one hand, and a dearth of safe and profitable investment for superabundant capital on the other, renders such an Association highly desirable to both the landed and monied interest, whilst to the community generally an almost incalculable advantage will be secured by a proportionate increase of labour and food.

At a meeting of the council of the Yorkshire Agricultural Society, held in York, on the 20th of December, 1843, a resolution was passed, approving generally of the objects of this Association, and at the monthly meeting of the Wakefield Farmers' Club held on the 5th January, 1844, a resolution approving of the principle and objects of the Association, was unanimously adopted.

At the meeting of the Royal Agricultural Society of England, at Liverpool, in July, 1841, Lord Stanley remarked—that "there was no bank in the whole country—no commercial speculation—no investment so safe, so sure and profitable, as that in which even borowed capital may be engaged, by investing it under the ground of your own soil." And in reference to this Association, his Lordship, in a letter to the Committee says:—"I am fully satisfied of the benefits which such an Association is capable of conferring on the country, if confined to its legitimate object—the lending of capital on the security of an investment in draining; and I think it very probable that many landed proprietors would avail themselves of the facilities afforded by an institution lending money on land, repayable by instalments—a condition on which few private parties are willing to lend.

Bearing in mind the important objects of the Association, and the perfect security with which its operations can be conducted, at a comparatively trifling expense (no large expenditure for previous outfit being required), it may be reasonably expected that the return for the capital embarked will be such as to insure the support of prudent and permanent investors, thereby divesting it of that speculative character which has stigmatised so many modern projects, and which it is the especial desire of the Committee to avoid.

Application for prospectuses, and further particulars to be addressed to the Solicitors, Messrs. BLANCHARD, RICHARDSON, and GUTCH, York; or to J. H. CHARNOCK, ESQ., the Secretary, Wakefield.

WM. JOHN CORMACK, AGRICULTURAL SEEDSMAN by Appointment to His Royal Highness PRINCE ALBERT, New Cross, Surrey, and Bedford Conservatory, Covent Garden, begs to call the attention of the Nobility, Gentry, and Agriculturists in general to his combinations of GRASS SEEDS for Permanent Pasture, the Alternate Husbandry, Parks, Lawns, &c. (as recommended and practised by his partner, the late Mr. GEORGE SINCLAIR, Author of the "Hortus Gramineus Woburnensis.") Upwards of 25,000 acres have been converted to permanent pasture by this establishment with the greatest success. Parties requiring Seeds are respectfully requested to state the nature of the soils. Mangold Wurzel, Carrot, and Turnip-seed of excellent sorts, saved from transplanted bulbs. Garden and Agricultural Seeds of the best quality and most approved kinds.

N.B.—Cormack's British Queen and Prince Albert Peas, at 3*s.* 6*d.* per quart.

THE NEW CHEMICAL MANURE.

HUMPHREYS'S FARMERS' COMPOUND.—Stronger than guano, and without its scorching effects, highly efficient with Wheat, Barley, Hops, Turnips, Potatoes, &c. The strength renders this a cheap manure, as two-thirds are equal to three of guano or of any other fertilizing agent. Unrivalled for garden culture. Price 12*s.* per cwt.—DAVY MACKMURDO and Co., 100, Upper Thames-street, London; Factory, Great George-street, Bermondsey.

CHOICE FLOWERS and PLANTS, in POTS.—HUMPHREYS'S INODOROUS SOLUBLE COMPOUND. Fertilizing Agents of great power are here combined in a highly-condensed form, so that a few grains of the powder dissolved once a week, or once a fortnight, in the water used with plants, are sufficient to produce a vigorous growth and splendid flowers. Highly effective with Geraniums, Cacti, Pansies, Pelargoniums, Heaths, Verbenas, Carnations, &c. See *Gardeners' Chronicle*, &c.—Sold in Bottles, 1*s.* 9*d.* each, by the leading Seedsmen in town and country. Wholesale Agents: DAVY, MACKMURDO, and Co., 100, Upper Thames-street, London.

KEENE'S PATENT MARBLE CEMENT.—This CEMENT is particularly adapted for the Walls and Floors of Conservatories and Greenhouses, being calculated, from its extreme hardness, to resist the wear incident to ordinary Plastering. For Floors it has a threefold advantage over Stone-paving. 1st, in its lightness; one inch in thickness of KEENE'S CEMENT sufficing where 2 to 3 inch flagging would be employed. Next, in its appearance, combining, as it does, the hardness of stone with a uniform colour and even surface free from joints; and lastly, in economy, being one-third the price of Portland paving.

The most conclusive evidence can be given of the utility of KEENE'S CEMENT for these purposes by the Patentees and Manufacturers.—JOHN BAZLEY WHITE and Sons, Millbank-street, Westminster.

GARDEN ENGINE for SALE, CHEAP.—An excellent and powerful Garden Engine, in capital order; will contain 16 gallons. Price 3*l.* (cost 5*l.*)—May be seen at 12, Halton-street, Cross-street, Islington.

MOST IMPORTANT TO FARMERS AND GRAZIERS.

GIBBONS' DISINFECTING OINTMENT, a most effectual and perfect cure for Epidemic and Foot-rot in Sheep; also for Epidemic and Foul in Cows' Feet, and for the Grease and Thrush in Horses; prepared only by HENRY GIBBONS, Agricultural Chemist, Wolverhampton.

This Ointment effectually destroys the American grub on Fruit-trees. Sold by all respectable Druggists in Town and Country, in packets at 2*s.* 6*d.* each. Mr. William Bailey, Manufacturing Chemist, North Street, Wolverhampton, is appointed Sole Wholesale and Shipping Agent.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	
Garden Edging	Orange Tubs, Flower Boxes, &c

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

HENRY HUNT'S PATENT GARDEN-POTS and STANDS, for effecting improved Drainage and Draught of Air. Patronised by Royalty and 30 Metropolitan and Provincial Horticultural Societies. Wholesale and Retail Depôt, 29, Queen's-row, Pimlico. The opinions of the Horticultural and Scientific Press, with priced Cards, forwarded on application, post-paid. Nurserymen in provincial towns appointed Agents.

THE HAIR.—Of the numerous compounds constantly announced for promoting the growth or reproduction of the Hair, few survive, even in name, beyond a very limited period; whilst ROWLAND'S MACASSAR OIL, with a reputation unparalleled, is still on the increase in public estimation. The singular virtues of this successful invention for *restoring*, *preserving* and *beautifying* the *Human Hair*, are too well known and appreciated to need comment. The very facts of the high and distinguished patronage it enjoys, its general use in all countries, together with numerous testimonials constantly received in its favour, are authorities which stamp its superior excellence and title over all attempts of a similar nature. Being universally preferred, its consequent great demand excites the cupidity of unprincipled Shopkeepers, who vend the most spurious trash as the "GENUINE" *Macassar Oil;* whereas the genuine article is wholly the invention and property of A. ROWLAND and SON, and the amalgamation of its *costly exotic* materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "*Macassar Oil.*" The genuine article has the words ROWLAND'S MACASSAR OIL on the wrapper.—All others are FRAUDULENT COUNTERFEITS!!!

TWENTY YEARS' LOSS of HAIR, and WONDERFUL RESTORATION. Church-street, Whitby, Oct. 19, 1844.——Gentlemen,—Of the last supply of OLDRIDGE'S BALM OF COLUMBIA every bottle was sold immediately on receipt, and I have many more bespoke, only waiting for a further supply, which I hope you will send without the least delay. Orders have poured in more than ever since the powerful effects of the Balm have been so decisively demonstrated in the cases of several credible and respectable inhabitants of the town. One instance, among others which have attracted particular attention, is the case of a gentleman who had had little or no hair for 20 years; he had tried numerous preparations in vain, and ultimately had his head shaved, and wore a wig. At my recommendation he tried the Balm; and after using it according to the directions for a short time, the young hair appeared, and he has now as fine a head of hair as any person in Whitby. Yours, &c., JOHN KILVINTON.—To Messrs. Kennaby, Brothers, 10, Westmoreland-buildings, Aldersgate-street, London.

OLDRIDGE'S BALM prevents the hair turning gray, produces a beautiful curl, frees it from scurf, and stops it from falling off; a few Bottles generally restore it again. Price 3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle. *No other prices are genuine.* Ask for OLDRIDGE'S, BALM of COLUMBIA, 1, Wellington-street, Strand.

BEE-HIVES.—GEORGE NEIGHBOUR & SON beg to inform their Apiarian friends that they have prepared for the season a large supply of "Nutt's Patent Bee-hives" (for the sale of which they are the only authorised agents), in which are embodied all the recent improvements. Their selection now comprehends most varieties in general use at the present time, including the "Single Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with glasses, &c., from either of which the produce may be taken at any time of the gathering season, without destroying the Bees.

G. N. & SON have also Glass Hives, and other articles connected with Bee management, a catalogue of which, with drawings, may be obtained. Letters of inquiry must have postage stamps inclosed.—Apiarian Depot and Honey Warehouse, 127, High Holborn, London.

NUTT ON BEES, Fifth Edition, now Published.

NEW GARDEN NET, 1½*d.* per yard, second-hand do., ¾*d.* per yard, quite perfect; Garden Net, ¾ inch mesh, warranted to protect the blossom, 2½*d.* per yard; a fibrous Hemp Net, New Hemp Net, 36 meshes to an inch, 7½*d.* per yard; Worsted and Woollen Nets, Net to fence out Hares and Rabbits, 2*d.* per yard, tarred; Tarpauling Frame Pit and Greenhouse Covers, 1*s.* per square yard; Long Hare and Rabbit Nets on Cords, 50, 80, and 100 yards long. Upwards of 1000 London Policemen's Capes, 2*s.* and 2*s.* 6*d.* each, for Labourers, Gardeners, and Farm-servants. Flags, Banners, &c.

TO FARMERS.—Sheep Net nearly 4 feet high, 4½*d.* per yard, of strong cord; Rick Cloths dressed with a pliable composition of Tar and boiled Oil, which never mildew or are touched by vermin, as follows:—for 30 tons of Hay, 30 feet by 30 feet, 5*l.*; 40 tons, 36 feet by 30 feet, 6*l.* 10*s.*; 50 tons, 36 feet by 36 feet, 7*l.* 10*s.* complete with side-lines. Early orders are respectfully solicited for these Rick-cloths, to prevent disappointment. Dressed Wagon and Hay Cart Cloths. Expanding Tents (the only maker) for Lawns, &c., 36 feet round, 6 feet high in the lowest part, 5*l.*; 42 feet round, 6*l.* 10*s.*; 24 feet round, 4*l.*, put up or down in a few minutes, and require no side-lines. Fishing-Nets of all kinds. Nets to cover in Pheasants, Poultry, &c., 2*d.* per yard. Nets made to order. ROBERT RICHARDSON, Net, Tent, and Rick Cloth Maker, 21, Tonbridge-place, New-road, corner of Judd-street, London.

DRESS AND FROCK COATS.

DRESS COATS, Superfine Cloth, 27*s.*; extra quality, 35*s.* and 40*s.*; Imperial Saxony, 50*s.*; Frock Coats, Silk Facings, 30*s.* to 40*s.*, extra quality, Silk Velvet Collar, and Silk facings, 48*s.*; Saxony ditto, 55*s.*; Children's Silk Tunic and Hussar Suits, 30*s.*; Waistcoats, new patterns, 5*s.* 6*d.* to 10*s.* 6*d.*; Trousers, 6*s.* 6*d.* to 10*s.* 6*d.*; excellent Doeskin, 12*s.* to 16*s.*; Summer Coats, 6*s.* 6*d.* to 10*s.* 6*d.*; Chesterfield Over Coats, with Silk Collars and Cuffs, 18*s.* to 21*s.* The much approved new style, 21*s.* A suit of Black Cloth, 2*l.* 5*s.*; extra quality, 3*l.* 3*s.*; Imperial Saxony Suit, warranted to retain its colour, 4*l.* 4*s.*, at FISHER and Co.'s, Tailors, 31, King William Street, City, 10 doors from London Bridge.

---

100 CUCUMBER AND MELON BOXES AND LIGHTS for Sale. One, Two, and Three-light Boxes and Lights of all sizes ready for immediate use—best materials: packed and sent to all parts of the Kingdom by JAMES WATTS, Sash Manufacturer and Hothouse Builder, Claremont-place, Old Kent-road. Garden Lights glazed and painted complete, from 1*s.* per foot.

AGRICULTURE, COMMERCE, NAVIGATION, the CHURCH.—A. B. SAVORY and SONS, GOLDSMITHS, 14, Cornhill, London, opposite the Bank, have finished a few Splendid Pieces of PLATE, suitable for presentation to Gentlemen connected with either of the above pursuits or professions, to which they invite the attention of committees who are in search of valuable testimonials for such occasions.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. and H. can safely recommend it from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

WANTED, as SHEPHERD and OVERSEER, a single Man, in a small Farm. He must be willing to make himself generally useful, understand the lambing down of ewes, and write a legible hand. Wages, 16 pounds a year, with board and lodging.—Address, with testimonials, G. G., Hall's Newspaper Office, 223, Strand, London.—Also a Woman, from 35 to 40 years of age, as COOK; and one who can sew and get up linen, as HOUSEMAID, are wanted.

WANTED, a FARMER and his WIFE, from 30 to 40 years of age, without family, to take charge of a small Estate of 13 statute acres. The Wife would be required to be a good Laundry-woman, and understand the making up of Butter, and to take charge of the House. The Farmer, with little or no assistance, will be expected to do the work of the Farm; it will be necessary he should have some knowledge of accounts. It is important they should be of strict integrity and sobriety, as the house will be left entirely in their care nearly half the year; and it is requested none will apply who are not fully competent to undertake the duties, and can give satisfactory references.—Apply, post-paid, stating particulars, to JOHN SHARPE, Oldham-street, Manchester.

WANTED, near London, a FARMER'S MAN and WIFE; the Man as Gardener, to take charge of Horses, Pigs, Poultry, and to be generally useful; the Wife, as Servant of All-work. Wages, 20*s.* a week, with lodgings, coals, and candles. Apply by letter only, stating former services, to A. Z., 103, Great Russell-street, Bloomsbury.

WANT PLACES.—All Letters to be post-paid.

AS FOREMAN, or FOREMAN and PROPAGATOR in a NURSERY.—A person 30 years of age, who can give satisfactory testimonials as to abilities, &c.—Direct to J. S. B., Garaway, Mayes, and Co., Bristol.

TO NURSERYMEN.

AS FOREMAN AND PROPAGATOR, OR FOREMAN and TRAVELLER.—A middle-aged Man, who has been in the trade for the last ten years. Satisfactory reference can be given as to character and ability.—Direct to B. D., at Messrs. HENDERSON and Co., Nurserymen, &c., Pine-Apple-Place, Edgeware-road, London.

TO NOBLEMEN AND GENTLEMEN.

AS HEAD-GARDENER.—A Married Man, aged 36; has a thorough knowledge of his profession in all its branches, having served as head in two families of distinction in Scotland, and at present in an extensive situation in England; has had a deal of practice in forcing of every description, and likewise in planning and laying of Pleasure-grounds, Flower-gardens, &c. &c.; can produce a certificate from the Curator of the Edinburgh Botanical Garden, and testimonials from the Noblemen and Gentlemen he has served, which will stand the strictest investigation. No objection to act as Forester or Bailiff. Direct M. Z., at Mr. CAMERON'S, Curator, Botanic Garden, Birmingham.

AS GARDENER.—A Married Man, 30 years of age, without family, who has a thorough knowledge of the Stove, Conservatory, Greenhouse, and Early Forcing, of all kinds of Fruit, Flowers, and Vegetables, with the Management of Woods and Land if required.—Direct H. B., Post-Office, Chertsey, Surrey.

AS GARDENER.—A married Man, aged 40 years, who has a practical knowledge of his profession; has had great experience in Forcing all kinds of Fruit, Flowers, and Vegetables; laying out grounds, and everything connected with his profession. Can have a good character from his last employer. Apply, if by letter, G. K., Mr. Campbell's, Highgate.

AS GARDENER.—A young Man, 26 years of age, who has a thorough practical knowledge of his profession in all its branches. Can be highly recommended from a Nobleman's in Nottinghamshire. His character will bear the strictest scrutiny.—Direct to W. R., care of Messrs. Ronalds, Nursery and Seedsmen, Brentford, Middlesex.

AS GARDENER, where one or more men are kept.—A respectable middle-aged Man, who thoroughly understands his business, and is a first-rate Pine-grower; he has been accustomed to Planting and the Management of Woods, can have a 28 years' character from the gentleman whom he lived with last. Wages reasonable. Every information will be given on application to Messrs. W. JACKSON and Co., of the Cross lane Nursery, near Bedale, Yorks.

AS GARDENER.—A young Man, aged 28, who has a thorough practical knowledge of his business in all its branches, and whose character will bear the strictest scrutiny.—Direct to WILLIAM THOMSON, Gardener to George Byng, Esq., M.P., Wrotham Park, Barnet, whom the advertiser has served as Foreman for six years.

AS GARDENER.—A Scotchman, 28 years of age, will be glad to engage in a Nobleman's or Gentleman's service. He has had great experience in every department of Horticulture, and can be highly recommended by his present employer for strict integrity and a perfect knowledge of his profession in every department.—Direct to J. D., care of Mr. Brereton, Tailor, Barnet.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—The General Meeting will be held at the Society's House, No. 12, Hanover-square, London, on Wednesday the 22d of May, at Ten o'clock precisely (instead of 12 o'clock).

By Order of the Council,

London, May 3, 1844. James Hudson, Secretary.

GARDENERS' BENEVOLENT INSTITUTION.—Under the Patronage of His Royal Highness the Duke of Cambridge, and the Rt. Rev. the Lord Bishop of Rochester.

A Grand HORTICULTURAL EXHIBITION, in aid of the funds of the above Charity, will be held, by the kind permission of the Bishop of Rochester, in his Lordship's Grounds, adjoining the White Hart Hotel, Bromley, Kent, on Tuesday, 11th of June next.

Further particulars will be duly announced. The Committee take this opportunity of earnestly soliciting the aid and co-operation upon this occasion of all persons who are interested in the welfare of the Institution.

E. R. Cutler, Sec., 97, Farringdon-street.

THE WEST KENT EXHIBITION will take place in the Grounds of Vanbrugh House, Blackheath.—Tickets of Admittance, and List of the Prices, may be obtained at Mr. Bearley's Library, Nelson-street, Greenwich; of Mr. Hally, Nurseryman, Blackheath; and at the White Hart Hotel, Bromley, Kent. A Military Band will be in attendance.

AN HORTICULTURAL and FLORICULTURAL SOCIETY is about to be formed, on a very considerable scale, in the Peninsula. Nurserymen desirous of having their Catalogues of Trees, Shrubs, Plants, Seeds, &c., forwarded to the Committee of Management of the Society, are requested to address them, post paid, to G. W. Harrison, Esq., 51, Old Broad-street, City.

WHITE HART HOTEL, Bromley, Kent.—The three Splendid FUCHSIAS "Queen," "Prince of Wales," and "Magnet," as advertised in the *Gardeners' Chronicle and Agricultural Gazette* of last month, are now ready for sending out. Also a specimen of each may now be seen in flower at the above Hotel.—Bromley, May 1, 1844.

A. J. STEWART begs leave to inform his Patrons and Friends that his CATALOGUE for 1844 is now ready, and may be had upon application, inclosing 4 Postage-stamps.

A. J. S. has spared no expense in forming first-rate assortments of Camellias, Fuchsias, Geraniums, Verbenas, Petunias, and Chrysanthemums. He can guarantee that his Collections of the above-mentioned are not far surpassed by any in the United Kingdom: add to which, nearly every variety is, as far as practicable, most fully and faithfully described. His Catalogues also contain Choice Selections of Shrubby Calceolarias, Bourbon and other Roses, Dahlias, &c. &c.; with the lowest possible prices affixed to the whole.

A. J. S. regrets that he shall not be able to execute more orders for his Seedling Petunias, or Verbena "Carnea superba," than he has already been favoured with; but still solicits early commands for Verbenas "Azurea grandiflora" and "Queen of the Whites," (warranted the best of their colours ever seen;) also for his splendid Seedling Geranium "Beauty of Salthill."

Salthill Nursery, May 1, 1844.

SUPERIOR NEW SWEDISH TURNIPS.

WARNER AND WARNER, Seedsmen, 28, Cornhill, London, beg to introduce to their Friends the following New Swedish Turnips, which for their general good qualities stand unrivalled; growing to a large size, being small in the top, of a dark yellow flesh, and may be grown as close to each other as a Stone or Stubble Turnip.

WARNER'S RUSSIAN SWEDE . . 2*s*. 6*d*. per lb.
WARNER'S EMPEROR SWEDE . . 2*s*. 6*d*. per lb.

Also Warner's Purple-top Yellow Hybrid, 2*s*. 6*d*. per lb., with all the varieties of Norfolk and Tankards, of the most genuine and selected stocks, from 9*d*. to 1*s*. per lb.

SPLENDID LARGE, DEEP-BLUE ANAGALLIS and SUPERB CINERARIAS.—Plants of that large, splendid deep blue, full and complete round-petalled ANAGALLIS BREWERII, being of a strong and vigorous habit, are well adapted for bedding out; 12*s*. per dozen.

SUPERB CINERARIA SEED, saved from the most esteemed named kinds, and other new and beautiful Seedlings, comprising every shade of dark and light-blue, at 2*s*. 6*d*. per packet. Strong flowering plants of the above, 12*s*. per dozen. Applications, including Post-office orders, will be immediately executed.—Direct to Michael Brewer, Sen., Cambridge Nursery.

NOW SENDING OUT.

PETUNIA PUNCTATA.—Although the orders for this excellent Plant have been most numerous, a few strong healthy Plants remain yet unbespoke; 7*s*. 6*d*. each plant, postage free. W. Miller, Ramsgate.

EXHIBITION OF TULIPS.

H. GROOM, Clapham-Rise (late of Walworth), by Appointment Florist to her Majesty, respectfully informs the Nobility, Gentry, and Amateurs, that his superb Collection of TULIPS is now in full bloom, and will continue in perfection until the 21st of May, and can be viewed every day from 9 o'clock until 6, Sundays excepted. Admission, 1*s*.

The Moult, Salcombe, Devon, and a Collection of semi-double Pansies, from an amateur, Chesterfield, merit the best thanks of the Society.

The Society also embrace this opportunity of thanking Messrs. Powell and Leland, and Mr. Ross, for the many excellent Microscopes; and Mr. Varley for the Graphic Telescope which were exhibited.

GREAT YARMOUTH NURSERY. NORFOLK, 1844.

YOUELL AND CO.,

PATRONISED BY HER MOST GRACIOUS MAJESTY THE QUEEN; HIS MAJESTY THE KING OF THE BELGIANS; NURSERYMEN AND FLORISTS BY SPECIAL APPOINTMENT TO HER MAJESTY THE QUEEN DOWAGER.

NOW READY FOR SENDING OUT.

THE NEWEST AND VERY BEST FUCHSIAS, VERBENAS, PETUNIAS, ANAGALLIS, &c.

FOR 1844.

YOUELL AND Co. beg to refer the Readers of the *Gardeners' Chronicle* to their Catalogue of the above, which appeared in this Paper of the 27th of April, and will be found to contain such varieties only as are worthy of cultivation.

Youell & Co. being the parties who first sent out per post, with safety, these tribes of plants, are desirous of calling attention to their advantageous method of executing orders, namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, upon the following terms:—

12 Extra Fine varieties, 12*s*., the Selection left to Youell & Co.
12 ditto ditto 21*s*., the Selection left to the Purchaser.
50 Fine varieties . . 40*s*., the Selection left to Youell & Co.
50 Extra Fine ditto . 60*s*., the Selection left to the Purchaser.

VERBENAS.

12 Extra fine Varieties, 6*s*., the selection left to Youell & Co.
12 Ditto ,, 10*s*., the selection left to the purchaser.

PANSIES. [Sent postage free.]

12 Fine Show Varieties, by name . . 10*s*. per dozen
12 Extra Fine ditto, do. . . 18*s*. ,,

CHRYSANTHEMUMS. [Sent postage free.]

Fifty of the newest best varieties by name, 12*s*. per dozen; for list and colours of which, see Advertisement of April 27.

FLOWER-SEEDS.—30 Packets of the choicest and newest kinds sent per post free for 6*s*.

ARAUCARIA IMBRICATA IN POTS.

Recently planted most extensively at Her Majesty's Gardens at Windsor, and also at the Royal Gardens, Claremont, furnished by Youell and Co.

YOUELL AND Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust 4-year-old plants, 8 to 10 inches high, 10*l*. per 100, or 30*s*. per dozen.

Fine Plants of CEDRUS DEODARA, in Pots, 2ft. to 2ft. 8 ins., 10*s*. 6*d*. each.

Great Yarmouth Nursery, May 2, 1844.

N.B. All Orders above £2 are delivered carriage free to London or Hull, or plants added to compensate for the same.

TULIPS; A CHOICE COLLECTION TO BE DISPOSED OF.

THOMAS MAY, Florist (established upwards of 30 years), George-street, Lower-road, Islington, announces his intention of disposing of his stock at a low price. The Collection consists of all the choicest varieties, including many superior Seedlings.

SEEDLING GERANIUMS.

WILLIAM E. RENDLE having raised a few GERANIUMS, from seeds procured from some of Mr. Lyne's superior sorts, and considering that many Amateurs would feel interested, and desirous of cultivating a few choice Seedlings, now offers an opportunity to those inclined to speculate, and will forward a dozen Seedling Geraniums, securely packed, and forwarded to the Beam-bridge terminus of the Great Western railway, on receipt of a Post-office order for One Guinea. Strong Plants in 48-sized pots.

William E. Rendle's Spring Catalogue of Geraniums, Dahlias, Fuchsias, Camellias, New Plants, &c., is just published, and can be had on application.

Union-road Nurseries, Plymouth, May 1, 1844.

NEW DOUBLE WHITE BRUGMANSIA, B. KNIGHTII.

THOMAS CRIPPS, Nurseryman, Tunbridge Wells, respectfully intimates to his Friends he has now ready for sending out Plants of the above Double and delightfully fragrant dwarf-flowering Brugsmansia, at 21*s*. each, in 48 sized pots, or small, in thumb pots, 15*s*., with the usual discount to the Trade.

GREENHOUSE AND STOVE PLANTS.

LOUIS VAN HOUTTE (Florist to His Majesty the King of Belgium), Ghent, begs to announce to the Trade and the Public in general, that his Price-Current, No. 16, containing the Greenhouse and Stove Plants, is published. The Trade who have not yet received it may find it at Mr. George Rhan's, Crescent, Minories.

N.B.—L. V. H. would be glad to purchase some bulbs of Calochortus splendens and Venustus, and of Amaryllis solandriflora.—Address to Mr. George Rhan, Crescent, Minories, London.

SUPERB SEEDLING DAHLIAS TO BE SENT OUT FIRST WEEK IN MAY.

GAINES'S "Princess Alice,"—Pure white, very full centre, the petals finely cupped; was considered by all who saw it growing the best White Dahlia; gained several prizes; a good show-flower, 4 ft., 10*s*. 6*d*.

Gaines's Twickenham Rival.—Fine yellow, occasionally tipped with red; a superb round thick petal, fine circular form; the best yellow yet offered to the public; gained several prizes; a good show-flower, 4 ft., 10*s*. 6*d*.

Gaines's Countess of Zetland.—Blush, tipped with lilac fine round thick petals; a good show-flower, 4 ft., 10*s*. 6*d*.

Gaines's Enterprise.—Crimson purple, a superb show-flower, 4 ft., 10*s*. 9*d*.

A List of Dahlias, Pelargoniums, Pansies, Calceolarias, Fuchsias, Verbenas, Auriculas, Cinerarias, Chrysanthemums, &c., containing many New Seedlings of first-rate qualities, may be had by application at the Nursery, Surrey-lane, Battersea.

CHESHUNT NURSERIES, HERTS.—NEW ROSES.

A. PAUL AND SON, in submitting the following varieties of NEW ROSES beg to remark that the plants are well established, and can be so packed as to travel with perfect safety to any distance.

Hybrid Perpetual—La Reine		15s.	0d.
,, ,, Baron Prevost		3	6
,, ,, Lady Elphinstone		10	6
,, ,, Madame Dumeme		5	0
,, ,, Earl Talbot		2	6
,, ,, Marquisa Boccella		5	0
,, ,, La Bedoyere		21	0
Perpetual—Laurence de Montmorency		7	6
Bourbon—Virgil		5	0
,, Imperatrice Josephine		7	6
,, Delille (new)		5	0
Moss—Rosinella		15	0
Austrian Persian Yellow		5	0

These and every other really valuable variety known are now ready.

A Post-office order on the Waltham-cross Post-office, or reference, respectfully requested from unknown correspondents.

N.B.—All packages forwarded to London free of carriage.

BUSHELL'S Light Seedling DAHLIA, "EMMA."—Plants in May, 10s. 6d. Colour white, tipped with deep cherry; the petals, form, and centre good; the largest, most constant, and free in flowering, of any Dahlia yet propagated, and has obtained several prizes. "PET RIVAL," plants in May, 5s. Colour, purple maroon; fine cupped petal, and free bloomer; exhibited in several winning stands last season. "KENNINGTON ROSE," plants in May, 5s.; most constant rose grown. To be had of Messrs. ANSELL, Camden-town; S. GIRLING, Stowmarket; F. and A. SMITH, Hackney; and J. BUSHELL, 12, Hall-place, Kennington-lane.

FUCHSIA DICKENS.

J. INGRAM, NURSERYMAN, Southampton, begs to offer the above-named unique FUCHSIA at 7s. 6d. each, with an allowance to the Trade if three or more are taken. Its character is that of Formosa elegans, but far excels it in point of size, colour, and general habit. Should it not turn out as described, no charge shall be made.

J. INGRAM, 9, Above-Bar Street.

MAY'S "QUEEN OF MAY" CINERARIA.—The above new and beautiful Cineraria is now ready to be sent out by post, or otherwise, at 5s. 6d. each, including case, prepaid. It is confidently recommended as being one of the most splendid novelties that has been offered in Cinerarias; the colour being a beautiful light sky-blue; the flowers large and of good form; the plants compact, shrubby, and dwarf in growth—may be had of the principal Nurserymen in the kingdom.

W. M. begs to state that his descriptive List of new, superb Calceolarias may be had on application to WILLIAM MAY, Hope Nursery, Bedale, Yorkshire.

W. M. also begs to intimate that he cannot supply any more Eucharidium grandiflorum.

R. WHITE & Co. beg now to offer Plants of the following, viz., Achimenes longiflora, strong Plants for specimens on their own bottoms, at 2s. each; Do. do., good flowering Plants at 9s. per dozen. Achimenes grandiflora, strong specimen roots, 3s. 6d. each; Do., smaller, 2s. A. pedunculata, do., 1s. each; A. coccinea, do., specimen, 9s. per doz. A. rosea, do. do., 9s. per dozen. ANAGALLIS BREWERII, 1s. each, or 9s. per dozen. CHRYSANTHEMUMS, 40 superb varieties, one plant of each, 21s. DAHLIAS, including all the finest old varieties, and the following new ones, viz., Standard of Perfection, Orange Superb, Lady Antrobus, Emma Noke, Madame Chevain, Essex Triumph, Oakley's Surprise, Antagonist, Blue Bonnet, Queen of the Isles, &c. &c., at very moderate rates, or where the selection is left to us, at 10s. 6d. per dozen, or 50s. per 100, which may include the last-named five new kinds, and will be made up with other really good sorts.

FUCHSIAS—London Rival, Globosa Grandiflora, Espartero, Stanwelliana, Prince of Wales, Monarch, Bridegroom, Integrifolia, Kentish Hero, and all the other new kinds, at moderate prices, or a Collection of 20 superb kinds, including some of the new ones, and any of the following, viz., Venus victrix, Exoniensis, Laucii, Greenwich Rival, Magnifica, Gigantica grandiflora, St. Clare, Bruciana, Eximia, Woodsii, Conspicua, Arborea, Devonia, Splendens, Youelln, Formosa elegans, &c., for 21s., or 10 for 10s. 6d.

GERANIUMS in superb collections, 40 good varieties, 63s.; 20 do. do., 42s.

PETUNIAS, good sorts, per dozen, 4s. The following new varieties:—Punctata, Beauty Supreme, Celestial, Formosa, Ne plus Ultra, Splendida, Speciosissima, Multiflora punicea, Gem, Superb, 21s. the Collection, or separately at moderate rates.

VERBENAS.—Finest old varieties, per doz., 4s. The following are seedlings, viz.:—White's Wonder, Perfection, Modesty, Variabilis, Cooperii, Surprise, Simperii, Stewart's Queen of the Whites, Azurea grandiflora, Carnea superba, Pearson's Teucroides atrosanguinea, do. Princess Alice, Speciosissima, Beauty Supreme, Teucroides cœlestina, Miller's Blue Queen, Zeuxis, Smith's Excelsa, Array, Delicata, and Striata—the Collection, 31s. 6d.

Scarlet Geraniums, Heliotropes, Calceolarias, &c. &c., for bedding out; and every description of plant at moderate prices.

Orders from unknown correspondents must be accompanied by remittance; and orders amounting to 5l. will be delivered free.—Bone Manure—Dust, 20s., Mixed, 19s. per qr.; Guano, 11s. per cwt., or 10l. per ton, warranted genuine. Agents, by appointment, for the sale of Whitney's Composition.

Poole Nursery, Dorsetshire.

JAMES CUTHILL, FLORIST, Denmark-hill, Camberwell, has a large collection of GERANIUMS, VERBENAS, HELIOTROPES, PETUNIAS, and FUCHSIAS for stands or planting out at reasonable charges. J. C. has a few packets of his LISIANTHUS RUSSELLIANUS SEED, with directions, at 2s. 6d. per packet. Also, his PRINCE OF DENMARK Nosegay Border CARNATION, 12s. per dozen, very fine strong roots. N.B.—J. C. hopes, in the course of the summer, to bloom two or three new Lisianthus, which he will have great pleasure in announcing.

SKIRVING'S IMPROVED SWEDE TURNIP.

W. SKIRVING, SEEDSMAN, Queen-square, Liverpool, begs to acquaint his Agricultural Friends and the Public, that the price for the present season of the Genuine Seed of his improved Swede Turnip is 1s. 6d. per lb.; the sort warranted the same as that for which he received the Premium of the Royal Agricultural Society of England. All other sorts of Turnip-seeds of the common kinds at the usual prices; also the most approved varieties of Mangold Wurzel, large White Belgian and Altringham Carrot.

For permanent Pasture, W. SKIRVING begs to offer his Selection of the most useful Perennial Grass-seeds. The sorts selected from personal observation of the growth and habits of the different Grasses grown in his experimental Grounds at Walton. On this system he has supplied within a few years, Seeds for many thousand acres, which have given every satisfaction. Orders stating quantity and quality of land to be laid down, will be correctly executed, with a suitable mixture.

For alternate Cropping, W. S. can recommend Seed of pure Italian Rye-grass, grown and carefully saved on his own farm.

GRASS SEEDS.

HENRY D. CORMACK, SEEDSMAN, &c., begs to inform Agriculturists in general that they can be supplied with every variety of the Natural Grasses, adapted to the soil, properly apportioned and combined, from his Wholesale and Retail Seed Warehouse, 106, Dean's-gate, Manchester.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WILLIAM WOOD and SON respectfully invite the attention of their Friends, and Amateurs, to their Extensive Stock of New Plants, adapted for bedding, CAMELLIAS, GREENHOUSE and HERBACEOUS PLANTS, SHRUBS, and CLIMBERS, together with a Splendid Collection of the Newest and Best ROSES of the season, Catalogues of which may be had GRATIS on application.

W. W. & S. have the pleasure of offering the following at moderate prices, the selection of varieties being left entirely to themselves:—

FUCHSIAS, per dozen—Extra fine varieties, 6s. and 9s.; Extra new and fine do., 12s.; 50 fine and distinct do., for 40s.

CINERARIAS, per dozen—Fine distinct varieties, 6s. and 9s.; Extra fine and new do., 12s. and 18s.

VERBENAS, per dozen—Good and distinct varieties, 5s.; Extra fine do., 9s. and 12s.; Extra superb and new do., 18s.

PETUNIAS, per dozen—Extra fine varieties, 6s. and 9s.

The above are now ready for immediate transit, and may be had either in strong plants, packed in baskets, or they will be supplied in smaller plants, and sent by post, at the option of the purchaser.

,, New White Decanter	0	9

Parties wishing to buy by the bushel may have a priced Catalogue on application.

Improved Long Red Mangold Wurzel	0s.	8d.	per lb.
Superior Yellow Globe do. do.	0	9	,,
Superior Red do. do. do.	0	9	,,
Fine Selected Altringham Carrot	0	9	,,
Large Green-top White Belgian do.	0	8	,,

Grass-seeds adapted to soils of every description, so as to insure a good sward, either in Lawns, Parks, permanent Pasture, or alternate course of Husbandry.

J. G. W. respectfully announces to the Nobility and Gentry that he can supply them with plants of TRINDER'S NEW PINE, he having purchased the entire stock. This is a most delicious Pine, surpassing all others in flavour; has obtained prizes at Bromley and elsewhere. Three fruits were exhibited at the Horticultural Society's Rooms, on the 7th of last Nov., for which a letter of thanks was awarded; Dr. LINDLEY afterwards noticed them in the *Gardeners' Chronicle*, and their respective weights were 2 lbs. 12 oz., 3 lbs., and 3 lbs. 4 oz.; they measured 5 inches in diameter, and 7 inches in length. Fruiting plants, 15s. each; Succession do., 10s. 6d. each.

ORANGE AND LEMON TREES, 9s. 6d. to 30s. each.

R. HALL begs to advise that he has just received a fresh consignment of 50 TREES, varying from 18 inches to 6 feet in stem, remarkably handsome and very healthy, at his Foreign Warehouse, 63, South Audley Street, Grosvenor Square, facing the Chapel.

JOHN RIVERS, Sawbridgeworth, Herts, begs to inform Agriculturists in general that the MANGOLD WURZEL and SWEDISH TURNIP enumerated beneath are new and of his own growth, and can be recommended with confidence. The Russian Swede, with yellow skin and yellow flesh, was imported by him in 1836, it has been since carefully selected, and is recommended for productiveness and superior hardiness, and for its not being so liable to mildew as the Liverpool and other dark-coloured varieties.

Long yellow Mangold Wurzel, growing much out of the ground, fangless, with fine top	1s. per lb.
White-fleshed, purple-skinned Globe, for thin soils,	1s. per lb.
Long Purple, superior stock	9d. per lb.
Russian Yellow Swedish Turnip	2s. per lb.

Carriage paid to London.

Lawn Grasses, mixed with dwarf Clovers, warranted to insure a fine sward (weight 20 lbs. per bushel), price 14s. per bushel; Pasture Grasses mixed for any description of soil, varying in price from 8s. to 12s. per bushel; three bushels per acre recommended upon a clean tillage, to be sown at Midsummer, with a portion of Lucerne, Perennial Clover, and Saintoin, upon soils that are not too retentive of moisture.

If a description of the soil intended to be laid down is given, J. R. trusts, by attentive observation of the various Pasture-Grasses, both separately and in pasture, upon various soils, to give satisfaction to those favouring him with their commands.

WM. JOHN CORMACK, AGRICULTURAL SEEDSMAN by Appointment to His Royal Highness PRINCE ALBERT, New Cross, Surrey, and Bedford Conservatory, Covent Garden, begs to call the attention of the Nobility, Gentry, and Agriculturists in general to his combinations of GRASS SEEDS for Permanent Pasture, the Alternate Husbandry, Parks, Lawns, &c. (as recommended and practised by his partner, the late Mr. GEORGE SINCLAIR, Author of the "Hortus Gramineus Woburnensis.") Upwards of 25,000 acres have been converted to permanent pasture by this establishment with the greatest success. Parties requiring Seeds are respectfully requested to state the nature of the soils. Mangold Wurzel, Carrot, and Turnip-seed of excellent sorts, saved from transplanted bulbs. Garden and Agricultural Seeds of the best quality and most approved kinds.

N.B.—Cormack's British Queen and Prince Albert Peas, at 3s. 6d. per quart.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, Hothouse Builders, &c., Gloucester-place, Chelsea, beg to inform Horticulturists that they have made great improvements in their excellent and simple plan of Shading, whereby the largest or smallest can be instantly covered or uncovered with a sheet of canvas. To be seen in use at most of the London Nurseries, and at the Horticultural Manufactory, Gloucester-pla., Chelsea, near Sloane-sq.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to Public competition at the Auction Mart, Bartholomew-lane, on TUESDAY, May 7, and THURSDAY, May 9, 1844, at 12 o'clock each day, a fine collection of DAHLIAS, comprising all the leading varieties; also a splendid assortment of GERANIUMS and other PLANTS in bloom. The newest varieties of FUCHSIAS, VERBENAS, HEARTSEASE, &c., and a variety of other PLANTS for transplanting. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

TO NURSERYMEN and OTHERS.

TO BE DISPOSED OF, on moderate terms, with immediate possession, a long-established NURSERY, most eligibly situate on the Surrey side of the Bridges, and within four miles from either of them. The premises consist of about Three Acres of Land in a very high state of cultivation, and in the centre of a populous and wealthy neighbourhood; a Cottage, a Greenhouse, a Pit, and a Seed-Shop.—For further particulars apply by letter, post-paid, to S. T., Mr. Collis, Cold Harbour-lane, Brixton, Surrey.

CHOICE FLOWERS AND PLANTS IN POTS.—HUMPHREYS'S INODOROUS SOLUBLE COMPOUND. Fertilizing Agents of great power are here combined in a highly-condensed form, so that a few grains of the powder dissolved once a week, or once a fortnight, in the water used with plants, are sufficient to produce a vigorous growth and splendid flowers. Highly effective with GERANIUMS, CACTI, PANSIES, PELARGONIUMS, HEATHS, VERBENAS, CARNATIONS, &c. See *Gardeners' Chronicle*, &c.—Sold in Bottles, 1*s.* 9*d.* each, by the leading Seedsmen in town and country. Wholesale Agents: DAVY, MACMURDO, and Co., 100, Upper Thames-street, London.

HORTICULTURAL SOCIETY OF LONDON. EXHIBITIONS AT THE GARDEN.—The First Meeting will take place on SATURDAY the 18th of May; subjects for Exhibition must be at this Office on Friday the 17th; or at the Garden before half past Eight o'clock A.M., on the day of Exhibition.

Exhibitors will be provided with a printed form in which they will state, for the information of the Judges, whether their plants, &c., have been shown previously during the Season. The gates will be open at One P.M. Tickets are issued to Fellows at this Office, price 5*s.* each; or at the Garden, in the afternoon of the days of Exhibition, at 7*s.* 6*d.* each; but only to orders from Fellows of the Society.

N.B. No Tickets will be issued in Regent Street on the day of Exhibition.—21, Regent Street.

The Gardeners' Chronicle.

SATURDAY, MAY 4, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

MONDAY,	May 6	Entomological	8 P.M.
TUESDAY,	May 7	Horticultural	3 P.M.
		Linnean	8 P.M.
WEDNESDAY,	May 8	Society of Arts	8 P.M.
WEDNESDAY,	May 15	Microscopical	8 P.M.

COUNTRY SHOW.

WEDNESDAY, May 15 . Hammersmith Heartsease.

THOSE who wish to know when *not* to plant, should visit the Nurseries just now, and see the CONDITION OF THE SPRING-PLANTED TREES. They will find them dead and dying by thousands. That this must be so is only what common sense, and a very limited acquaintance with the nature of things, would indicate. Nevertheless experience tells us that many people are as deficient in good sense as in Vegetable Physiology, and that in spite of both they will plant late in the spring. The practice of the Nurserymen, who must, it is said, have much experience, and whose interest it is to perform this operation rightly, seems to sanction the custom. But it is forgotten that Nurserymen plant late in the spring because they cannot help it. They are forced to defer their own operations until their customers discontinue buying; and because their customers choose to procrastinate, till transplanting is all but impossible, the Nurserymen are annually constrained to attempt the impossibility.

This question has been formally discussed in the "Theory of Horticulture," and we are not aware that anything more can be said upon the subject. Nevertheless, as many people will read a newspaper who cannot fatigue themselves with a book, it may not be unprofitable if we again explain the arguments against late spring planting.

Some years since a planter had some rather large Yews to remove. As such plants are hard to preserve, and he was therefore anxious to insure success to the operation, he consulted a person who had had what is called "great experience" in planting, who advised him to remove them by all means in the spring. The advice was followed, the month of March was taken, and five out of six of the trees died. Now, the reasons given by the "experienced" man were, first, that if such trees were planted in the autumn they would be blown about in winter and chafed half through at the ground-line; secondly, that their roots would all be rotted by water stagnating about them in winter; thirdly, that everybody knows spring to be the proper season for planting Evergreens; and fourthly, that in "all his experience" he had never planted Yews in the autumn with success. He forgot that the wind blows in spring as well as at other seasons of the year, that the chafing at which he was so alarmed might be prevented by a dozen simple contrivances, that water stagnating about roots is more mischievous in spring than at any other time; and it is not impossible that the reason why he never planted Yews successfully in the autumn, was that he never tried; which was the more likely, since he was one of a chattering over-bearing race which habitually confounds assertions with facts, thinking one perhaps to be as good as the other.

If we search for solid reasons why spring planting should be adopted, we fail to discover the least resemblance to them; or, if resemblances to reason do appear, they vanish the moment they are examined. The great argument in its favour is its occasional success; but this is of all reasons the most unsatisfactory. There are men in this country who drink enormous quantities of wine, and live to a great age, without gout, indigestion, or even a headach; but we should hardly take such cases as favourable to deep potations. In the same way trees have been planted at Midsummer, in June, in August, and they have sometimes lived; but who would dream of selecting June, Midsummer, or August, for the operation?

The cause of death when trees are removed is almost entirely that they lose the fluid contained within them faster than it can be renewed; the end being the drying up of their vessels, which is immediately followed by a loss of vital force. If we inquire whether the circumstances to which spring-planted trees are exposed are favourable or unfavourable to this fatal loss of fluid, we find them to be the former in an enormous degree. The air is peculiarly dry in the spring, and frequently in rapid motion at the same time; all objects exposed to a current of dry air must part with their moisture rapidly; and consequently, such a state of things is most unfavourable to plants which require to retain their moisture. At first their young bark is the channel through which the moisture flies off; but as soon as young leaves appear, should the trees live long enough, and the perspiring surface is thus extended, this loss goes on with far greater rapidity, and life is soon extinguished. Evergreens, which have always a very large perspiring surface, are on that account exposed to much more danger, and consequently the losses among them are much greater. That the excessive loss of fluid from the interior is the true cause of death in newly-planted trees was proved, by we think, Mr. Knight, who surrounded their stems with damp moss and thus preserved them.

Established trees suffer nothing from the dry air of spring, because their roots are unmutilated, and restore the moisture as fast as it flies off from the surface. But newly-planted trees, whose roots are necessarily much mutilated, suffer, because they cannot obtain fluid from the soil until the roots are renewed, and before that can happen they are dead; for the feebleness of the stem actually diminishes the capability of the plant to renew its roots.

But it is said that if a tree is just budding when planted it is in the most favourable state, because it will immediately make fresh roots, the act of vegetation upwards being simultaneous with growth in a downward direction; and that is true. There is here, however, a fallacy: it is assumed that the upward and downward vegetation will go on when a plant is transplanted as well as if it is left in its former place; that, however, depends upon the external conditions to which it is exposed. If the surrounding air is damp, and remains so, evaporation being thus prevented for a sufficiently long time, roots will be quickly formed, and the plant will go on growing; on the other hand, if the air is dry, and exhausts the branches of their moisture, new roots cannot be formed, and the plant will die. Life, in such a case, is staked upon the chance of the atmosphere being in a very favourable state; and the chances are ten to one against its being so.

These considerations abundantly prove the spring to be the worst of all seasons for a planter. We shall hereafter consider what the best season is.

NATURALIZATION OF THE CAMELLIA.

THE climate of the west of Normandy being generally as severe in winter as that of considerable portions of England and Ireland, it is reasonable to conclude that plants which are found to thrive in the open air in the former country will succeed in the other two. M. Bataille, the curator of the Botanic garden at Avranches, in the department of La Manche, has about a dozen fine Camellias in his private garden, where they have been seven or eight years, without suffering injury from the influence of winter; they have had no protection from the weather, except a little matting around them in hard frost. The seeds were sown by M. Bataille in the open ground, in August, 1836; these were examined in the following spring and found to be enlarged; the radicles had burst from the envelopes, and were directed inwardly to extract the nourishment necessary to the farther development of the young plants, which then exhibited the primitive leaves. During the summer they attained some vigour; and straw was occasionally laid over them during the ensuing winter, which so completely secured them from the effects of frost, that they were in full possession of their vegetating powers in the spring following. One of them flowered in 1841, for the first time, and last year five flowered; and the same plants are now about to produce their showy blossoms. I have seen Camellias in the open ground in England and Ireland; last year the Earl of Shannon had several at Castle Martyr, but those were raised from seed sown in hot-houses, and the plants were transferred from the greenhouse to the garden, and therefore have a very uncertain existence there. Common sense would lead one to form this conclusion; but besides, actual experiment tends to prove that seeds unnaturally forced into germination, and kept in their subsequent early stages in warm habitations, will ever afterwards preserve a constitutional delicacy that cannot resist severe pressure. The predecessor of M. Bataille, supposing that he might render the Camellia an acclimated shrub in Normandy, removed from the greenhouse a single flowering plant of that kind to the garden, where it matured its seeds, from which many plants were obtained that yielded (by grafting) double flowers; but as he committed the error of sowing the seeds in a hot-bed—which seeds, be it remembered, were the produce of a plant which had been reared in an unnatural state, for such the greenhouse surely is—all the plants raised by him, excepting one, which has a very consumptive appearance, have died. The Camellia, or Rose of Japan, in its native clime, attains the height of 12 or 15 feet, and though we cannot suppose that it can be altogether acclimated in our ungenial country, where the element of heat, comparatively, is so deficient, there is reason to hope that, with such nurture as M. Bataille has bestowed on it, this very ornamental plant may be rendered, in the course of some years, sufficiently hardy to occupy a permanent position in the British shrubbery.—*Martin Doyle.*

ENTOMOLOGY.

THE EARTH-WORM FLY (*Sarcophaga carnaria.*)—There can be no doubt that Earth-worms are exceedingly useful in loosening the soil, and enabling the rain to penetrate to the roots of plants more freely; at the same time they manure the land, and very probably render it more productive, by the change which it undergoes in digestion; for the innumerable casts one sees piled up on the surface have all passed through their bodies. Worms are, however, such enemies to neatness on gravel walks and lawns, they do so much mischief by drawing young plants into their burrows, and render those in pots so unhealthy, that the gardener naturally enough considers them a very great nuisance; he has, however, a friend amongst the Diptera, which may assist extensively in their diminution. And this is a fresh instance of the services rendered by that order of insects; for troublesome and even offensive as flies are, often compelling us to protect our food from their inroads, and others destroying the productions of our kitchen-gardens, yet the Muscidæ, in their larva state, are amongst the most numerous and efficient of Nature's scavengers, sweeping away the putrescent matter which is hourly tainting the air we breathe: and there are many others that are eminently useful in keeping under the vegetable feeders in this extensive race of minor animals. Amongst those which may be termed animal-feeders is the larvæ of the fly above alluded to, which is a natural parasite of the common Earth-worm, Lumbricus terrestris. The parent flies are abundant in gardens and fields, on heaths and probably in every place inhabited by worms; in fine weather one sees them flying in pairs, generally along pathways, and alighting at short distances when disturbed; they likewise resort to many umbelliferous flowers, from which they imbibe honey with their large fleshy lips. They are numbered amongt the flies whose larvæ feed upon meat, but there is a part of their economy which was unknown to me until a very ingenious observer of the habits of insects* communicated an interesting fact which came under his own observation. On the 18th of June, after a shower of rain, he found in a garden-path a common Earth-worm, motionless, with several small white maggots crawling over its body; on taking it up the worm began to writhe about, when the little maggots made their way to a hole in the thickened band encircling the body, which they immediately entered, their tails only being exposed, which Mr. Bolt believed was for respiration. The Earth-worm lived about four days, when the maggots had materially increased in size; another live worm was then given to them, but it did not live long; the maggots, however, only six in number, nearly devoured the first before they began the second; by the 25th it seems they had arrived at their full size, for three made their escape, but the others were put into a small box with some damp mould, where in a few days they became pupæ; these were transmitted to me, and in the beginning of the following June I bred three female flies from them. The maggots, De Geer says, are exceedingly like those of the common flesh-fly, or blue-bottle, and the pupæ are oval, coriaceous, of a chesnut brown; ringed, with two minute points at the head, and an aperture at the tail surrounded by small tubercles.

The Muscæ of Linnæus, which contained a very large portion of the Diptera, have been divided by recent writers into many genera, as may be seen by the arrangement in Curtis's "Guide."† One of these new groups has received from Meigen the appellation of Sarcophaga, in allusion to the larvæ living upon flesh; and to this genus belongs the Earth-worm fly, which was described in the "Fauna Suecica," and is now called Sarcophaga carnaria. The male is black and shining, with a slight blue tinge; it is also pubescent, with numerous long bristles scattered over its whole body; the antennæ are drooping, with a feathery bristle; the lip is long, the palpi distinct and clavate; the head is produced in front, having a silky lustre of an ochreous tint and a broad stripe of black down the crown, near the base of which are placed three minute ocelli; the eyes are not contiguous; they are large, oval, and rusty brown; the scutel is large and semi-orbicular; the abdomen is oval, the apex a little incurved, curiously formed, and very bristly; the back is beautifully tessellated with silky gray and chalybeous black; the wings are longer than the body, dirty white, the nervures brown, the two large posterior cells closed at the extremity by oblique sinuous nervures; poisers concealed beneath large pocket-shaped whitish squamulæ, on each side of the scutellum; legs stout, very hairy, and bristly—anterior pair the shortest; hinder tibiæ clothed

* Mr. John Bolt, of Lyndhurst, Hants.

† See Genera 1269 to 1291, &c.

internally, except at the base, with very fine and longish hairs; tarsi five-jointed; claws slender, curved, and pointed, excepting the anterior, which are cut off abruptly, and look as if broken; the pulvilli are very large and bilobed (figs. 1, 2, the natural dimensions). The female is rather smaller, the lip and palpi are shorter, the eyes are farther apart, the apex of the abdomen is less bristly, and not incurved, the hinder tibiæ are not internally hairy, and the claws are alike, being all pointed, and the pulvilli are much smaller.

It may be observed that the economy of this fly was partly known to Scaliger, and has often been investigated on account of the viviparous properties of the females; and, according to Réaumur, an individual of that sex has been ascertained to contain 20,000 of these little maggots. I see by my journal that the flies were very abundant on the flowers of the Sea-holly, on the coast of Kent, the first week in August, and they are met with till the end of that month, as well as during the whole of June and July. —*Ruricola.*

PLAN OF AN ORANGE-HOUSE.

THE following is a section of a stove at Lee Hall, the seat of W. Dakill, Esq. There are many persons, amateurs especially, who cannot devote a separate house to the culture of the Orange tribe, that would be glad to be made acquainted with some plan by which they might be enabled to grow a few Oranges without their materially interfering with other things. Mr. Dakill has adopted an excellent plan, by which he can grow Oranges, Pines, and Vines all in one house; and in this he succeeds extremely well. In the centre of the house stands a

common Pine pit (*a*) eight feet in breadth. At the back of the pit a narrow border (*b*) is made by running a partition, a brick in thickness, along the whole length of the pit, and of the same height as the back retaining wall. The border is 12 inches in breadth, and of the same depth (six feet) as the Pine-pit, with plenty of drainage in the bottom; *c* is the front path, *d* the back path, *e* the flue; *f* is a light wire trellis, supported by iron rods; it is arched over the back path, and the Oranges, &c. are trained over it. There is a trifling inconvenience attending the mode of having the Oranges planted at the back of the bark-bed, for the back rows of Pines cannot be so readily examined; but this inconvenience is in a great measure obviated by leaving openings here and there in the trellis, so that the Pines may be better looked over. The trellis offers no impediment in letting down the sashes for air, nor does it materially interfere with the Vines which are trained up the rafters. It would certainly be better to have the Oranges, Pines, and Vines each in a separate house; but the fact that they can be grown together in one house is worthy of attention. The Oranges in Mr. Dakill's pit are subjected, winter and summer, to a little bottom-heat from the tan; and it appears to agree with them. With the above exception, the management is much the same as at Hurst House.

The back wall of one of Mr. Dakill's houses is covered with Psidium Cattleyanum, which, though much shaded, bears tolerably good fruit. It is probable, however, that some of the Citrus tribe would suit this place better than any of the Guavas. The Oranges, &c., being trained, the path must necessarily intercept a large portion of the sun's rays from the plants against the back wall, and, consequently, the fruit would not be so good; but if these latter plants served no other purpose than that of covering the wall with fine green foliage, they would be well worth their room; possibly they might produce such fruit as can be used in an unripe state. In a wild state the Orange tribe are frequently found growing as underwood in large shady forests, which is a proof that if not their proper habitat, they can accommodate themselves to such situations.

I am afraid any attempt to grow fine Oranges in pots or tubs will never be attended with success. However large the pots or tubs may be, it is very difficult to keep the plants in health for any length of time. The only argument in favour of growing Oranges in tubs, is their portability, so that they can be carried to any part of the garden to decorate terraces, &c. The uniform supply of moisture, and the uniform temperature to which the roots are subjected when in pits, doubtless tend greatly towards keeping the plants in uninterrupted health. There are, however, two or three varieties which may be grown in pots; the Myrtle-leaved (two varieties), the Mandarin, and indeed any of the dwarf-growing kinds; but even these are grown much better in pits. Mr. Durden has found that the fruit of the Myrtle-leaved varieties makes a better marmalade than any other kind.—*J. W. Jones, Knowsley.*

NOTES ON AMERICAN PLANTS.

[FROM PERSONAL OBSERVATION.]

Hemlock Spruce.—On steep declivities and in ravines crowded with various timber-trees, the Hemlock Spruce is seen in the U. States towering up from 60 to 100 feet, as straight and symmetrical in form as is the finest specimens of common Spruce or Silver Fir in this country, and apparently growing equally as fast as they. In the same localities, where it grows so fine, but in open exposed situations outside the woods, it constantly assumes the bushy habit, seldom rising higher than six or eight feet, and having a stunted sickly appearance. I never found a single plant looking healthy, or having a straight trunk in open places, but always being low spreading bushes, with every appearance of old age, many of them with their branches loaded with cones, and nearly touching the ground. From this it would appear that without good shelter and partial shade, this noble tree never grows to anything more than a mere bush, or at best a dwarf stunted tree. This, in some measure, accounts for the rarity of fine specimens being seen in this country. Although quite as hardy as any of its tribe, even when planted in an open situation with the best of soil, it will never rise to a tree. I have frequently seen single specimens planted on lawns, where they dwindle on for years in a stunted and unsightly state. In some situations, from being accidentally planted in a sheltered spot, we see a thriving tree, when it is much admired for its graceful habit. Any kind of soil that suits the Larch will answer for this, and in old pleasure-grounds there are always to be found situations suitable to it. In young plantations, or in making new ones, if it is planted amongst Larch and other fast-growing trees, it will grow nearly as fast as they, gradually thinning to give it room.

Cornus Florida.—Of all our flowering trees and shrubs few are more beautiful than this. Having small foliage and large flowers, resembling in shape the bloom of a large single white Clematis, and the involucres being of the purest white, it has a striking resemblance to Magnolia conspicua in miniature. I am not aware that it has ever flowered in England, and I cannot conceive any reason why it should not, unless, as in the case of the Hemlock Spruce, it requires a peculiar situation. I have always found it growing on the skirts of woods in the most sheltered and sunny places, frequently with the head projecting from other trees, and having the stem hid by their branches. I never saw it growing out singly in exposed places. It appears to be of very slow growth, reaching the height of from 15 to 20 feet. The young shoots are as flexible and small as those of the common Birch, and, consequently, ought to ripen well in our climate. As flowering plants could be easily had from almost any part of the Northern States, (on the banks of the Skuylkill, near Philadelphia, it is plentiful,) would it not be worth the trouble, by way of experiment, to import a few large flowering plants, which would soon prove whether it would thrive and flower in this country?

Cercis Canadensis.—Having seen this beautiful tree thrive and flower well, in the south of England, I am surprised it is not planted more generally than it is, as a more beautiful tree, both in flower and foliage, we do not possess; it is well adapted for clumps in park scenery, and when loaded with dark-purple pea flowers, it would form a fine contrast with the white Hawthorn. In its native localities it grows in thinly-scattered masses in open situations, and has a beautiful appearance when in flower.

Acer rubrum, or Scarlet Maple.—This tree, with numberless small scarlet flowers, has a very pretty appearance. In the month of April it is in flower, when not a leaf of any other tree is expanded, rendering its minute flowers much more conspicuous at that time than they would otherwise be. It seems to delight in swampy ground, exactly that in which our common Alder thrives, and if it was planted in such situations in this country, it would have a fine effect in spring, where few ornamental trees will grow.

Arbor Vitæ, or Thuja Occidentalis.—On the rocky shores of the Hudson, about a hundred miles above New York, are fine masses of this tree, each mass occupying more than an acre of ground. The trees were growing in the crevices of the bare rock, where there was not soil on the surface sufficient for a blade of grass to grow. So situated they are very luxuriant, being from 15 to 30 feet high, and feathered with branches down to their roots, which being wiry and matted, take firm hold in the rocks, and enable them to resist the fiercest storms. The dense foliage and branches prevent the sun from penetrating to their roots in summer, and preserves a sufficient quantity of moisture for their growth, even during the dryest and hottest seasons. Masses of Arbor Vitæ growing amid rocks and woody scenery, with here and there a neat white-walled cottage showing itself amongst them, had a very pleasing effect. This very ornamental section of Coniferæ (namely the Thuja, Cupressus, Juniperus, &c.) and Taxus, might be introduced with advantage on a large scale in ornamental gardening. The various species having such distinct forms and habits, might easily be so arranged and grouped in distinct masses on rockwork, as to have an admirable effect as a whole. Old exhausted stone quarries might be turned to account by planting them with this tribe, as they grow with little soil. Mounds of stone, or rubbish of any kind, might be raised and planted with them, either for the purpose of blocking out unsightly objects, or to give a pleasing variety to the landscape. Near the edge of ornamental pieces of water, mounds of the prostrate, and clumps of the upright species, would look well; in short, this group might be planted in different ways, and with good effect, both in public and private gardens.—*R. Reid, Noble Thorp.*

Home Correspondence.

Asparagus.—It appears to be a general opinion that new plantations of Asparagus, to have a reasonable chance of success, must be made early in the spring—not later than the end of March. I have reason to think that nothing is lost, if there is not a positive advantage gained, by deferring it to a much later period. In the spring of 1842, having occasion to make a new plantation of Asparagus, the ground was prepared by trenching it to the depth of two feet, and raising the whole surface one foot, with turfy loam, burnt clay, farm-yard manure, and the refuse of charcoal-pits. The beds were then formed three feet and a half wide, with the same space between them, allowing for two rows of plants on each bed. The plants were got up and planted with the greatest care about the middle of March; but, as I have frequently seen in other gardens, a great many of the roots perished. Now, there is nothing I dislike more to see than gaps in a bed of vegetables of any kind; and in the case of so valuable a vegetable as Asparagus, it is not only an eye-sore, but also a serious loss. It was, however, June before I could take any decided step to remedy the evil. I then procured several thousands of two-year-old plants, took up those that had not died, and, beginning entirely anew, had the ground dug over again, and re-planted with the fresh plants; and although they had tops eight or ten inches high, scarcely one failed. Many of the tops, indeed, withered and turned brown, but were in all cases succeeded by a fresh growth. The plants were taken up carefully, the roots were immediately covered with moss, and were kept moist until the moment before planting. In the course of the season the beds received several copious waterings with salt water. In the spring of 1843, before the shoots made their appearance, the beds were sprinkled with salt sufficiently thick to make them appear white, and the waterings with salt water were repeated several times through the summer season, and by September the shoots were five feet high. Since the 15th of this month (April, 1844) we have gathered daily a good supply of fine Asparagus from these beds. I should mention, that when the beds were planted the second time, the plants which were taken out (the remnant of the first planting) were put into two beds by themselves, where they grew very well, but not so strong as the others. It may appear that Asparagus planted in March, and having the whole season to grow in, must have a better chance of doing well than that which is transplanted in the middle of its growth; but I conceive that whatever advantages may arise from early planting, are counterbalanced by the ground being cold and wet, and the roots of the plants being so tender that many of them perish before the vegetative principle is excited; while at a latter period the case is different, as the juices of the plant are in motion at the time, and the soil being in a warm and genial state, is prepared to encourage immediate growth. I planted six more beds last year, also in the beginning of June, which, under the same treatment as the others, seem likely to do as well.—*G. Fleming, Trentham Gardens.*

Mustard Tree of Scripture.—To the very interesting paper on this subject, lately given in the "Chronicle," permit me to add the following remarks:—1st. That the "Salvadora Persica" is mentioned by Sir A. Burnes in his "Travels in Bokhara," vol. iii. p. 122: he adds that he thinks it is mentioned by Arrian. Having looked into Arrian for the passage to which Sir A. B. alludes, I can find only one that is applicable to the subject. In Lib. vi. cap. 22, Exp. Alexandri, he is describing the country of the Gadrosi, a country lying between the mouth of the Indus and the entrance to the Persian Gulf; and after mentioning the Myrrh and Nard trees growing there, he also mentions another tree, to which no name is affixed, which has a leaf like a Bay (δαφ'νη), a blossom like the white Violet but sweeter, which grows to the height of 30 cubits, is covered with strong thorns, and grows in places washed by the sea. The account of this tree is unusually long, and full, for a writer who does not abound in long or florid descriptions; and I presume that it is the passage which attracted Sir A. Burnes's attention. 2nd. I would observe that the language of Scripture, when employed on subjects like the present, is not to be interpreted with scientific accuracy; for it is written for the use, and adapted to the capacity of unlearned people: and further, its manner of expression is oriental throughout. Now, keeping these cautions in mind, we shall find that it is not necessary to suppose the "Mustard-tree" to be a large tree, or even a tree of second size; the language of the three Evangelists who mention it is nearly identical:—"It is the largest of all garden-herbs, and becomes a tree."—Matthew, c. xiii. v. 31. "It is the largest of all garden-herbs, and forms great branches."—Mark, c. iv, v. 32. "It increased, and grew up to be a tree."—Luke, c. xiii. v. 19. On which passages the following observations may be made. That the plant Σίναπι is described as a λάχανος, or "Olus," which is a "garden-herb;" that our translators of St. Luke have interpolated the passage by adding, and "waxed a great tree;" and lastly, that the expression of the "fowls of the air lodged in the branches thereof," also tends erroneously to add to the impression of the magnitude of the tree; as to our minds it conveys the idea of large birds, as eagles, vultures, storks, &c., whereas it literally means only birds, and, as this tree is described as planted in a garden (κῆπος), such small birds as would frequent the vicinity of man and his dwelling; but the "fowls of heaven," for such are the words, is the poetical language of the East. I would also observe, that it is not necessary to suppose that the "Mustard-seed" was the smallest of all seeds of any plant, flower, or minute weed, for such is not the case; but of any plant that would grow to the size of a tree; and those who heard this parable would thus far admit its truth, when they recollected that the other trees of Judea, or of the neighbouring districts, such as the Cedar, the Palm, the Olive, the Oak, grow from seeds or fruits larger in comparison with

this. I have also one more observation to make, which may not be deemed unimportant to the subject; that the word δενδρον used by the Evangelist, and translated "tree," is not so confined in its meaning, but is equally applicable to large shrubs, not only "Arbores," but "frutices grandiores;" as Virgil applies the word "Silva" to herbs in his "Georgics." My own opinion on the casual consideration of the expressions used in the parable is, that they have been somewhat misunderstood from the causes I have mentioned, and that this "Mustard-tree" may be considered as a "large shrub" growing from a small seed, where the small birds that frequent gardens, such as Lamartine describes in his "Palestine," could lodge for shelter or for rest. Had it been truly a tree, it would have been so equally, whether young or old, small or large, and would have at no time been with propriety called a "garden herb."—*J. Mitford, Benhall.*

Fuchsias.—These are much hardier than is generally supposed. In several gardens which I have visited in Ireland, I have seen plants, even larger than Gooseberry bushes, of Ricartonii, globosa, gracilis, and others, survive without the least protection in winter; and they flower freely during the summer and autumn months. It is surprising that these graceful shrubs are not more generally cultivated in the open air than they are. Nothing can surpass fine standard Fuchsias planted out singly on a lawn or in groups. I planted out last May the following:—Globosa, g. splendida, tenella, conica, Standishii, gracilis, g. multiflora, expansa, Riccartonii, grandiflora maxima, mutabilis, stylosa conspicua, Youngii, Buistii, and others. These, however, were cut down with the frost, but they are now, April 22d, growing luxuriantly; some of the shoots measure five inches in length. Their roots have had no covering whatever; the borders were rough dug, and fully exposed to the severity of winter. I would recommend Fuchsias to be planted plentifully in pleasure-grounds and flower-gardens, either as standards, which should be at least 4 feet high, or as bushes, along the borders of the principal walks, at equal distances; the standards should be planted 4 or 5 feet from the edge of the walk, and supported by neat stakes, after the manner of standard Roses. Put the dwarfer ones in front. Nothing can surpass a walk of this description. The standards may be grafted with the more dwarf-growing kinds; the operation should be performed in the common way, when the young wood is almost ripe. Fuchsias will grow and flower freely in any kind of soil and situation; but if it is desirable to have fine specimens, the ground should be a rich peat; it cannot be too rich for them. The plants which I put out in May last, into a highly-manured border, produced shoots from 3 to 5 feet in length, quite covered with flowers. If the winter should set in sharp, I would recommend that the standards be protected with a few Fir branches, or any old spare mats, which should be removed on all favourable occasions; the dwarfer plants placed here and there through the grounds, which have been killed by the frost, should have their branches cut close over by the ground; without further trouble they will come again in spring, as vigorous as ever. Plants which are intended to be planted out in spring should be struck in autumn under a handglass, in a mixture of peat and sand, in equal quantities. If peat cannot be easily procured any common loam will answer. As soon as they are rooted pot them off into any rich soil, and place them in a cold frame, giving air plentifully whenever the weather permits. By the end of April they may be planted out with safety. I am informed that Fuchsias are to be met with abroad having stems 7 and 8 inches in diameter; and that they grow and flower well within a short distance of mountains half covered with snow, where the temperature is as low as 37°, yet without the plants receiving any injury. This fact is of importance to cultivators of this interesting and graceful shrub.—*J. M'I., Hillsborough.* [It must be observed that our correspondent judges from the climate of Ireland.]

Glazing.—I beg to offer a method of glazing, which I have never seen practised but by myself, and I imagine it has only to be known to be generally adopted. Its advantages over the old plan are,—greater neatness, durability, economy, and cleanliness, as well as a freer admission of light. Instead of overlapping the panes, as is done in the ordinary way, I cause the glazier to cut each with a perfectly straight edge, and then to place them one before the other, so that they shall all fit exactly. When the light is completed the surface of the glass is perfectly level, and there are no interstices in which the dust, &c. can accumulate, or for the deposit of moisture. By this means one cause of considerable breakage, in frosty weather, is entirely avoided; and if a pane of glass is accidentally broken, as each pane is independent of the others, the fracture does not extend beyond the single pane. The whole is very firm and compact, and the glass is not liable to shake out, as frequently occurs in opening and shutting sashes. I first tried this plan about six years ago, on a 3-light Cucumber frame, and it answered perfectly. About two years ago I had one light glazed in this way, which has been in constant use ever since, and this also answers equally well. At first I applied a little white paint to each joining after the glass was fixed, thinking that some wet might possibly get through; but this I find is not required, and there is certainly much less "drip" by this than by the old method. In the light above mentioned there has not been a broken pane since it was first glazed, while those glazed on the old plan, and placed close beside it, are very much cracked, and several of the panes are ready to drop out.—*J. L. Snow, Swinton Gardens, Bedale.*

Azaleas.—I have 50 plants of different varieties of Azalea indica, many of which are large specimens. Only two plants have or will bloom this year; they are now making their wood, and are in a very healthy state. The flower-buds were formed, but they turned brown and fell off. This is the first year they have so disappointed me. The difference from their usual treatment was in not housing them until mid December, and in putting them in a dry Vinery that was close but cool, instead of an airy, cold greenhouse. We had no frost before they were housed, sufficient to freeze the earth in the pots. Can any of your correspondents inform me of the cause of their not blooming?—*Flora.*

Sphenogyne speciosa.—This is not hardy. I sowed some seeds last autumn, under a painted canvas cover: they had got about an inch high, when the frost we had on the night of the 2d Dec. killed them, although plants of Schizanthus pinnatus remained uninjured in the same situation.—*Geo. Thompson, Munden.*

Watering Out-door Plants. — In Numbers 28 and 32 of the *Chronicle* for 1843 are letters written on this subject by "J. L., Newburgh." In these the subject has been brought forward, without stating in what situation the plants were placed; but from his statements we may learn that they were fully exposed all day to the sun, and what, I may ask, would be the value of a morning's watering to them in clear dry weather? The dry air, together with the powerful rays of the sun, would dry up the moisture before mid-day, and, consequently, before the plants would have time to imbibe more nourishment than what would merely keep them alive; but even with plants exposed to the sun, evening watering would be more beneficial to them than when given in the morning, for the following reason, viz., that plants, during dry warm weather, always grow most in the night; and if they be watered in the evening, they have more time to store up nourishment, and, consequently, are better adapted to withstand the scorching rays of the sun. At night, when the temperature is lowered, organisable matter is formed, and the plant is extended, while at the same time it is supplied with more nourishment, to supply the place of that which has been expended in the forming of wood, &c.; but to give water in the morning would have a contrary effect; and, as before stated, the plants would receive only a scanty supply, from want of time to imbibe it; and that little would scarcely have circulated through the plant, before the cool night would arrive, when it would be deposited in the plant in a crude state. "J. L." states further, that the soil being made darker with the watering, favours radiation. From this I learn that he does not water his plants with cold well-water, for that would cool the soil down below the temperature either of morning or evening, and surrounding media would radiate heat into them. Then if he waters them with water always exposed in some tank, it will not be often far below the temperature of the night, and if the soil is made warm with the sun it will only radiate until it is cooled down to the same heat as the surrounding atmosphere, and that is what it ought to be. We have comparatively few very dry nights in this country to cause much evaporation, and what arises from the surface of the pots tends to invigorate the plants (in the absence of a damp atmosphere) rather than chill them; but "J. L." seems to think that because the combined influences of evaporation and radiation cause cold or frost, that, in whatever ratio it is given off, it must be in some degree hurtful to plants. By the same way of reasoning I might say, that, because water will drown plants, therefore they should have none at all. "J. L." states facts but draws wrong conclusions from them; he states at p. 556, that if you place a cup of water in a tray of vitriol or dry muriate of lime with a bell-glass over them, the powers of these two substances for attracting the vapour will be seen; and then he infers that the cup of water is like the wet pot or patch of soil, and the vitriol and muriate of lime like the dry soil or other objects surrounding. Now although the vitriol and muriate of lime may absorb moisture with a bell-glass over them, that is no proof that dry earth or other dry objects will do the same—on the contrary, the soil in the pots possesses in itself no power of attracting vapour; it is only when it is watered or comes in contact with vapour ascending from the ground, that it becomes any damper at all. The real question seems to be, Does the amount of vapour caused by the dry nights from evening watering tend to hurt the plants or invigorate them, or does it do neither of them? These remarks apply to plants set in the sun, where they ought to be, but they should be ranged in certain conditions, and not placed in the shade, as is often the case, where the sun never shines on them at all.—*A Practical Man.*

Rats.—(How to poison if it is convenient so to do, considering the disagreable smell afterwards under floors, drains, &c.)—I have several times practised very successfully nearly the same receipt I once observed in the "Gardeners' Chronicle." I take a portion of good sweet oatmeal with a piece of fresh butter, and a small portion of fine lump sugar, along with some nice fresh boiled Potatoes. These I mix and beat up well together until it becomes a tough paste. Forming this into boluses about the size of a filbert, I lay 4 or 5 of them on a crock or piece of clean slate, in convenient places near their holes. Repeating this feed for 2 or 3 nights, I then add a portion of arsenic to the said paste, and repeat the dose if the rats are not all destroyed, but by the first bait I have generally succeeded in clearing the whole. I have occasionally been very successful with arsenic mixed in new milk, or rubbed on a bit of lean beef. With one or the other of these remedies I have always been particularly successful in entirely destroying those artful vermin. During this last season, however, I had no sooner cleared away one batch than I was very quickly annoyed with another, more particularly in a succession Pine pit of a considerable length having hollow walls and pigeon holes; this is wholly heated by a body of fermenting materials inside and out; which I hope to see entirely dispensed with and turned to a more useful account. I resolved one fine day, all hands being busy, to get the whole of the Pine plants out; I threw the tan away from the walls inside, back and front, into a ridge up the middle of pit; I then took a quantity of 32 flower-pot saucers or stands, and placed them 5 or 6 feet apart, back and front, and into each of these I dropped about 2 ounces of flour of sulphur; a man followed with a shovel of red hot embers, and dropped a small portion into each pan of sulphur: this caused a stifling thick cloud of smoke which penetrated into every crevice, and I have neither seen rats or any other vermin there since. There may not be anything new in either of these methods, but I have myself been often perfectly satisfied with the good effects of each.—*Observer J.*

Rats.—(How to decoy, if you are troubled with only one or two old cunning ones used to drains, and having a bad convenience for setting a trap).—Procure some new bran, and throw two or three handfuls into a corner, where you could, after repeating this for two or three nights, and allowing them to scratch about at pleasure, set a spring trap or gin, as it is called by some, covering it well with the above material. I find this to be a never-failing remedy, and nine out of ten get caught by both fore legs, generally high up towards the shoulders, on account of their going eagerly to scratch among the bran as they were accustomed to do.—*Observer J.*

Birds.—In reply to a correspondent, who signs himself "X.," I would beg to observe, that it would be a work of great difficulty, and perhaps, after all, unintelligible, were any attempt to be made to describe the various notes of small birds which are now to be heard. Some, for instance the oxeye-tit (parus major), have several spring notes, varying much from each other in sound. The common wren and the hedge-sparrow sing beautifully at this season, and the migratory birds, which are flocking over to this climate for their summer residence, add daily to the music of our groves. Among these the nightingale, blackcap, and sedge-warbler, are the most celebrated songsters. The wryneck (yunx torquilla) is the bird which is known under the name of cuckoo's mate in many parts of the kingdom, because it makes its appearance here shortly before or much about the time that the cuckoo is first heard.—*Oswald Mosley.*

Deformity in the Timber of the Elm.—On March 14, at Stackpole Court, the seat of the Earl of Cawdor, an Elm-tree was felled, with a woody tubercular excrescence encirculating the trunk, the length of which is four feet five inches, and diameter three feet seven inches. The trunk's diameter below is one foot two inches, and above this excrescence one foot—a strong proof that the circulation of sap was to some extent checked at this point. It had a most singular and somewhat ornamental appearance when standing, being 12 feet from the ground; it contained nearly 33 cubic feet, and weighed 1 ton 2 cwt. 3 qrs.—*T. Davidson.*

Miscellaneous.—*Mr. Whiting*, of the Deepdene, near Dorking, finds Berberis trifoliata, trained against a wall, and protected by a mat on severe frosty nights, stand the winter without injury; it is now in bloom. He states that the flowers are inconspicuous, and come out in small clusters from the axils of the leaves on the last year's shoots.—— *A Subscriber* remarks that in the present month, and only up to the 27th, fifteen dozen of wasps have been destroyed in a garden in one of the northern counties.——*D. C. L.* inquires if there has been any peculiarity in this season, that may account for the unusual attack made by birds upon Gooseberries? He writes that he has lost nearly all his, and says that to the best of his recollection such a thing never occurred in the neighbourhood in which he resides before.

Societies.

HORTICULTURAL SOCIETY OF LONDON.

May 1.—The 35th Anniversary Meeting was held. From the report of the Auditors it appeared that the Society had succeeded in discharging their bonds bearing 5 per cent. interest, by the issue of promissory notes at 4 per cent.; and that the debt was reduced in the course of the year to the extent of 1428*l.* 5*s.* 1*d.*—Mr. ALLNUTT put some questions to the chairman respecting certain details in the arrangements for the exhibition of plants at the meetings at Chiswick: he was of opinion that a new regulation, which excludes plants that had been previously exhibited elsewhere, was one which required explanation; and he much objected to the practice of stamping their price on the face of the tickets issued to Fellows at 3*s.* 6*d.* each. The meeting being of opinion that mere details concerning the regulations for exhibition were not of a nature suited to discussion at the Anniversary meeting, the VICE-SECRETARY confined his reply to the chief heads of observation. He stated that no regulation existed by which plants previously exhibited were excluded. The words of the regulation were, that the Judges, in making their award, would *take into consideration* whether the plants to be judged had been exhibited previously during the season. The object of this rule was not to exclude previously exhibited plants, but to prevent the same plants taking prizes repeatedly, and to give specimens, produced at the Society's meetings for the first time, the advantage of their novelty. To what extent this would be carried would rest with the Judges, who are the persons to take all such cases *into consideration.* It was well known that certain plants were carried from Show to Show, and exhibited over and over again, thus gaining an amount of reward to which the degree of talent manifested in grow-

ing them by no means entitled them; in all such cases the prizes so gained were at the expense of other persons, which did not seem to be fair. With regard to the supposed case of two collections, or two plants, approaching each other nearly, without being absolutely equal, the Judges would be instructed in that case to give their award in favour of that which contained the largest number of plants not exhibited previously. The Vice-Secretary added, that papers would be prepared for the signature of the exhibitors, declaratory of whatever facts it might be desirable to bring under the notice of the Judges. With regard to the stamping their price upon the face of the 3*s*. 6*d*. tickets, it was a measure adopted for the purpose of preventing such tickets being sold for profit at an advanced price, and simply declared that their issue was one of the privileges of the Fellows. The conversation then dropped, and the meeting proceeded to the election of Council and Officers for the ensuing year, when Lord Prudhoe, Sir W. Middleton, Bart., and Sigismund Rucker, Esq., were elected new members, in the room of the Earls of Dartmouth and Ilchester, and Edward Barnard, Esq. His Grace the Duke of Devonshire was re-elected President; Thomas Edgar, Esq.. Treasurer; and Dr. Henderson, Secretary for the year ensuing.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.

Tuesday, April 30.—The fine weather rendered this meeting more than usually attractive, and brought together some good plants and gaily-dressed people. The Queen and Prince Albert honoured the Society by their presence, before the admission of general visitors. As usual at this season there was an abundance of Azaleas, some Cacti, a few Pelargoniums, a considerable number of garden-plants, with a good many common Orchidaceæ, not at all remarkable for fine growth, with one exception. We did not remark much novelty in any of these plants, for an Odontoglossum, called a new species, was merely the well-known O. hastatum; but we did observe, and with admiration, a most magnificent specimen of Cyrtopodium punctatum from the garden of Sir George Staunton. Noble as this plant is known to be in its native country, no such approach to its wild beauty had been observed in even the best specimens that have been flowered in this country; but here it realised all the expectations that ever were entertained of it, and more. The leaves were like those of a Palm-tree; the stems, clothed with those leaves, could not have been less than 6 ft. high, and as to the flowers they appeared in the brightest colours, and in quantities innumerable; in short, the plant reflected the highest credit upon Mr. A. Scott, Sir George Staunton's gardener. The other great display was a collection of Roses in pots, from Mr. J. Dobson, gr. to Mr. Beck, of Isleworth. It was impossible to imagine *good* gardening carried further; and we must confess that high as our expectations have been of what would be done in time by choice cultivators, with the first of flowers—the Rose—those expectations have been more than realised on this occasion; the health of the plants, and the magnificence of their bloom, were beyond all praise. These things we mention from our own observation; for the rest we refer to the account given by our reporter.—Among single specimens of Orchidaceæ was the magnificent plant of Cyrtopodium punctatum, above alluded to. The other Orchidaceous plants were not so remarkable. The collection from Mr. Hunt, gr. to Miss Traill, was the best. Among the finer of its specimens were Epidendrum crassifolium, in good condition; Oncidium Devoniense (?), very pretty; a good plant of O. ampliatum, in fine health; Calanthe veratrifolia, handsome; Phaius grandifolius, well grown; and some others, especially a good plant of Cattleya Forbesii. Mr. Bruce, gr. to B. Miller, Esq., sent a collection of six plants, including a small specimen of Cattleya Mossiæ, a large Maxillaria Harrisoniæ, together with a small but good Dendrobium fimbriatum covered with bloom. Mr. Kennington, gr. to F. G. Cox, Esq., sent Dendrobium nobile in tolerably good condition, a small Aerides odoratum; and among others, Vanda Roxburghi in a creditable state. Mr. Barnes, gr. to G. W. Norman, Esq., showed in the same class, as also did Mr. Redding, gr. to Mrs Marryatt; in the collection of the latter was Maxillaria Harrisoniæ in excellent health, and an Oncidium luridum which had a fine spike covered with dingy yellow blossoms. Among other single specimens of Orchidaceæ, was a Cyrtopodium punctatum, from Sir George Staunton's garden, which, although inferior to the one already mentioned, was nevertheless an excellent large well-flowered plant. Aerides Brookei in a lovely state, was shown by J. H. Schroder, Esq. From Messrs. Henderson, of Pine-Apple Place, were a few Orchidaceous plants not for competition.—Among stove and greenhouse plants, that from Mr. Hunt, gr. to Miss Traill, contained some exceedingly well-grown plants; in which, among others, was a remarkably handsome Leschenaultia formosa, well grown, and covered with bloom; Ixora coccinea in good condition; Chorozema cordata, large and well-grown; Erica Hartnelli in excellent health; with several other species of Erica, all favourably cultivated. Mr. Hunt likewise sent a large Pimelea decussata, compact and pretty; Hovea Celsi, dwarf and laden with flowers; Boronia serrulata, well managed; several fine Azaleas, an Eriostemon cuspidatum in good health, together with a handsome Tropæolum tricolorum, on a wire trellis covering the pot. A second large collection was from Mr. Cattleugh, of Sloane-street, Chelsea. It contained, among others, Cactus Ackermannii, a beautiful Azalea variegata, covered with bloom, a white Seedling Azalea with large showy flowers, Pimelea decussata, dense and pretty; Erica Willmoreana, good specimen; 2 Calceolarias, one named violacea maculata, a fine purple with small white dots; a dwarf bushy Pelargonium, named Gipsey; a Seedling Azalea, called Congesta, very fine rose-colour, along with another called Constantia, also a very fine Rose. A third collection was from Mr. Clarke, gr. to the Earl of Eldon. It contained, among others, a magnificent plant of Leschenaultia formosa, also Platylobium Murrayanum, trained on a trellis and finely grown; Boronia denticulata, and some other plants. Mr. Barnes, exhibited Boronia denticulata, well cultivated; Erica mundula, dwarf and bushy; a handsome Aphelexis humilis; Leschenaultia formosa, well bloomed; Corræa speciosa; a well-grown Erica odorata, and some other well-managed plants. Mr. Taylor, gr. to J. Coster, Esq., showed a collection of 20 stove and greenhouse plants, among which was Diosma capitata, low, and blooming profusely; a large bush of Cytisus racemosus; Azalea Smithii coccinea, densely covered with flowers; a large Chorozema varium, and other plants, generally well grown. Another collection of 20 was sent by Mr. Slowe, gr. to W. R. A. Baker, Esq., and contained some well-grown specimens. A collection of 20 was, moreover, shown by Mr. Cockburn, gr. to the Earl of Mansfield. Among the best plants were a beautiful Tropæolum tricolorum, trained on a wire trellis, a well-grown Epacris grandiflora, and several other plants, that indicated good management and skill. Mr. Redding, gr. to Mrs. Marryatt, exhibited a tolerable plant of Statice arborea. The nurserymen that showed in this class were Mr. Pawley, of Bromley, and Mr. Frazer, of Lea Bridge-road. In Mr. Pawley's collection, which was first, were a number of good specimens; among them Cytisus racemosus, several Azaleas, both of the red and white kinds, Tropæolum tricolorum, well managed, a fine bush of Pimelea decussata, Hovea celsi, dwarf and handsome, and a fine Boronia serrulata. Mr. Frazer's group comprised a few well-cultivated plants, chiefly fine specimens of Azaleas; a Boronia serrulata, well grown, and some others. In collections of 10 stove and greenhouse plants, 4 exhibited; viz., Mr. May, Mr. Kyle, Mr. Clarke, gr. to W. Block, Esq., and Mr. Brazier, gr. to W. H. Storey, Esq. In Mr. May's collection was a fine plant of Aphelexis humilis, a very large specimen of Erica Hartnelli, and several others, showing ample proof of good management. The collection of Mr. Kyle comprised some good plants; and beautiful specimens occurred in those of Mr. Clarke and Mr. Brazier. Mr. Frazer, of Lea Bridge-road, sent a collection of stove and greenhouse climbers, containing Tropæolum tricolorum, very fine, and Kennedya villosa, pretty; together with Hardenbergia monophylla, and several others, in good condition. Mr. Clarke, of Shirley, also showed in this class. Mr. Kyle sent 12 Papilionaceous plants, some of them well managed. In the collections of Heaths, some specimens were very well grown, and completely covered with bloom. The collection of Mr. May was the best. It contained an E. mundula, covered with bloom, grandinosa, in a lovely condition, and several others. Other collections, nearly as fine, were from Mr. Brazier, Mr. Dawson, Mr. Pawley, and Mr. Jackson. In collections of 6 Heaths, Mr. Frazer showed good specimens; as did also Mr. Clarke. An extra prize was awarded to Mr. Bruce for 6 Heaths, including E. Cavendishii, a pretty yellow kind, in excellent health. Mr. Barnes showed 6 Heaths. An extra prize was awarded to Mr. Pamplin, for a small E. Sprengelii.—The Azaleas made a fine display; the best was shown by Mr. W. Barnes, and consisted of some of the newer and better kinds; among which was A. variegata, particularly handsome. Mr. Catleugh showed some fine plants, as did also Mr. Gaines, of Battersea. In several collections we observed A. lateritia, particularly dwarf and fine.—Of single specimens, perhaps one of the finest plants at the exhibition was Erica aristata major; it was a beautiful dwarf specimen, from Mr. May. Another fine single specimen was Erica propendens, from Mr. Dawson, of Brixton Hill. In the same class Mr. Forrest, of Kensington, set up a good plant of Statice macrophylla; Mr. Hunt, a Gesnera, from Mexico; Mr. Paul, of Cheshunt, Tropæolum tricolorum; Mr. Fairbairn, of Clapham, Erica suaveolens; Mr. Jones, gr. to Sir M. Disney, a specimen Azalea; Mr. Smith, of Norbiton, a fine A. speciosissima; and Mr. Barnes, a red Azalea. A few other plants not very remarkable were also shown under this head.—A collection of British Ferns was exhibited, together with some Citrons and Oranges; the latter were from W. Jackson, Esq., from Devonshire, and were stated to have been grown on a south-east wall, with only a slight protection in winter.—*For Roses in Pots.* The first prize was awarded to Mr. Dobson, gr. to Mr. E. Beck (an amateur contending in the Nurserymen's class) for 24 specimens grown in slate pots. Great praise is due to Mr. Dobson for the skill displayed in the cultivation of those plants, and for the fine condition in which they were placed upon the tables. They were well grown, having abundance of luxuriant foliage in the finest condition, clean, healthy, and perfectly free from insects and mildew; each plant was adorned with flowers in every stage of growth, from the bud to the full-blown Rose, and though some of the sorts were not judiciously chosen in regard to colour, they all displayed very effective management. The sorts were: Phœnix, Cramoisie supérieure, Nouvelle Héloise, Belle Allemande, Zobiede, Madame Bosanquet, Triomphe de Luxembourg, Eliza Sauvage, Queen of the Bourbons, Hardy, Eugéne Dubourg, Hamond, Stadtholder, Therése Stravens, White Odorata, Armosa, Madame Newman, Miranda, and Caroline. The 2d prize was awarded to Messrs. Lane and Son. This collection was very fine in point of colour, and the sorts selected admirably adapted for exhibition; the plants were smaller, and inferior in condition, to the collection receiving the first prize. The sorts were—*Tea:* Lutescens grandiflora, Blush, Levison Gower, Belle Allemande, Hardy, Eliza Sauvage, Caroline; *China:* Abbé Newland, Cramoisie supérieure, Icteros, Eugéne Beauharnois, Fabvier; *Bourbon:* Queen, Thérésita, Phœnix, Armosa, Hybrid purp., Fulgorie, Queen Victoria, and W. Jesse. The prize for 10 pots was awarded to Mr. Slowe, gr. to W. R. Baker, Esq. These were dwarf standards, and the predominating colour white, or delicate pink: more variety in colour would have improved this collection. The sorts were, Nina, Haman, Hardii, Lady Granville, Bardon, Camilla blanc, Belle Margarite, Infidelité de Lisette, Princesse Héléne.

Several seedling Calceolarias were exhibited, but generally they have too strong a resemblance to sorts already out. Two were selected for their novelty, one named *Celebration*, white ground, with the front of the flower covered with blotches of a deep maroon colour; the other, named *La Belle Laure*, was a bright yellow covered with blotches of a light brown, leaving but little of the yellow visible; the flowers of both these varieties were large, sent by Mr. McOnach.—The 1st prize for the best collection of 12 Cinerarias, was awarded to Mr. W. Taylor; his sorts were Queen Victoria, large white; Azurea, Eclipse, King, Rival King, Favourite, Victoria Regina, Triumph, Lady Cavendish, Emperor, Miss Hankey, and Pride of Peckham; 2d prize to Mr. Ayres, gr. to J. Cook, Esq., Brooklands, Queen Victoria, Piper's Princess Royal; six seedlings—King, Rival King, King of the Blues, and Barceii. There were some seedlings exhibited, but no prize was awarded. A specimen plant, not for competition, named Goodeii, was shown by J. Dobson, gr. to Mr. E. Beck, Isleworth, grown in a slate pot; this variety was skilfully grown; the head was a mass of bloom, and the flower having a lively appearance, it formed an attractive object.—A collection of 12 Pelargoniums, grown in slate pots, corresponding in size to 24s were awarded the 1st prize. These were from J. Dobson, gr. to Mr. E. Beck, of Isleworth; the sorts were Meteor, Luna, Lord Chancellor, Evening Star, Susanna, Erectum, Martha, Zanzummin. The Purple and three Seedlings named Brunette, Charmer, and Sargeant; the plants were in vigorous health, short, compact, and full of bloom. An extra prize was given to Mr. Kyle, gr. to R. Barclay, Esq., for 6 large Pelargoniums; these were injured and bruised by their passage to the Gardens; the specimen of Sylph looked admirably.—*Seedling Pelargoniums:* Among the Seedling Pelargoniums three were selected by the Judges to receive a Certificate of Merit; these were from Mr. E. Beck, of Isleworth. 1st, *Master Peel*, under petals well formed, of a clear rosy-purple, terminating white in the centre, large dark spot in the upper petals, which are surrounded by a border of rosy-purple; the general form of the flower is good, and it promises to be of good habit and a free bloomer. *Lurida*, an attractive flower, the predominant colour of which is scarlet rose, broad under petals; the blotch wants a little more precision where it unites with the border: a flower of good general form, and rich in colour. *Chastity*, lower petals delicate pink, deep purple maroon blotch, leaving a narrow margin of pink round the upper petals; good general form.—*Seedling Rhododendrons:* 1st prize, Mr. Smith, Norbiton; these specimens were uncommon in colour, ranging from lemon to deep buff; the flowers were large, and finely spotted in the upper division of the corolla.—An extra prize was given to Mr. J. Wells, gr. to W. Wells, Esq., of Redleaf, for cut blooms of Seedling Rhododendrons; the flowers were particularly fine; the tints of them ranged from white, through various degrees of pink and rose, to a deep rosy crimson; the heads of bloom large and compact, and several of them finely spotted. In a collection of Seedlings from Mr. Gaines we noticed one curious variety named *Mirabile;* the buds are of deep rosy crimson, and the colour of the flower varies according to its age, the last state being perfectly white, and beautifully spotted in the upper part of the flower.—*Seedling Azaleas:* 1st Prize, Mr. Pawley, for *Carminata*, a large deep-coloured flower; 2d Prize, Mr. Falconer, for a lighter variety named *Emmelina*; 3d, to Mr. Catleugh, for *Erecta*, a flower of fine form and great brilliance of colour; and an extra Prize to the same grower, for another variety named *gloriosa*, of a bright rosy crimson colour, and a Certificate of Merit was awarded to Mr. Smith for 3 greenhouse Azaleas, named *Pallida*, *Elegans superba*, and *Rosea superba*. 2d Prize for 12 greenhouse Azaleas, Mr. Smith, of Norbiton, named Azalea alba superba, coruscans, punctata decora, impressa, mirabilis, ardens, semiduplex coccinea, amabilis splendens, phœnicea alba, bicolor nova, and magniflora plena.—In Pansies, for colour, size, and sorts, Mr. Brown's stand was decidedly superior to the other competitor. The 1st Prize was awarded to his collector, and the 2d to Mr. Goode, Ponder's End; the stands of Mr. May, and Lane and Son, being disqualified on account of the numbers not agreeing with the specification in the schedule, Mr. Brown's being the only stand having the names attached. We subjoin the list:—Brown's Arethusa, Ceres, Bella, Curion, Cinderella, Fancy, The Prior, Maid of the Mill, Modesty, Viceroy, Crœsus, Cotherstone, Elect, Vivid, Superb, Prospero, and Hannibal. Thompson's Regulator, Jehu, Rufus, Miss Stainforth, Beauty of Bucks, Warrior, Captain Boldero, Prince Albert, Eclipse, King's Exquisite, Sulphurea elegans, Cook's Mulberry Superb, Purple Perfection, Woom's Rob Roy, Bragg's Jewess, Superb, Hooper's Duchess of Beaufort, May's Imogene, Kitley's Bathonia.

COUNTRY SHOW.

Ipswich Cucumber Society, April 26.—This was the 2d Show for the season. An excellent Show of Cucumbers was put up for competition. The judges, as usual, gave complete satisfaction in awarding Prizes according to the standard of the Society; and, as will be seen by the list, the best and most handsome fruit measured 10 diameters. After the business of the day, at 5 o'clock, the exhibitors, judges, and officers of the Society dined together, and spent a happy evening. It was proposed by Mr.

Wild, the secretary, that a valuable piece of Plate be given in February next for the best brace of Cucumbers; to be competed for only by the winners of First Prizes, at any Show during the present year.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

LINUM TRIGYNUM (Three-styled Flax). (*Stove Perennial.*) Linaceæ. Pentandria Pentagynia.—Seeds of this attractive species of Linum were received by Major Francis, Madden-hall, and, with many other seeds and bulbs, were presented to his brother, R. Hall, Esq., of Narrow Water House, Warren Point, Ireland, in whose stove it flowered about December, 1837. It has, however, been long known in the stoves of this country; for we find, in Dr. Smith's Exotic Botany for 1785, a figure of it, which is stated to have been taken from a plant that flowered a short time previously in the stove of the Hon. Charles Greville, at Paddington. Although it will thus be perceived that the plant has been cultivated in England for more than fifty years, it is at present but rarely met with; yet, as it produces its flowers during the three winter months, and as those are highly beautiful, very abundant, and remain expanded a long time; and as the plant is likewise very easily propagated and cultivated, it merits a much more extended circulation than it has yet received, and is undoubtedly a most desirable and valuable stove plant. It grows freely in a compost of equal parts of heath-mould, decayed leaves, and light loam, provided it be carefully potted, and judiciously watered; for, as the roots are small, they cannot endure any immoderate supply of water. It may be readily multiplied by cuttings of the half-ripened wood, planted in the same or a rather more sandy soil, and plunged in a gentle hot-bed, under a hand-glass. In a communication which we received from Mr. Hereman, while gardener to R. Hall, Esq., he appears to consider it the Turnera elegans of Otto, and also that it is a South American species; but it is obviously identical with the L. trigynum figured in the Botanical Magazine, t. 1100, where it is distinctly stated to be an East Indian plant; and as we possess specimens of it in full flower at Chatsworth which were introduced from the East Indies by Mr. Gibson, his Grace the Duke of Devonshire's collector, the fact of its being a native of the East Indies is placed beyond all doubt; and though some eminent Botanists have been led to question whether this plant is really a species of Linum, it has never, we believe, been separated from that genus. The generic name is derived from the Celtic word Llin, signifying a thread; most probably in allusion to the well-known useful purposes to which some of the species are applied. The specific name is peculiar to this plant, on account of its flowers being furnished with three distinct styles.—*Paxton's Magazine of Botany.*

GARDEN MEMORANDA.

Ruston Hall, Norfolk.—This place, which is the seat of D. Gurney, Esq., is situated two miles from the seaport of Lynn, and commands a fine prospect of the surrounding country. It is kept in good order, and no expense is spared in adding every novelty to the excellent collection of plants already here, that is worthy of cultivation. At this place are two Vineries that were erected and heated by Weeks, about three years since; they are very perfect constructions of the kind. The Vines are in the "highest possible degree of health," and although this is only the second season of bearing, they are producing a fine crop of fruit. They are very creditable to the gardener, Mr. Thrower. The Cucumbers and Melons are also good, particularly the former, several of which measure from 20 to 27 inches long. There is a fine collection of Heaths here, which are well grown. Mr. Thrower does not practise the one-shift system in the cultivation of any of his plants. Pelargoniums are as well grown here as at any place that I have seen round London; two specimens, viz., Rising Sun and Sunshine, are very fine. Mr. Thrower has succeeded in raising some good seedling Cinerarias. There is likewise here a good collection of Pinuses, to which a great number has been added this season.—*J. Stewart, Crimplesham.*

Miscellaneous.

Poisoning by Darnel (Lolium Temulentum), with the Means of Detecting this Seed when mixed with Wheat Flour.—M. Rustini was charged with the analysis of some bread which had rendered ill twenty women employed in a silk manufactory. These women, after having eaten it, were seized with somnolency, with a universal convulsive tremor, accompanied by coldness of the extremities. When this bread was presented to him, it was gray, compact, heavy, and of a disagreeable odour, and reminded the author of the examples of adulteration by means of alum or sulphate of copper with Wheat Flour; but he did not find the characters which these salts present. He then thought of the lime and of the arsenic which agriculturists employ in the operation of liming; then he proceeded to analysis, and he found in the bread a greater quantity of lime than is ordinarily met with, which he attributed to the water used in its preparation. He then asked for a sample of the flour, thinking that it might contain some organic principle which might have been altered or disguised by the action of fire; but he experienced considerable delay in procuring it, and in the meantime the manager of the manufactory in which the women were employed went to the baker, and, after reproaches and threats, obtained from him the avowal that the miller had sometimes furnished to him flour containing Lolium. The physician, thinking that he recognised the symptoms of poisoning caused by this substance, administered emetic and emulsions, and all the symptoms were soon dissipated. The affair rested here. However, says M. Ruspini, in my quality of pharmacien, although I was no longer professionally engaged to make investigations relative to this case, I immediately began to make experiments in order to distinguish pure Wheat flour from that mixed with Lolium. My method of analysis is simple, and capable of being put in practice by persons unacquainted with science. It consists in digesting for half an hour alcohol at 35° at the ordinary temperature, with half an ounce of Wheat flour; the more pure it is the more limpid will the alcohol remain; then it will take only a more or less deep Straw colour, according as the flour contains more or less of the pericarp and embryo passed through the sieve, owing to the carelessness or design of the miller. The alcohol will be coloured yellow by dissolving the peculiar resin which the Triticum bybernum contains, and which resides in the pericarp. The taste of the alcohol thus coloured will not, however, be disagreeable; it will even be rather sweet. If, on the contrary, alcohol be digested with flour mixed with the seeds of the Lolium, the spirit of wine will immediately acquire a characteristic greenish tint, which will gradually become deeper; the taste of the tincture will be astringent and disagreeable to the extent of exciting vomiting. Evaporated to dryness in a porcelain capsule, it will give as a product a greenish-yellow resin, possessing the same characters as the tincture, but more powerful, and so evident as to leave no doubt as to the adulteration in question. Some reflections follow concerning the infamy of such a fraud, and the necessity of punishing it, by publishing the names of the bakers who allow it, in the public journals. In a note, the author says that the arsenic used in the liming is decomposed by the earth, and that the plant cannot preserve any trace of it. In a second note, he announces that this year, the rains having been very abundant, before the putting forth of the ears, all the bad herbs, particularly the Lolium, grew abundantly in the fields, rendering it necessary to sift the corn with much care.—*The Chemist.*

Broccoli.—There is now exhibiting in the window of Messrs. Warner and Warner, Seedsmen, 28, Cornhill, two heads of Chappell's New Cream Broccoli. These weigh 9lbs. each; they are in good condition, and are fair specimens of that variety.

Wax.—A theory has been promulgated by the justly celebrated Professor of Chemistry at Giessen, Dr. Liebig, that the constituents of the food of animals, when taken into the system, during the processes of digestion and nutrition, undergo a peculiar modification, the result of which is the production of substances, through the agency of special organs, totally different in the proportions of their chemical constituents from those of the materials from which they have been derived. A proof of this change was pointed out by Liebig as afforded in the production of wax by the honey-bee, as in the experiments of Huber, recently confirmed by Gundlach, in which the bees were fed only on sugar. But it was objected by many distinguished chemists that there was no direct *proof* in these experiments; as the constituents of wax might have been collected by the bees before they were confined for experiment, and stored up in their own bodies, or that the wax might be derived from the fat of their bodies, which, in the proportions of its ultimate constituents, is very similar to wax. To put these objections to the test, MM. Milne Edwards and Dumas jointly undertook to repeat the experiments. They first ascertained by analysis the quantity of fatty matter in the bodies of a given number of bees, and the quantity of waxy matter accidentally contained in the honey with which they were fed during confinement. The result of the experiments proved that the quantity of wax produced in a given period by each bee exceeded very nearly three times the combined amount of waxy matter contained in the food, and of fat in the body of each bee at the commencement of the experiment, besides a large amount of fat still contained in its body at the close. These experiments most incontrovertibly prove that the constituents of the wax could not have pre-existed in the bodies of the bees, but that wax is a true formation, the result of changes which the constituents of the food undergo, through the agency of special organs, during the process of nutrition.—*Annals of Natural History.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

SOME of the more free growing plants that were potted early will now want another shift, and you may give them more pot-room now; this is also a good time to try the one-shift system with young or lately-propagated plants. Many young plants nursed in pits through the spring will now be getting too high, or the pits may be wanted for other purposes; remove them to the stove, and, for the first week or two, imitate the pit-culture for them as far as your house will allow. Keep them more shaded than the rest of the plants; syringe them twice a day, and keep them as far from the ventilators as you can.

Conservatory.—Now that the season is so far advanced, that many of the older kinds of plants often wintered in conservatories may be removed to temporary shelters, no plant, except in flower, or a fine specimen, ought to find a place in the conservatory from this time to the end of September. As the spring Heaths get out of flower, remove them to cold pits; if they are young plants, this is the best time to prune them. I have seen men in the best nurseries cutting off the tops of young Heaths going out of flower by handfuls. As soon as the growth of forced Rhododendron arboreum is nearly finished, remove them to a cool shaded place, as this and many of its hybrids are easily induced to make a second growth, and consequently produce no flowers next season. Keep all plants well watered, and in good shapes.

Greenhouse.—Encourage your Greenhouse plants to make a rapid growth now; keep the house warmer and more moist than is generally done, and see that this moisture does not deceive you in watering; many pots may look wet on the surface, and yet be dry below. Train, pinch, or prune them as circumstances may direct; and, above all things, keep them perfectly clean.

Forcing-pits.—Most of the spring-forcing plants are now done with in these pits. Roses will now bloom in any close house, pit, &c. There are many plants, however, that may be more or less forced for the conservatory all the summer through, especially those called intermediate, or half-stove plants. Camellias, Azaleas, and Rhododendrons that have been early forced may be grafted as soon as the young wood begins to get hard. Before you throw away an overstock of seedlings raised this spring, ascertain whether they can be used as stocks for others of the same tribes, of which you may be short. Of all modes of propagating rare plants, grafting is the easiest, and requires less time and attention.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

The importance of grouping plants in flower-gardens according to their complementary colours has been so repeatedly insisted upon, both in leading and other articles, since this Paper first started, that it would scarcely be worth while to advert to it if it were not for the great accession of subscribers during the present year. The leading principles of this system of management are—contrast and symmetry. Contrast such as will be produced by placing the complementary colours pretty close together, as scarlet with white, purple with yellow, orange with blue, and so on with the various shades of these colours *ad infinitum*; and symmetry such as will result from every bed having a corresponding one in form and disposition, and these beds planted with flowers of the same colour. In borders which are seen throughout in the length and breadth of them, the colours should be repeated at regular intervals, as scarlet, white, purple, yellow, blue, orange, and so on to the end; and where beds are placed on Grass, and without a corresponding one near them, they should be belted with the complementary colours, as blue with an orange margin, purple with yellow, and scarlet with white; or as green is the proper contrast for scarlet, beds of that colour may be left without a margin, and white, under such circumstances, used as a distinct bed. Where beds are on gravel, which is a warm colour, cold colour should be the most used, as blue, purple, and white, which for Floricultural purposes takes the place of green; or if warm colours must be introduced, it is indispensable that they be margined with cold colours. In large gardens where there is a great preponderance of green, as large lawns or trees, extensive lakes, and more especially if the trees are sufficiently large to throw considerable shade upon the scenery, nothing but warm colours should be used, as scarlet, orange, and yellow; and these should be planted in large masses, and stand out prominently in the foreground of the scenery, and especially near the water. Whoever has walked through the metropolitan parks will have noticed how much more cheerful is the aspect of the lake in St. James's than it is in the Regent's Park or Kensington Gardens; and this is because the water is surrounded by gravel, which gives warmth to the scenery; and were the islands in the lake in the same park planted with double Furze, white Broom, and the Judas-tree, instead of being studded with little heaps of flints, as an apology for rock-work, and which resemble so many oyster-grottos, we should then have in a few years one of the most splendid scenes that can well be conceived. With these sunny days, and parching east and north-east winds, it is impossible to get on with anything in the Flower Garden; but Necessity's stern command compels me to transplant upwards of 100 large shrubs and trees, some of them from 20 to 30 feet high, and in full leaf, and strange to say, not one in ten of them has indicated any check from their removal, although they have now been transplanted nearly a fortnight. In the Flower Garden look to Annuals, which will suffer much if not watered; and get all in readiness to begin planting out directly we get a soaking of rain; but before we get rain it would be madness to think of planting anything out.

Reserve Garden.—Watering and thinning the young plants is the principal work at the present time, but double Primroses, Polyanthuses, &c., which are out of bloom, and being removed from the Flower Garden, must be parted, and planted in rich soil in a shaded situation, and deluged with water.

American Garden.—This is a good time to tie out or peg down the branches of American plants, so that the young shoots may take the right direction when they begin to grow. In high and exposed situations the plants must have water, or they will be unable to expand their blooms properly.—*W. P. A.*

III.—FLORISTS' FLOWERS.

If extreme hot days and frosty nights are favourable to the perfect development of Florists' Flowers, then the last ten or twelve days have been singularly propitious, for we seldom have such Aprils as the past. Exhibitions of the Auricula are taking place, and from most localities we hear favourable accounts; and at some Shows in various parts, we have seen splendid blooms of the following first-rate flowers:—Page's Champion, Oliver's Lovely Ann, Waterhouse's Conqueror of Europe, Lee's Colonel Taylor; the last of which, though not exactly to our mind in some of its properties, was, nevertheless, extremely fine, the pips being larger than usual; and that first-rate purple Self, Barker's Nonsuch, was in excellent condition, though it appears scarce in collections. As we observed last week, all blooming plants ought to be under awnings, in a northern aspect; keep the pots free from weeds. The green fly is often

troublesome at this season, getting into the hearts; examine them daily, and remove the insects with a camel hair-brush. *Polyanthuses* require some attention just now, shading, watering, &c.; watch seedling plants, as the blooms pass through their various stages of development and decay; and observe whether the lace or edge keeps its colour (which ought to be similar to the centre) to the last. This is an essential property, often overlooked by young beginners. *Ranunculuses.*—Many people are watering, a practice I would not recommend (if the beds are properly made), as, I am persuaded, it has at the present time, an injurious tendency. Top-dressing with very rotten cow-manure is far more beneficial. *Tulips.*—Some genial showers would be most acceptable to these splendid flowers. In addition to the heavy complaints of the number of bulbs which do not flower, there are a greater proportion of buds with distorted petals than usual, both attributable to the injury they sustained from the spring frosts of 1843, few collections having escaped. Keep the beds free from weeds, and as soon as the buds get sufficiently forward, let the top cloths of the "shed" be put on. *Carnations.*—Cultivators will suffer this spring, who have layers in late, it being more unfavourable than usual. Where the soil has not been well examined, the Florist will often have the mortification of finding his layers gone "past redemption," and on pulling them up, he finds a wire-worm at the root. Layers in pots require well attending to with water, &c. Pink-beds ought to be surface-dressed, in the way recommended for Ranunculuses. Reduce the number of shoots for blooming, according to the strength of the plants, and put small neat sticks to those which are retained.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—It is scarcely possible to keep the atmosphere of the fruiting-pit moist enough during this fine weather. Slight shading during the hottest part of the day will enable the giving of front air to be dispensed with. It is not desirable to give front air if it can be avoided, as it produces a current towards the back apertures, which acts injuriously on the foliage of the plants. Liquid manure may be administered freely this clear weather, whenever the plants are dry; but it should not be given in a muddy state. For successions, see former Calendars.

Vineries.—When young Vines, bearing their first or second crop, have reached the top of the rafters, stop the leading shoot, and continue to stop the laterals till the fruit is fully swelled. Now is the best time in the year for planting out Vines in a new border, as they do best if growing freely at the time of planting out. If the border was made in the winter, it should be fresh turned up. If, after planting, the roots are covered with a little warm litter, they will receive no check from turning out, but advance so rapidly, that they will be sufficiently strong to bear next year. We have here two Vineries in which the Vines were so treated last year, and this season there was an average of 16 "shows" to each Vine; which number, however, was reduced to 5 or 6. The Vines are remarkably strong, and the bunches promise to be very large.

Peach-house.—Give plenty of air to Peach-trees when the fruit begins to change colour, and keep a low temperature, in order to prolong as much as possible the time of maturation of the fruit.

Fig-house.—Keep the syringe in use as much as possible. It is only for a few days, while the fruit is ripening, that syringing is injurious; and it need not be discontinued long. The foliage of the Fig continues a long time on the plant; it is therefore more necessary that it should be kept clear of insects. A little additional attention will be amply repaid by the trees continuing productive till October. Plants which are confined at the roots will require liquid manure, if they are bearing freely, and the wood is short-jointed. Where this is not the case, clear water will be better.

Melons.—Look well to the thinning out of laterals and small sickly leaves from the origin of the branches. It is upon the latter that insects generally make their first appearance.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Where water is a scarce commodity many shifts must be resorted to in this dry weather. The best substitute for heavy watering is to mulch with short grass, between the rows of advancing crops. This will save much time and labour, even where water is plentiful, and the utility of the measure may form an extenuating plea to those who delight in finely-raked borders. When this keeping the water in the ground system cannot be adopted for want of materials, the next best method is to keep the surface of the ground well and often stirred. Simple as the operation of watering is, few things are worse performed. One good watering that will saturate the soil, provided the surface is mulched or stirred afterwards, is worth a hundred mere sprinklings, because the one watering will often be sufficient, while the many waterings are generally prejudicial. In the one case the roots are discouraged from coming to the surface; the dryness of that surface prevents rapid evaporation of moisture from below, and the roots are therefore enabled to absorb freely to supply the exhaling foliage. In the other case, surface-roots are for a time encouraged, but are speedily checked, as the sun quickly causes the moisture of the surface watering to evaporate; that watering had previously stopped for a time the capillary action of moisture in the soil; the energies of the lower roots of the plants have consequently become relaxed, and before they can again be roused into activity the plant droops and often dies.

Sow *Peas, Garden Beans, and Kidney Beans*, for succession; *Scarlet Runners* for the main crop, giving the drills a good soaking, and covering on the top with dry soil. *Transplanting.*—The only thing that can be done is to prick out Cauliflower, Lettuce, &c., on beds of light soil, with rotten dung beneath, so that they may be moved with balls when favourable weather arrives.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—The time for commencing to fell and peel Oak, or other trees, should be carefully attended to. Try frequently on some tree, to ascertain when the bark separates freely from the wood, in order that the best part of the season for such operations may not be lost. It would be very beneficial to plaster over the cut part of the stools or young trees that are felled, with fresh cowdung, or at least round the outside edges, to prevent the bark separating from the wood by the action of the sun and wind.

Coppice.—Where the felling of poles or other trees to be peeled is to be done this season, the foregoing remarks are applicable, when a strong vigorous succession of young coppice wood is desired.

Young Plantations.—Now is the best season to train young trees. Thin out some of the strongest side-branches where they are too numerous; take some close off, and shorten others, according to directions formerly given.

Nursery Work.—The dry sunny weather and frosty nights have been very trying to newly-planted seedlings and trees of all sizes and kinds; if, therefore, the precautions and directions so repeatedly given have not been strictly practised, many failures may be expected.—*W. B.*

State of the Weather near London for the week ending May 2, 1844, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

AURICULAS.—*R. A.*—Very little sun is necessary for ripening the seeds of the Auricula; let them have plenty of air; a north border is a good situation. The seed will be ripe the beginning of August; it should be sown in February, in soil composed of bog, loam, and cow-manure three years old.*

BOOKS.—*McL.*—De Candolle's "Prodromus" is in Latin.

BURCHELLIA CAPENSIS.—*Inquirer.*—I am aware of the scarcity of this; but if there was a demand for it as a stock for the Luculia, nurserymen could supply it under 10*s.* a dozen. The readiest way to propagate it is by cuttings of the roots and by seeds, which may be had from the Cape in any quantity. They grow best in very sandy loam and leaf-mould. Gardeners generally complain of their Burchellias growing too fast, and like the Luculia it requires close pruning to keep it in good shape.—*D. B.*

CAMELLIAS.—*A Subscriber.*—You may cut down these and place them in a pit upon a damp bottom. They should be kept rather close until they have made their wood. The roots may be reduced in August; and not when the plants are cut down.‡

CHINESE DWARFS.—*E. C.*—Thanks; but pray send us a leaf, that we may be sure there is no mistake.

COUNTRY SHOWS.—*A Scotchman* writes to inform us that his Scotch blood is up at an observation made at the end of a report on the Forres Society, published by us last year; he says that the said report "has caused an ill-feeling to arise among individuals, to the total disruption of the Society;" and he demands an explanation. The paragraph which has exploded among the good people of Forres is the following:—"This is taken from a printed copy with which we have been supplied; but we give up in despair the correction of the blunders in the names." To prove that our statement is unfounded, our correspondent adds a printed report of the Show as published in some Northern Paper. In this report there is certainly not error enough to justify our censure, and if it had been sent us instead of that which we received, it would have passed without remark. We can only recommend our hot-blooded friend to take care in future that the right reports are furnished us; what we did receive was most discreditable either to the education of the person that copied it, or to the care of the printer who set it up. If "A Scotchman" will look to that part of our report in which the plants from Cluny Cottage are mentioned, he will see that the printed copy now sent us could not be the one to which we alluded; for at that part Origanum Dictamnus is introduced, which is not mentioned in "A Scotchman's" report. We have made this rather long explanation in justice to those who have possibly been blamed for the blunders of other people, and because we do not know our correspondent's address. As to the Members of the Forres Society having quarrelled with each other about our half dozen words of censure, we cannot do them the injustice to suppose such a thing possible.

CYPRIPEDIUMS.—*A. H.*—C. spectabile is well known to be quite hardy; so is C. pubescens. It is occasionally imported from Canada. All such things are rare, and difficult to procure when one wants them.

DISEASES.—*E. T. O.*—There can scarcely be a doubt that your Portugal Laurels have got their roots into soil of bad quality; either undrained, or otherwise unsuitable. No insect is at work. But consider whether this is not possible, notwithstanding the healthiness of others near them.

GARDEN POTS.—*S. R. P. S.*—There is no restriction as to what the size of pots may be in which plants are exhibited at the Garden of the Horticultural Society of London, except those in which Pelargoniums and Calceolarias are grown. The list given at p. 233 of last year's *Chronicle* will afford every information respecting sizes. They are measured from the outside §

GRASS-SEEDS.—*C. T. A.*—We recommend for an acre of lawn on a light soil the following:—Cynosurus cristatus, 6 lbs.; Anthoxanthum odoratum, ½ lb.; Avena flavescens, 1 lb.; Festuca duriuscula, 2 lbs.; F. ovina, 1 lb.; F. pratensis, 2 lbs.; Lolium perenne, 10 lbs.; Phleum pratense, 1 lb.; Poa nemoralis sempervirens, 2½ lbs.; P. trivialis, 1½ lb.; Lotus corniculatus, ½ lb.; Medicago lupulina, 1 lb.; White Clover, 10 lbs. As a manure, nothing will beat Liquid Guano for such a place, especially if you add muriate of lime at the rate of ¼ cwt. per acre.‡

HEATING.—*Machaon* asks for information about the "Olmstead Stove." Can any one give it? We do not know the stove.

HOLLIES.—*A. S.*—We never heard that the best way to get up a stock of common Holly is to stick the cuttings each into a Potato, and to plant them at a proper depth; and we doubt the fact.

HYACINTHS.—*G. S. W.*—You are correct in stating that from the commencement of the flowers to the topmost bell the stem should be hidden in a finely-blown specimen; the other matter in dispute, we of course cannot judge of. Double flowers should compete with double, and single with single: it was an error to mix them together.*

HYDRANGEAS.—*F. W.*—Your plants, in the open air, require exposure to sun and deluges of water in summer, and good matting up in winter. If the old wood be killed, the young shoots will flower notwithstanding. We should not expect them to bloom on a north border.

INSECTS.—*B. Chilo.*—The beetles attacking your Swedes are the Turnip fly (Altica nemorum). You will find their history, and the best means of destroying them in the Journal of the Royal Agricultural Society, vol. ii. p. 193.—*R*——*X. Y. Z.*—Your Larch trees are infested with a species of Aphis, called Adelges Laricis, I believe. To suggest a remedy is impossible.—*R.*——*H. K.*—The Beetles eating your Rose-leaves are the Otiorhynchus tenebricosus, a Weevil, which you will find described in the *Gardeners' Chronicle*, vol. ii. p. 316.—*R.*

MANURES.—*J. K.*—Cow-dung is the best manure for Rhododendrons. We have had no experience with guano for them.‡——*H. D.*—Neither sample is at all like the superphosphate of Mr. Lawes; whether or not they contain phosphoric acid is a question that must be ascertained by analysis, which we cannot undertake. No. 2 is more like pitch.

MISTLETOE.—*H. B.*—Your ripe berries may be used now. They will grow freely on the Apple-tree. Make an incision in the bark and insert a berry or two; then tie a little damp Moss over them; they like to be kept rather moist until they begin to grow.‡

NAMES OF FRUITS.—*Thomas Lang.*—Winter Pearmain.‖

NAMES OF PLANTS.—*G. O. B.*—Pinus Pinaster, Pyrus spectabilis.——*A Subscriber.*—Blechnum occidentale, Pteris serrulata.§——*H. T.*—Yellow Banksian Rose.——*Burry.*—It appears to be either Iris pumila, or the yellow variety of it; but the flower has lost all its colour and shape.¶ ——*T. Durison.*—Hakea saligna; neither from the Cape nor the Mauritius, but from New Holland.——*B. T. S.*—Your two species of Melittis are undistinguishable, either because they were smashed in the letter-bag or because they are alike.——*J. M.*—Carex cæspitosa.——*J. S.*—How does your Ranunculus differ from bulbosus? It certainly has much paler flowers than usual, but we see no further difference.——*E. T. O.*—Epidendrum leiobulbon we think; if not, the true name will be given next week.——*J. R.*—1 Grevillea sericea; 2 Templetonia retusa; 3 Mimosa marginata; 4 not in flower; 5 Hovea purpurea; 6 a Smilax; 7 Malva Munroana; 8 Erica recurvata.

PEACH-TREES.—*Omikron.*—We think we can explain the cause of your misfortunes, and will endeavour to do so next week.

PELARGONIUMS.—*Winton.*—Your case is very vexatious. We are as much in the dark as ever about the spot-disease of these plants, unless it is cold and over-watering. We will publish your case next week, and so revive the question.

PETUNIA PUNCTATA.—*W. M.*—The bloom received of this variety agrees with the favourable opinion expressed of it in the autumn of last year.

ROSES.—*Limerick.*—Beauty of Billiard will strike from cuttings, but it is more easily increased by layers. Lelieur strikes freely from cuttings. They may be put in as soon as the young wood is ripe enough.‡——*J. K.*—Give your plants plenty of manure. Probably the best would be compost of Guano and six parts or less of cow-dung. Any Roses will grow on your bad soil if richly manured; without manure none will thrive. Farmyard manure may be substituted for cow-dung; but we prefer the latter.

TREES.—*S. W.*—A tree begins to grow when the buds begin to swell; in other words, a tree makes woody fibre as soon as the buds are observed swelling. You may easily satisfy yourself of that by watching the common Lilac.——*A Subscriber* will find his advantage in dusting his seeds well with superphosphate of lime: caustic-lime has also been found useful.

VERBENAS.—*J. C. F.*—Bridesmaid, light-blue lilac; Burleyana, pink; Speciosa, orange; Boule de feu, vivid scarlet; Howardiana, pink; Prince of Wales, flesh-colour; Conspicua, light purple; the other three we are not acquainted with; they most probably are new.*

VINES.—*A Subscriber.*—It is quite unnecessary for Grapes to be exposed to the sun; all that is required is that the leaves of a Vine should be so exposed, and that most fully. Nature makes the bunch of Grapes hang down, and overshadows it with leaves. Why should we oppose her will?——*An Old Subscriber.*—Since other plans of stopping the bleeding of the Vine fail, we advise you to try Sir John Sebright's Cement, which consists of four parts rosin, one part bees-wax, and one part fine brick dust, melted and well mixed together. This will stop bleeding in Vines and other plants.——*Beta.*—Most undoubtedly you may remove your Vines with safety, by adopting such means as you describe; and at such time Cover the roots well with litter for the first winter.——*T. H.*—Four sorts for an early Vinery may be, the Black Hamburgh, Black Prince, White Sweetwater, and Royal Muscadine. A south aspect.‡——*K. L.*—As you can give no air at top, the extremities of your Vine-shoots have, in all probability, been checked in consequence of too high a temperature, alternating with cold, to which they will be liable, owing to their position close to the glass. You must prevent their contact with the latter.‡

MISCELLANEOUS.—*Zealous.*—We do not know the Botanical name of the New Zealand Stinging Nettle.——*F. W. C.*—Without seeing your Cucumber-bed it is impossible to be positive as to the disease of your leaf. It is, however, probably caused by cold currents of air acting on very tender foliage; but it may arise from very different causes. Is not the soil too moist for the degree of light to which the leaves are exposed? If you water your plants largely, and do not enable them to relieve themselves from it by exposure to sunlight, they are likely enough to be thus affected ——*J. L.*—Take common "oil varnish," such as is employed for in-door work by the paper-hangers and painters. Thanks for charcoal.——*Tyro.*—Double flowers will produce seeds whenever a few stamens and a style or two are untransformed—*e. g.*, Roses.——*S. Snape.*—We will do what you suggest.——*W. H. G.*—We have no experience about manure for Chicory; but should, in the absence of farmyard manure, try guano mixed with soot, or peat, or cinder-siftings.——*Simplex.*—We thank you much for your hint, and will look to it. But we do not see the ground of your complain. Would it be giving you too much trouble to ask you to be more explicit?——*W. I.*—There is little or no difference between the Tropæolums you mention. The one is just as good as the other.‡——*T. L.*—See Insects above.‡——*J. L. S.*—Pray send your paper on Potting.——*A Subscriber.*—We cannot answer your inquiry about the place where Pine-plants may be bought. We never name sellers.

SEEDLING FLORISTS' FLOWERS.

CALCEOLARIAS.——*O. P. Q.*—There is nothing uncommon in your seedling: it is very small, and the outline at the bottom of the flower too much indented.*

CINERARIAS.—*J. D. V.*—Light disk, white ground, with crimson purple picotee tip: the flower is a good shape, and it forms a desirable variety in this class.*——*Borealis.*—Your seedling, rich purple with black eye, is a fine and handsome variety.*——*Anon.*—In both varieties the petals are too narrow and thin.

FUCHSIA.—*D. C.*—Neither in size nor colour is your flower equal to many of the new varieties.*——*Borealis.*—Your seedling Fuchsia wants brightness; the sepals are narrow, and have a faded appearance; the divisions of the corolla are too narrow; they unfold, and are poor in colour.*——*J. K.*—In the specimens you have sent of Pondii, the sepals do not appear to expand sufficiently; in other respects it is a large, bold, and richly-coloured flower.*

MIMULUS.—*R. H.*—Your seedling is a good flower, but not superior to others that have already appeared.*

PANSIES.—*Y. and E.*—No. 1 is a large flower of good form, white ground, blue purple upper petals, and broad margin of the same round the lower petals; the petals meet well above the eye; a good flower. 2 is your best flower, the eye large and intensely dark, ground light buff, belting purple, upper petals the same; a brilliant and striking flower. 3, neat and compact, but not equal to others of the same colour. Of the yellows 4 and 6, the latter is the best; the eye is finer, and the colour deeper and more uniform; they are both rather deficient in form and substance, and have a common look; the want of a blotch in the lip to form the eye is a great deficiency; and 7, though a flower of fine form and good eye, wants substance.*—*A Lady.*—The *Brunette* did not arrive in good condition, the blooms being shrivelled up; damp Moss appears to be the best material for packing them in, but neither in form, size, or substance, is your flower to be compared to the Selfs now in cultivation.*——*T. O. G.*—*Scrutiny* is a very fine flower, large, well-formed, and of great substance; ground white, eye fine, rich purple up-petals, with a broad belting of the same round the lower petals; the side petals meet well above the eye, and the form of the shield made perfect.* ——*Y. and C.*—*Tippo Saib*, a large richly-coloured purple Self, of considerable substance. *Grand Duke*, fine eye, yellow ground, purple upper petals, and a broad belting of the same colour round the lower ones; a large well-formed flower of good substance. *Compacta.*—There are two points in this flower which injures it; the lines running into the belting from the eye gives it a blurry character, and the weak manner in which the belting terminates above the eye; in other respects it is a very good flower. *Grandis*, large flower, with white ground, deep purple upper petals, the belting is irregular, but uniform on the three petals; eye good, but rather rough on the edges of the petals.*——*J. O.*—The yellow Self, and the one with a dark eye, are good flowers. The other specimen is deficient in the centre; we are not acquainted with the names; they appear to be poorly cultivated from their size, and the material in which they were packed was not sufficiently damp.*

ERRATUM.—In our report of the Exhibition of the South London Floricultural Society, the exhibitor of the Seedling Polyanthus spells his name "Burnard," not "Barnard," as inserted.*

*** As usual, many communications have been received too late

IMPORTANT TO AGRICULTURISTS AND OTHERS.

ANALYSES OF SOILS, MANURES, &c. are conducted by Mr. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), No. 5, A., Hawley Road, Kentish Town.

N.B. Gentlemen instructed in Agricultural Chemistry. The course will comprehend the Elements of Analysis.

WRIGHT'S STACK PRESERVER. — Hundreds of Stacks of fine Hay were saved from spontaneous combustion or discoloration in the neighbourhood of the inventor, by the use of the above invaluable instrument. The article may be seen, and bills obtained, containing testimonials to its value from experienced Farmers who have for many years proved its efficacy, at J. WRIGHT'S, Manufacturer, Ongar, Essex; J. and G. DRANE, Ironmongers, London-bridge; and of any Ironmonger in the country. Price, in box, with lock and joints, 2*l.* 5*s.*

The Agricultural Gazette.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, May 8 Agricultural Society of England.
THURSDAY, May 9 { Agricultural Imp Soc of Ireland. Highland and Agricultural Society.
WEDNESDAY, May 15 Agricultural Society of England.
THURSDAY, May 16 Highland and Agricultural Society.

FARMERS' CLUBS.

May 6 { W. Market. Yoxford. West Hereford. | May 7 . Framlingham.

SOME weeks ago we spoke of the *actual* loss sustained by many farmers in permitting the liquid manure from their stables, feeding-stalls, and pig-styes to run to waste; and of the great *danger* of loss to which those of them exposed themselves who allowed this waste to run into their horse-ponds. This is a subject to which we shall not cease directing the attention of our readers until we know our remarks to have had a practical tendency. The completest exposures of bad management in farming are rarely self-applied; and there are two reasons for this: one of them—the natural tendency of the mind to self-justification—is cleverly illustrated in the admirable work on Waste Manures, lately published by Mr. Hannam,* the perusal of which we most cordially recommend to our readers, and especially to such of them as may be conscious that their practice under this head is capable of improvement. Mr. Hannam, who has probably had more experience than any other British farmer of the practical value of our home and foreign fertilisers, was well qualified to make this, the first public attempt to draw attention to the individual and national losses consequent on the careless management of farm-yard manures. We earnestly recommend his book to the attention of Agriculturists; the greater part of it—it is a small octavo volume—may be made practically useful by each of its Agricultural readers, and the rest, on the waste manures of towns, is highly deserving of public attention. We quote as follows:

"Although the economy of these manures is of the highest importance to the cultivator, whose aim is to produce much and cheaply, in few cases is their preservation attempted, much less accomplished. There are those, however, who are apt to attempt an excuse for their carelessness on this head; but, as is generally the case with men who are anxious, when in a difficulty, to save themselves only, they impede each other. Thus the agricultural Triton says, 'This candle-end and cheese-paring economy may do very well for small farmers, to whom a small saving is a great gain, and whose labour, being their only capital, may be safely and profitably invested in attention to this matter. On a farm like mine, however, where every operation is on a large scale, and where everything is done on a system, we cannot attend to these petty cares,—they would interfere with matters of more consequence.'

"On the other hand, the minnow—the man of small means—is apt to say, 'Yes, undoubtedly, this is an interesting question to the large farmer. He must indeed waste as much manure as would serve for a farm like mine. As for me, however, I have but such a small place, and keep so little stock, that it is not worth while to make any fresh arrangements, or to take the trouble of altering my plans.' Thus does each cover the beam in his own eye, while he exposes the mote in his neighbour's; forgetful that, by each exposing the other, we arrive at the truth, and conclude that if the business on a farm be so extensive, an improvement in the system would be equally great; and that if the size of another be small, the effect of a small saving would be more apparent. This the intelligent practicalist sees. 'If,' says he, 'by judicious economy, I save manure for one extra acre on a farm of 50 acres, on one of a thousand I gain, by similar management, manure for 20 acres; and the value of the saving is as great to one farm as to the other. What is saved is gained really, in this case; for if the land which may be dressed with the manure saved be left unmanured, I injure the crop and diminish the fertility of the soil; or if I buy manure, I increase the crop but injure my purse. In either case, I am calling to Jupiter for aid, and am not putting my own shoulder to the wheel; I am paying for that extra produce, which I might by judicious economy obtain at no cost, and am in fact farming badly; since, if I neglect the waste manures on my own farm, and buy no other tillage, I am not producing as much as possible, and if I buy manure, I am not producing as cheaply as possible.'"

Another cause of the general inefficacy of exposures of mismanagement in this branch of farming, lies, we think, in the fact that a very inadequate idea is generally held by farmers, especially by those occupying only small tracts of land, of the real value of such parts of their produce as have not been bought or are not saleable for cash in the market. The expense of horse-keep, for instance, though often the subject of calculation by farmers' clubs, is rarely kept in mind by the members of such clubs in the full money-value which certainly belongs to it. If it were, more care surely would be taken to economise the labour of the horse on most farms, not merely by cheapening its food, but by yoking it advantageously to efficient implements more easily worked than those in general use, and more care would also be taken to economise stable manure, which besides labour is an important produce of horse-keep. The sum spent in stable management, though large, would thus be productive of a more profitable return. The value of manure, generally an unsaleable commodity, is another point upon which inadequate views are often held; at least so we must conclude, so long as we see in some districts heaps of it left for months on waste land, till they sink to one-third of their original size, and get thoroughly washed of all their soluble ingredients. Perhaps if, as in some well cultivated parts of this country, the farmer were required on entering his land to pay a full value—3*s.* to 5*s.* per cubic yard—for all the manure left by his predecessor, he might be induced habitually to entertain a higher opinion of its value, and thus to take means for carefully preserving it.

In order to attain this desirable object, we purpose soon laying before our readers two series of statements, the one detailing all published or known *experience* of the value of such portions of manures as are generally wasted—the effects which it has been ascertained they have on the growth of various crops; and the other, detailing the results of inquiries into the composition of that which is thus lost, by comparing which with the composition of various saleable fertilisers, guano for instance, we shall be enabled to put a money value upon the losses which many farmers sustain in this way. Do not let any one wait, however, till he sees what sort of case we make out against him, before he adopts means for economising the manures which he may now suffer to waste. We can safely pledge ourselves to *prove* the great loss he now sustains, and he will greatly profit by at once putting a stop to it; if, however, he require first to be convinced of this, let him purchase Mr. Hannam's little book upon the subject, and read it, and in the meantime we quote for his consideration the following passage from it:—

"I know many farms where the horse-pond is the receptacle of the drainings from the yard, and many villages where the street-sewer receives them. It fell to my lot to witness a fox go to ground in a farm-yard not 100 miles from this place. On examination, a drain was found which led from the centre of the fold to the street-sewer. This drain was large enough for a hound to enter, yet all efforts 'to bolt' the fox were futile, as it was found that there were branch drains from the sewer communicating with most, if not all, of the farm-yards in the village. I was curious enough to trace the main drain to its terminus, and found that a large pond was the place of deposit for the urine, and other fertilising matters, made in the cattle sheds and yards of so many farms. Not one of the parties who cut these drains, I should say, ever considered that by doing so, he cut a hole in his pocket which drained his purse as effectually as the manure heap. The case I mention is but one of many which may be met with daily, and which, too numerous to be particularised, are on that account often overlooked, though they are not the less worthy of consideration. For instance, I have little doubt but that as much fertilising matter is annually deposited in the pond, to which I have alluded above, as would pay the whole of the poor's rates of the parish in which it is located."

* "The Economy of Waste Manures, a Treatise on the Nature and Use of Neglected Fertilizers," by John Hannam, Author of various Agricultural Prize Essays. Longman, Brown, Green, and Longmans.

AGRICULTURAL IMPROVEMENTS.

I WILL give you a succinct account of my draining operations at Tiptree-hall Farm. The land is of such various qualities and so particularly qualified thereby for the retention of both top and spring water, that the Essex people considered it never could be improved even to become of tolerable goodness. About two-thirds of it was a strong yellow loam subsoil, in a state between putty and bird-lime, according to the season, here and there mixed with a hodge-podge of stones, to which its attachment was so affectionate that there was no separating them, and it was only by the constant use of water that the land drainers could get their spades in or get rid of this adhesive substance; at intervals might be found veins of silt (the reverse of adhesive), and here and there the soil would assume a rusty appearance, indicating iron, with a bluish or slaty character; then a patch of gravel occasionally amongst the loam, in which would rise a small weak spring, sufficient, however, to ruin the crops in its immediate neighbourhood. Over this subsoil and between it and the cultivated soil, was a hard, dry, and impervious pan, formed of the subsoil, but hardened and rendered solid by the heat of the sun and the constant action of the plough-sole. The soil itself partook in some considerable degree of the nature of the subsoil, being, however, ameliorated by mixture of manures and by cultivation. Still so great was the fear of the wretched subsoil that the pan was never disturbed, consequently, there being but nine or ten inches of cultivatable earth with an impervious basis, a dry summer burnt all up, and a wet one ruined the crop by rotting the roots. A showery season was the only suitable one for this description of land.

Now, however, after draining, in the short space of a few months, we are subsoiling to the depth of fourteen or six-inches, and working it like a garden; the water having left it, and the frosty air following the water, it is as mellow and friable as could be desired. In fact, during the last month, whilst our neighbours were unable to move, we were harrowing on our Wheat and Beans as in a rich garden, the earth crumbling down after the drill like sand, very much to the astonishment of the tenant and labourers; and this after so much carting and disturbance, and so much of the subsoil thrown up, that two months previously it was thought a whole summer would hardly suffice to condition the soil. The drains cross, at a very acute angle, the slope of the land; they are four yards apart, with a leader to every fourscore rods—the leader being rather deeper than the other drains, but not wider. Still, as it never runs full, it proves in practice my subsequent proposition, that "the filtration of water, in strong soils, is far inferior to the velocity of its passage through the drains." Each acre contains twelve score rods, and costs ten pounds, requiring 3200 pipes and 360 bushels of stones.

The style of drainage applied to this part of the farm is as follows:—1st, a double turn of the plough takes out nine inches; then a narrow spade (sufficiently wide to admit the drainer's foot) takes out ten inches; then comes a still narrower spade (fourteen inches long, three and one-eighth wide at top, and one and a half at bottom), which removes thirteen inches more—making the whole depth from the surface thirty-two inches. The drain being well cleared out, we first fill in the drains, to the depth of ten inches, with clean gravel-stones, and then place, on the top of these stones, a drain-pipe, thirteen inches long and three inches wide outside, having a two-inch bore. This fits so exactly into the space made by the last or narrow spade, that it not only rests on the stones, but binds against the sides of the drain, thereby preventing the stones being choked by the superincumbent earth, but also forming the earth above it into an arch; which in the stronger soil would, it is presumed, retain its form even if the pipe were broken or decayed. As this is a plan of my own, and contrary to the entertained opinions, that the tiles should be at the bottom, I will give my reasons for so doing. 1st. It is cheaper. 2d. It is more durable, and less liable to choke. 3d. There is a larger area of space for the escape or filtration of the water; this I consider of the utmost importance. It is evident that the filtration of the water must be according to the area of the pores presented to the air in the drains.

This might be illustrated by saying, it is of little use having a large passage unless you have enough sidedoors to admit a sufficient number of passengers to travel down it. The pores, in contact with air, which are constantly admitting the water by its superior gravity, should form a superficial area equal to the sectional surface of the unoccupied space in the pipe or drain (reduced to an area); the velocity of passage in the drain being certainly, in a general way, equal or superior to the velocity of percolation. It must be considered, that in dense subsoils, the continued winter rains expand the particles and render filtration more difficult—especially during the first year or two after drainage; therefore, I prefer deep and narrow stone drains, protected from earth by a pipe over them, because they afford ready access to a large and porous surface; filtration going on both on the tops and sides at the drain.

I would observe, that even on the recently drained strong loam, but little surface water ran away; most of it percolated, except in cases of the ground being frozen hard, and of very heavy and sudden rains. It appears to percolate tolerably clear according to the season—but on this point my observations must be more extended. On cutting across some of the drains that had been made six months, the stones were found to be washed as clean as the gravel in a brook.

The other third of this farm was the reverse of the first two thirds, and required an entirely different system of drainage. It is mostly black, sandy, and boggy soil, with numerous springs rising at various points where obstructed by perpendicular walls or veins of dense clay or hard gravel—sometimes both.

The drainage here has been effected by a person named Pearson, from Warwickshire, a man of extensive knowledge and ability in this department of drainage, who I understand has essentially improved Lord Digby's estates by his judicious sub-draining of the springs. His plan is to take his fall from the lowest point, and gradually work up to where the spring shows itself, having previously ascertained the whereabouts by digging, and by those plants that invariably show themselves over a spring. As springs are generally attended by sand-beds, a single drain will often lay dry a large extent of ground. In one case where there was a swamp of four acres, the drain was opened at two feet, and continued in a trench till it reached eleven feet in depth; the sand boiling up at intervals like water in a caldron, of course it was necessary to shore up the sides; and when his level was accurately taken, he commenced laying his pipes on hay (two half pipes, four and a half inches diameter were put together, being internally nine inches by four and a half), but so strong was the force of the water, it was necessary to have two strongly-made iron skeleton arches with wooden sides, about 30 inches high, and the width of the drain two feet. In these arches the pipes were laid, and firmly loaded to the top of the arch with soil to keep the

pipes from being forced up by the boiling waters and sand; when loaded the arches were removed by a lever, the mouths of the pipe being carefully stopped with hay, till the next length of pipe was laid in the next arch (two always being in use, one in front of the other).

The result is, that one such drain laid four acres of bog perfectly dry (having a smaller spring carried over or across it); the first drain runs permanently 30,000 gallons every twenty-four hours, and several others nearly as much. It has laid our neighbours' wells dry, a quarter of a mile off (being in a bed of sand, below their level). The land (which has been double spitted) is now always perfectly dry, although previously dangerous for cattle, and entirely worthless.

In conclusion, allow me to say, I have derived most valuable information in draining from those excellent and standard works on Agriculture, "Stephen's Book of the Farm," "Loudon's Encyclopædia of Agriculture," and "Morton on Soils." Ample and satisfactory evidence and matters of fact in every branch of draining may be found there. It is with extreme regret I frequently see money completely wasted by placing tiles without soles, and pipes without stones, and temporary and imperfect draining by bushes. That soil in a few years becomes absolutely much worse than it was originally, for when the drains choke, there is a much larger accumulation of water, to the destruction of the crops.

I hope that in time to come Farming will be treated as a science, and that there will be as much uniformity in cultivating land as there is in manufacturing cotton. That can only arrive by our young farmers deriving a uniform Agricultural education—the mechanism for which does not at present exist.—*I. J. Mechi.*

TRIALS WITH SULPHURIC ACID AND BONE DUST FOR TURNIPS, IN 1842 AND 1843.

THE Secretary of the Monmouth Farmers' Club considering it to be of the greatest importance to raise a good crop of Turnips at the least possible expense, has much pleasure in annexing to this years' report a statement of his own and other persons' trials with sulphuric acid and bones, and other manures; and, although these trials have been made upon light soils, he hopes that the suggestion made in the *Agricultural Gazette* as to the probable value of sulphuric acid and bones on clayey soils will be verified; so that it may in the fullest sense prove to be as Mr. Pusey says,—"That these trials of the Morayshire Farmers' Club and the Duke of Richmond afford good hope that this, the most important saving which was ever held out in the use of manure, will be found generally applicable."

Trial of sulphuric acid and bone dust with other manures, upon a worn-out arable field of a sandy soil, sown in the beginning of Aug., 1843, with improved stone Turnips in lots of a quarter of an acre. The ground was ridged up at 24 inches, the seed drilled on the ridge, and hoed out to 8 inches; the Turnips were horse-hoed three times, and hand-hoed twice. The measure, weight, &c. are all calculated per imperial standard: one perch of each lot was pulled, topped, and weighed on the 8th January, 1844. The expense and produce per acre are as under:—

No. of Lot.	MANURE PER ACRE.	Expense per Acre. £.	s.	d.	Produce per Acre. Tons.	cwt.	qr
1.	15 yards of Fat Pig's Dung, rotten	3	0	0	15	2	3
2.	3½ bushels of Bone Dust and 80lbs. of Sulphuric Acid	1	0	6	13	1	1
3.	40 bushels of Coal Ashes saturated with human urine in winter 1842-3	1	3	0	12	12	3
4.	20 cubic yards of road scrapings, mixed with 280 gallons of human urine, and twice turned over in 1842	2	3	6	10	12	2
5.	2 cwt. Guano, mixed with 12 bushels of pure Charcoal Dust	1	15	0	10	5	3
6.	7 cwt. Urate	2	1	6	9	11	2
7.	20 bushels of Bones (half dust)	2	14	0	9	1	1
8.	6 bushels of Bone Dust and 20 bushels of Charcoal Dust	1	3	0	8	17	0
9.	4 bushels of Bone Dust and 20 bushels of Charcoal Dust	0	18	0	8	17	0
10.	16 bushels of Bones (half dust)	2	4	0	8	2	3
11.	15 yards of common Straw Dung, half rotten	1	10	0	6	13	1
12.	40 bushels of pure Charcoal Dust	1	0	0	5	4	1

The Turnips on lot No. 2, sown on the 8th of August, came into rough leaf before those on any of the other lots. It is worthy of remark that Nos. 1, 2, and 3, are now (the 8th of January) in a very growing state, the tops weighing nearly five tons per acre. The writer begs to call the attention of farmers to the plan used in lot No. 3, for every one can, if they please, adopt that by having all the chamber lye, soap suds, &c. collected in the house thrown daily upon the coal ashes, by which it will be seen that the crop nearly doubled lot 11 with 15 yards of common dung. The ashes were not kept under cover, but no doubt that would be an improvement, and if a quart or 4lbs. of oil of vitriol diluted with 5 or 6 gallons of water, or 10 lbs. of calcined gypsum, or half a bushel of charcoal dust was sprinkled over the saturated ashes once a week it would prevent the ammonia flying off. In addition to the trial lot No. 2, there were nearly three acres with sulphuric acid and bone dust in the same field. To cover this quantity of ground with the solution two men and two horses were at work for nearly two days, with a water-cart that holds 200 gallons, the water being about 300 yards from the field; but when the men are accustomed to the work and the water is within the above distance, from two to three acres may be done in a day. Almost every farmer to whom I have shown the crop, or spoken upon using sulphuric acid, has exclaimed against the great trouble; but surely it is worth a little extra trouble if we can raise a larger crop of Turnips with this mixture, now costing 13*s.* 8*d.* per acre, than with 20 bushels of bones, nearly four times the expense. Should Mr. Pusey's plan of mixing with earth, or the Duke of Richmond's by using only half the quantity of water, answer, it will remove this objection by saving the trouble which is so much thought of. As to a water-cart, every farmer can make one by putting a hogshead upon a pair of cart wheels, and thus provide himself with a most valuable machine for taking out his liquid manure, &c. The autumn and winter having been so very favourable for the growth of Turnips, the crops would no doubt have been much heavier, if a larger sort of Turnips had been sown. Another thing which operated very strongly against the crop, was the field being hill-side; the hail and rain accompanying the dreadful thunderstorm of the 9th of August, washed much soil and manure from each lot, so that in the steeper parts of the field there were but few Turnips; so severe was the storm, that the seed that had been planted the day before was actually washed out of the ground, to the extent of about an acre, of the part manured with the sulphuric acid, so that not a single Turnip made its appearance: although, however, this part was not ridged up again and replanted for 9 or 10 days, the Turnips grown upon it were fully equal to those on lot No. 7, having 20 bushels of bones per acre, thus showing that the solution had not been all washed away with the soil. The fact that the storm did not wash away the solution in the last acre sown (although in the steep parts of the field the other manures except the dung were nearly destroyed) shows that perhaps half the quantity will be sufficient, and that the great chemist Liebig, to whom we are indebted for this valuable discovery, is right when he says that a much smaller quantity of bones and acids (viz. 40 lbs. fine bone-dust and 20 lbs. sulphuric acid per acre) will produce a good crop of Turnips. In the *Mark Lane Express* of January 3rd, 1842, a farmer signing "N. E., Scotland" says he has used for Turnips sulphuric acid and bones at the rate of 60 to 70 lbs. bone dust and 30 to 40 lbs. sulphuric acid per acre, for some years, and it has in every year produced a larger crop than 30 bushels of bones. The present price of sulphuric acid is about one penny per lb. in carboys or bottles of about 200 lbs. each. The writer will procure and deliver at Monmouth or Chepstow during the first week in May any quantity at one guinea per bottle, provided the order is given before the middle of April; and as he feels most anxious that trials upon all descriptions of well-drained soils, whether sand or clay, should be made in this district, he will be most happy during the ensuing season, to give attendance gratuitously to any gentleman or farmer who may wish for his assistance.—*Pilstone, near Chepstow, February*, 1844. [This is extracted, with Mr. Purchas's permission, from the Report of the Monmouth Farmers' Club. This gentleman's offer in the last paragraph should be followed by the secretaries of other farmers' clubs: the price of a useful article is often less the cause of its not being used, than a little trouble in obtaining it.]

STEAMING APPARATUS.

THE subjoined plan of a steaming apparatus we find in general use in the north of Ireland, and we think it might be of service to the Agriculturists of the south. The boiler is an American invention, known under the name of "Jenning's American Patent;" the steam is generated in it with great despatch,—the water rising between the two inner cones (which are of malleable iron), so that all the surface exposed to the flame is surrounded with water, thereby insuring safety from cracking or explosion. An important advantage in this apparatus — the invention of Mr. Robinson, at Lisburn, Ireland — is the power of heating the water before entering the steam-boiler, as shown at 2 in plan, in a vessel surrounding the flue, and by which the supply can be self-regulated. In the plan, 4 cooking vessels are shown which may be used for any kind of food for steaming, either separate or mixed; the vessels are supported on a bench made of wood, as in plan, but any number and size of vessels may be attached, or the steam may be applied to various purposes of heating. The great advantage of this apparatus, over all others which have come under our notice, is the simple manner of its construction; and, being portable, it may be fitted up in any situation, either under cover or out of doors. *Reference to Plan:*—1, steam-boiler; 2, the water-vessel, in which the supply is heated before entering the boiler; 3, flue; 4 4 4 4, cooking-vessels, made of white iron (or, for farm purposes, of almost anything—casks answer very well); 5, bench on which the vessels are placed, and kept secure by being inserted in grooves, as in plan; 6, steam-pipe, which may be made to any length, according to the number of vessels to be heated; 7, vessel for a supply of warm water; 8, pipes conveying the steam to the vessels, the steam entering through the holes in the bottom of the vessels, as in plan; 9, safety valve; 10, inside safety case, made of malleable iron; 11, gauge-cocks; 12, extra branch-pipe, which may be applied to different purposes; 19, cock which regulates the supply of heated water to the boiler; 14, pipe conveying the supply of water to boiler; 15, cocks which regulate the supply of steam to vessels.—*J. McI., Hillsborough.*

ON ASCERTAINING THE WEIGHT OF CATTLE BY MEASUREMENT.

THE importance of proceeding on correct principles in the rearing and feeding of live-stock, is now so generally admitted, as to require no illustration. With the feeder, it is especially important that a disposition to arrive at early maturity should be encouraged and secured, so far as the acceleration of this desirable property is within his reach. In this respect much has been done of late, but much still remains to be done. Early maturity is not attainable without high feeding uninterruptedly, from the birth of the animals until they have attained to maturity; and this can only be attained where a superior system of cultivation is practised, as it is there only that a proper supply of food is available at every period of the season. In fertile districts the aid of cultivation is not necessary to produce the required supply during the summer season, as this is obtained from the pastures; but even in these cases it is by no means rare to find stunted animals, resulting from the winter treatment. The finest cattle are not by any means universally found in the most fertile districts, especially when early maturity—one of the best tests of excellence—is taken into account; so that improved cultivation is not only followed by superior crops, but also by a superior description of live-stock; and in the mixed system of husbandry of the United Kingdom, it must be recollected that by far the greater portion of the proceeds of the farm is obtained by animal products.

But, however desirable it may be to possess a proper knowledge of the correct principles on which the treatment of live-stock should be founded, it is also important to be able to ascertain their value when ready for market, or to ascertain their progress while feeding. Experience and accurate observation are obviously the essential requisites for obtaining this knowledge; but it is to be kept in view that the opportunities of the farmer in this respect do not bear a comparison with those of the butcher, with whom he has to deal. The latter has a never-failing test, by which he can try the accuracy of his calculations, in having the animals afterwards killed and weighed; and thus, from time to time, he is enabled to modify his views, and correct his more imperfect estimates—opportunities which the farmer rarely or never possesses. Long experience, indeed, will enable the farmer to form a tolerably correct estimate as to the value of his cattle when slaughtered; but, even with the aid of this, it is still important to be able to test the correctness of opinions thus founded. To the young and inexperienced farmer it is still more important to be able to do so. This knowledge may be obtained by measurement, and easy calculation; or from tables constructed for the purpose, for the use of which the length and girth of the animal only are required.

The ascertaining of the weight of cattle by measurement is not a recent invention, tables for that purpose having been long in use. It may not, however, prove uninteresting to those who may not have turned their attention to the subject, to know on what data such calculations are founded. This will also, by explaining the whole process, enable the farmer to determine with more con-

fidence the value which he should attach to the results thus obtained. Even in this case a certain amount of experience is necessary. It is necessary, for instance, to know whether the animals are marketably fat or not; it is also necessary to be able to form an opinion as to the effects of any peculiarity of conformation in the animals, which might affect the results obtained by calculation. The kind of animals, too, must be taken into account, the formulæ on which the calculations are founded being strictly applicable to oxen merely; so that in the case of bulls, or cows which have had several calves, allowances are obviously to be made.

In calculating the net weight of cattle, it may be mentioned that the weight of the four quarters only is taken into consideration, the remainder being usually considered as offal, including the hide, tallow, and various other matters; and these, taken together, are computed to be equal in value to one of the quarters, or to one-fifth of that of the whole animal. The proportion between the live and dead weight, is the primary object to ascertain in our calculations. This was long calculated at one-half the live weight; but subsequent experiments on the more improved breeds of the country, showed that this was by much too small a proportion, it being more correctly represented by the fractional quantity ·605, the weight of the entire animal being assumed as 1. Having this datum, then, no difficulty is experienced in ascertaining the net weight from the gross weight; the latter being multiplied by ·605 will give the result, in the same denomination in which the gross weight is given. By these means the application of the steel-yard or weighing-machine at once effects the object, and this apparatus is accordingly frequently employed by amateur feeders to ascertain the progress of the different animals while fattening, as well as their value before being sold. In the case of experiments being made with the different kinds of food, their effects are easily tested in this manner; and even when only one description of food is consumed, the progress of the different animals is seen, when such as are not making a suitable return should be disposed of without delay.

This method of calculating the value of cattle is simple, and, were a weighing-machine found on every farm, it would be all that could be desired; but as these useful appendages are not always available, the same object may be obtained by measurement. The dimensions required are the length from the point of the shoulder to the hindermost point of the rump, and the girth or circumference taken immediately behind the fore-legs. That these dimensions may be taken accurately, the animal must be standing in a natural position, in which case they bring the body into the form of a cylinder, the capacity or solid content of which is easily ascertained; and, as in the former case, a certain proportion is found, from experience, to exist between the capacity thus obtained and the net weight. Strictly speaking, the form of most animals is such as to cause the girth to be rather eliptical than circular, but this departure from the cylinder being for the most part constant in all animals is, of course, taken into account in the formulæ by which the calculations are made. The length and circumference being then given, the rule to find the solid content is, to multiply the square of the circumference by the decimal, ·07958, the area of a circle whose circumference is unity, and this product again multiplied by the length, will give the solid content in the same denomination in which the dimensions were taken, and being usually in feet and inches, their result will be in cubic feet.

The capacity of the animal being ascertained, the next consideration is the estimation of the proportion between it and the nett weight; and this is only obtained by actual experiment, as in the case before under consideration, in reference to ascertaining the nett weight from the live weight, as obtained by the use of the weighing-machine. Suppose an Ox measures 7 feet in girth, and 6 feet in length, the capacity is found by the foregoing rule as follows:—$7\times7\times\cdot07958\times6=49\times\cdot07958\times6=3\cdot89942\times6=23\cdot39652$, which is the number of cubic feet in the animal. Now, let it be further supposed that the weight of this Ox, when slaughtered, was 70 stones, which, after repeated trials, is found to be the weight consonant with these dimensions, then the weight per cubic foot is of course found by dividing the total weight by the product thus obtained. For example, 70 divided by 23·39652, the quotient will be 2·993,—the precise proportion by which such calculations are usually estimated; so that for every cubic foot in the animal, ascertained as before directed, there will be 2·993 stones in the quarters alone. The rule, therefore, is to multiply the square of the girth by ·07958, and the product thus obtained by the length, which gives the capacity in cubic feet, which multiplied by 2·993, the number of stones to a cubic foot of the animal, gives the weight in imperial stones, as required. It will be observed, however, that the numbers ·07958 and 2·993 are both constant multiples in the operation, so that they may be multiplied together, and their product only used, which will materially shorten the operation. Thus, $\cdot07958\times2\cdot993=\cdot23818294$; but the number ·238 only may be taken, without incurring any appreciable error. Hence the rule for ascertaining the weight of an animal by measurement is, to multiply the square of the girth by the length, and this product again by the decimal ·238, which will give the weight of the quarters in imperial stones.

Such is the method of calculating the weight of cattle by measurement, and such are the data on which it is founded. As before observed, these calculations refer only to animals of the ordinary degree of fatness, so that in certain cases allowances must be made. In the case of animals very fat, perhaps one-eighteenth or one-twentieth should be added to the weight thus obtained; and when below the ordinary state of fatness, the same proportion should be deducted. A bull, from having more flesh upon the neck, should have probably one-twenty-fifth added; and in the case of old milch cows, for obvious reasons, one-tenth or one-twelfth may be deducted. It will be apparent, however, that the precise amount of these additions and deductions is not subject to rule.

The weight of the quarters being ascertained, there yet remains the tallow, hide, and other offal, to be taken into consideration in estimating the entire value of the animal. These, or a certain portion of them, are allowed the butcher for his profit; but this is chiefly regulated by the custom of the place—a circumstance which, of course, the farmer will not fail to take into account.

The preceding observations have occupied more space than I originally intended, but I hope the minuteness of detail will be excused, and that they will not altogether be uninteresting to those who have not hitherto directed their attention to the subject.—*J. Sproule.*

ON MINERAL AND INORGANIC MANURES.
No. XV.

By Professor Charles Sprengel.

(*Continued from page 267.*)

For the last 15 years I have chemically examined a great quantity of various marls, as far as their Agricultural qualities are concerned, of which the following are the results:

a.—Marl from Lüneberg (very powdery and ochre-yellow). 100,000 parts consist of

5,564	parts	silica and a little quartz-sand
0,412	,,	alumina
4,219	,,	protoxide and oxide of iron
0,006	,,	oxide of manganese
85,444	,,	carbonate of lime
1,255	,,	carbonate of magnesia
0,052	,,	potash and soda (combined with silica)
0,026	,,	common salt
0,066	,,	gypsum
0,318	,,	nitrogenous organic remains
2,328	,,	phosphate of lime (bone-earth)
0,010	,,	lime saltpetre
0,300	,,	bitumen
100,000	parts	

Of this very valuable marl only 100 cubic feet are used on one Madgdeburg acre of sandy heathy soil, containing much coal of humus, and it will yield without further manuring five to six plentiful crops; after which, however, the soil becomes thoroughly exhausted. If we now assume that the cubic foot of marl weighs 100 lbs., by 100 cubic feet, 10,000 lbs. will be brought on one acre, which consist of 8544 lbs. carbonate of lime, 125 lbs. of carbonate of magnesia, 232 lbs. of bone-earth, 32 lbs. of nitrogenous organic remains and lime saltpetre, nearly 7 lbs. gypsum, 2 lbs. common salt, 5 lbs. potash, soda, &c. As heathy soil is rarely deficient in potash and soda (united with silica), and as it also usually contains common salt and gypsum in sufficient quantity, the marl would still be active without any of these substances. We may therefore assume that it acts mostly by the bone-earth, the saltpetre, the nitrogenous substances, and the carbonates of lime and magnesia; which latter, however, are the most active, as they decompose the coal of humus, the more so, as they are found in the state of a very fine powder. It is also very probable that the protoxide of iron contained in the marl (of which there will be 422 lbs. in 100 cubic feet used on an acre), causes the formation of ammonia, as I have found by an experiment, that in a marl which had been left exposed to the air, ammonia has been formed after the lapse of a few hours. This seems not to have originated in the nitrogenous matter, as other experiments have proved that protoxide of iron will form ammonia, even without the presence of nitrogenous substances.

b. Marl from Osnabrück (stony, very hard, and greyish black). 100,000 parts consist of

23,030	parts	silica
9,970	,,	alumina
1,966	,,	oxide of iron and a little protoxide of iron
0,010	,,	oxide of manganese
34,980	,,	carbonate of lime
0,840	,,	carbonate of magnesia
7,272	,,	sulphuret of iron
20,528	,,	coal and a little bitumen
0,500	,,	phosphate of lime
0,843	,,	gypsum
0,060	,,	potash and soda, and traces of common salt
100,000	parts.	

After manuring with this marl, all crops succeed well on a sandy clay soil, but especially Clover, Vetches, Peas and Beans; which is chiefly to be ascribed to its great amount of gypsum and phosphate of lime: 400 cubic feet are conveyed on one acre, and it then acts for 20 years. The sulphuret of iron undergoes during the decomposition of the marl a successive decomposition; it is formed into sulphate of iron, and this is again decomposed by the lime, so that finally gypsum is formed. Consequently, these 400 cubic feet of marl will supply the soil for many years with gypsum. It cannot be doubted that the carbonates of lime and alumina act as a powerful nourishment, as the soil, on which this marl is best to be made, contains but little of both substances.

EXPERIMENTS WITH MANURES.

The following results were obtained last year in Surrey, on the estate of H. A. Aglionby, Esq., M.P., to whom we are indebted for the particulars:—

TURNIPS, 1843, ON A POOR CHALKY HILL.

No. I.—6 bushels of bone-dust	£0	13s.	6d.
1¼ cwt. of guano	0	13	9
[Pretty good crop.]			
No. II.—2¼ cwt. guano	1	7	6
[Just the same.]			
No. III.—¼ ton of Clarke's compost	1	16	3
[Came forward very quickly at first, greener than any in the field; but at last very inferior to either of the others.]			
No. IV.—5 cwt. Trimmer's compost	2	0	0
[So damp, it did not drill evenly; a very bad crop.]			
No. V.—1 cwt. sulphate of ammonia	0	18	0
5 bushels of bone-dust	0	11	3
20 lbs. nitrate of soda	0	3	3
[So damp, it did not drill evenly: the worst crop in the field—worse than if nothing had been used; as bad as the sulphate of ammonia alone on the other field of Turnips.]	£1	12	6
No. VI.—16 bushels of bone-dust	1	16	0
[Pretty good crop; about equal to Nos. I. and II.]			

TURNIPS, Sown May, 1843.—Measured and weighed in December. Land:—Part of field clay, with flints; remainder chalk, very poor.
